It is useful to distinguish three different themes in his realism. The first is a response to the problem of universals. Peirce argues that it is a mistake to understand realism about ‘generals’ or universals as a claim about the existence of a particular realm of curious abstract objects. Realists are committed to the objectivity of propositions concerning whether this or that object is a horse; they are not committed to the existence of horseness as a special particular. This view was most clearly expressed in an 1870 review of a new edition of Berkeley’s works where Peirce distinguishes two conceptions of reality, nominalist and realist. They differ in how they develop the uncontroversial claim that the real is ‘that which is not whatever we happen to think it, but is unaffected by what we may think of it’. Nominalists note that our thoughts are caused by sensations which are, in turn, caused by something outside the mind, and identify the real with these efficient causes of our sensations and thoughts. This picture of reality, which is closely allied to the representative theory of perception and the correspondence theory of truth, makes problematic the question of whether anything in reality corresponds to general conceptions such as ‘horse’ or ‘man’ and encourages the sort of mistrust of our conceptual interpretation of sensory input that makes Cartesian strategies attractive. Peirce favours the realist conception which notes that ‘to every question there is a true answer, a final conclusion, to which the opinion of every man is constantly gravitating’. Reality is the ‘final cause’ of inquiry, the answer to a question that we are ‘fated’ to reach if we inquire long enough and well enough.

This view of reality is reminiscent of Kant’s ‘empirical realism’, and encourages realism about generals because it is objective whether (for example) Pegasus was a horse. The account of reality obtained from the pragmatist principle supports this form of ‘realism’. However, since truth is explained in terms of the convergence of opinion, there is no conceptual gap between truth and what efficient, responsible inquirers would agree upon. The position thus appears to be in tension with the realist view that truth is not determined by what we take it to be. Moreover, a realist will presumably hold that there are many truths which inquiry will never uncover, all trace of them having

been lost. In the 1870s, Peirce suggested that this was a verbal matter of whether a diamond which was created and destroyed without being exposed to any sort of test was hard, but he later insisted that this was a mistake which his realism enabled him to avoid.

A second theme in Peirce's realism responded to this difficulty. Peirce's realism became more extreme in the 1880s when he defended objective modalities. Natural laws manifest real, natural necessity and there are facts concerning 'would-bes' - subjunctive conditionals concern what *would* occur in various counterfactual (but real) possibilities (see Laws, natural; Counterfactuals). The conditionals employed when we clarify a concept using the pragmatist principle are expressed in the subjunctive mood: they concern what would happen (or what would have happened) had certain actions been carried out. So in later work, Peirce's frequency theory of probability is transformed into a propensity view: the probability of an argument is the proportion of cases in which it *would* transmit truth from premises to conclusion.

Returning in 1906 to the example of the diamond which is destroyed before being tested for hardness, Peirce noted that science teaches that diamonds have in common a molecular structure which accounts for their hardness. We know that if it had been tested, it would have proved hard. The hardness of individual diamonds is not ontologically prior to the fact that diamonds (in general) are hard. This form of realism is connected to the reality of Thirdness. Since we directly experience Thirdness, we are directly aware of necessity or mediation. Peirce's synechism turns the question of realism into the question whether there is real continuity, real mediation.

The third theme reflects Peirce's answer to problems about reference which he faced during the 1870s: we directly perceive external things, referring to them demonstratively in perceptual judgments (see Reference). This allows for the possibility of reference to external objects (including theoretical entities) while being aware that some questions about their character have answers which will never be discovered by us. The irreducibility of Secondness is relevant here: we are aware of external things as reacting against us, as 'other'; and this is reflected in the fact that reference to external things is fundamentally indexical, involving demonstrative expressions in perceptual judgments. Theoretical entities are known to exist because they too possess Secondness - they react with other existing things.

10 Scientific metaphysics and evolutionary cosmology

In *The Monist* (1891-3), Peirce published a series of five papers which fit poorly with the anti-metaphysical flavour of his pragmatist writings. Developing themes that he had been exploring since 1883-4, they contained an evolutionary cosmology, which, he suggested, involved a form of objective idealism, and they argued, against Darwin, that this process of evolution should be seen as, in a sense, purposive: 'agapastic' evolution was driven by evolutionary love, and the universe is a vast mind perfecting itself through time (see Idealism). Some commentators, like Thomas Goudge (1950), attributed this work to a philosophical split personality: the naturalistic, tough-minded, anti-metaphysical pragmatist betrayed a taste for transcendental speculation which could not be reconciled with the rest of his work. Peirce himself was clearly sensitive to the need to show that the different elements of his philosophical vision formed a unity. His cosmology attempted to understand the most general features of our view of the world using the method of science. Metaphysics was empirical, differing from the special sciences only in its generality and in its avoidance of sophisticated experiment: its data was drawn from everyday facts whose very familiarity is likely to hide them from our notice.

He also insisted that his metaphysics was required by his work on logic and the method of science: self-controlled reasoning, employing the scientific method, was possible only if a Peircean metaphysics is possible too. In 'The Fixation of Belief', Peirce sought presuppositions of inquiry. He soon saw that showing that something was a presupposition of inquiry (or of a particular inquiry) did not establish its truth: at best, we are warranted in *hoping* that it is true. We must hope that there is a reality, independent of us, of which we can obtain knowledge, that the questions we investigate have answers, that we possess the freedom needed for logical self-control, that we can tell the difference between a good argument and a bad one, that we have the instincts posited in the 'primary abduction' and so on. We must look to metaphysics for the account of mind and reality that explains the truth of these hopes or regulative ideas. If no such account is possible, rational self-control is an illusion.

According to Peirce, the fundamental rule of logic is: 'Don't block the road of inquiry.' We should never assume that any question lacks an answer or that any regularity lacks an explanation: we should always hope that an

explanation is to be found. This led him, in 1883 and later, to set himself the task of explaining the fact that there are general laws. Nominalists take there to be brute regularities which have no explanation, and physical atomism appears to require this nominalistic picture. If all law and regularity can be explained, nominalism must be rejected and Peirce is committed to the rejection of metaphysical or physical atomism. Peirce's answer is to construct an evolutionary metaphysics which traces the evolution of law out of pure possibility (of Thirdness out of Firstness). And this evolutionary story enjoins that the universe contains pure chance (Peirce's 'tychism'): a generalizing tendency reinforces chance regularities and the universe becomes steadily more regular and ordered. Just as we acquire more and more habits as our hypotheses are confirmed and habits of expectation are reinforced, so the universe itself becomes more and more 'hidebound with habits' (see Determinism and indeterminism).

The analogy just offered is important for understanding Peirce's evolutionary story: our ideas of inference, purpose and the growth of knowledge - ideas linked to the practice of sign interpretation - provide the model we must use in making sense of the physical world. Problems of interaction show that we require a monistic system of metaphysics, and physicalism can make no sense of consciousness and other mental phenomena. Hence Peirce's view that the entire universe is a vast mind: laws are analogous to habits, and the ways in which laws determine events have to be understood by appeal to teleology and final causation. Physical events differ from ordinary mental events in being less flexible, being more 'hidebound with habits'. We arrive at a form of idealism which, although it does not make reality depend upon the contents of human minds or on its being known, still holds that our fundamental explanatory categories are those most familiar from ordinary psychological explanation. The evolution of law is not the mechanical and meaningless process described by Darwin. Peirce's evolution is 'agapastic': evolutionary love is manifested in the ways in which the universe becomes steadily more perfect. Against this background, it is no surprise that in 1908 Peirce published a 'Neglected Argument for the Reality of God'. He believed that the Universe was a vast mind, and that even those who explicitly defend atheism are likely to have a natural belief in this pantheistic god. It is manifested in a confidence that the Universe is steadily becoming more perfect, and in our sense that through contributing to science we contribute to 'the process of creation', to the growing rationality of the Universe.

CHRISTOPHER HOOKWAY

List of works

Although Peirce published extensively, he did not publish any major philosophical treatises summarizing his position. The following list samples some of the more important pieces, but inevitably it omits much that is significant: any list of 'major works', particularly after 1890, will be controversial and arbitrary. This material is all readily available in the first two collections, listed below.

Peirce, C.S. (1931-58) *Collected Papers of Charles Sanders Peirce*, ed. C. Hartshorne and P. Weiss (vols 1-6) and A. Burks (vols 7-8), Cambridge, MA: Harvard University Press, 8 vols.(A selection of papers and excerpts from manuscripts which was responsible for introducing Peirce's work to a wide audience. Since the material is organized thematically rather than chronologically and the texts are not all reliable, this edition is being superseded by *The Writings of Charles S. Peirce*.)

Peirce, C.S. (1982-) *The Writings of Charles S. Peirce: A Chronological Edition*, ed. M. Fisch, C. Kloesel, E. Moore, N. Houser *et al.*, Bloomington, IN: Indiana University Press.(A reliable and extensive selection of Peirce's published and unpublished writings, organized chronologically, and expected to run to thirty volumes. An indispensable tool for research, it is probably less useful for the new reader. The introductions to the different volumes provide an invaluable intellectual biography of Peirce.)

Peirce, C.S. (1992-4) *The Essential Peirce*, ed. N. Houser, and C. Kloesel, Bloomington, IN: Indiana University Press.(An excellent two-volume selection which contains reliable texts of all of Peirce's most important published and unpublished works.)

Peirce, C.S. (1867) 'On a New List of Categories', *Proceedings of the American Academy of Arts and Sciences* 7: 287-98.(A classic but difficult paper, containing the first published statement of Peirce's theory of categories. Reprinted as chap. 1, vol. 1 of Houser and Kloesel (eds) *The Essential Peirce*.)The first three of the following papers contain an attack on Cartesian approaches to philosophy, introduce Peirce's claim that all thought is in signs, and develop an account of truth and cognition on this basis. They are reprinted as chapters 2 to 4 of

Houser and Kloesel (eds) *The Essential Peirce*.
Peirce, C.S. (1868a) 'Questions Concerning Certain Faculties Claimed for Man', *Journal of Speculative Philosophy* 2: 103-14;(Challenges the Cartesian assumption that we can trust introspection as a source of information about the mind and denies that there are any 'intuitions', first premises for reasoning which are not shaped by earlier thoughts.)
Peirce, C.S. (1868b) 'Some Consequences of Four Incapacities', *Journal of Speculative Philosophy* 2: 140-57; (The first published statement of Peirce's semiotic - his claim that all thought is in signs - and his ideas about reality.)
Peirce, C.S. (1868c) 'On a New List of Categories', in Houser and Kloesel (eds) *The Essential Peirce*, Bloomington, IN: Indiana University Press, 1-10.(The first statement of Peirce's post-Kantian categorial scheme.)
Peirce, C.S. (1869) 'Grounds of Validity of the Laws of Logic: Further Consequences of Four Incapacities', *Journal of Speculative Philosophy* 2: 193-208.(Draws out the implications of the two previous papers for the explanation of the validity of inductive and deductive reasoning.)
Peirce, C.S. (1870) 'Fraser's *The Works of George Berkeley*', *North American Review* 113: 449-72.(A lengthy review which contains important discussions of realism versus nominalism (Houser and Kloesel 1992-4) and Peirce's conception of truth. Chapter 5 of this series of six papers is based on Peirce's attempt to write a logic text during the early 1870s. Although they are readable and extremely influential, the role of Peirce's theories of signs and categories is not made explicit. Available in chapters 7 to 12 of Houser and Kloesel.)
Peirce, C.S. (1877) 'The Fixation of Belief', *Popular Science Monthly* 12: 1-15.(Classic statement of Peirce's theory of inquiry, defending the method of science as a method for replacing doubt by settled belief.)
Peirce, C.S. (1878a) 'How to Make Our Ideas Clear', *Popular Science Monthly* 12: 286-302. (Introduces the pragmatist principle for clarifying concepts and ideas and uses it to explain the meaning of Reality.)
Peirce, C.S. (1878b) 'The Doctrine of Chances', *Popular Science Monthly* 12: 604-15(Uses the pragmatist principle to clarify our understanding of statements of probability.)
Peirce, C.S. (1878c) 'The Probability of Induction', *Popular Science Monthly* 12: 705-18. (Develops his view of probability and links it to an account of the success of inductive reasoning.)
Peirce, C.S. (1878d) 'The Order of Nature', *Popular Science Monthly* 13: 203-17.(Attacks Mill's defence of inductive reasoning and argues that the success of science requires that human beings possess 'innate ideas': due to natural selection, they are predisposed to arrive at the correct theories of the world.)
Peirce, C.S. (1878e) 'Deduction, Induction and Hypothesis', *Popular Science Monthly* 13: 470-82.(A formal and historical classification of the kinds of reasoning used in science.)
Peirce, C.S. (1887-8) 'A Guess at the Riddle', manuscript, 1887-8.(This manuscript elaborates Peirce's system of categories through showing how they are manifested in different fields of knowledge. Chapter 19 of Houser and Kloesel (1992-4).)Although occasionally hard and obscure, the first of the following five papers present the metaphysical system which Peirce had been developing throughout the 1880s. Reprinted as chapters 21 to 25 of Houser and Klousel (1992-4).
Peirce, C.S. (1891) 'The Architecture of Theories', *The Monist* 1: 161-76.(Discusses the proper approach to developing a system of metaphysics and describes the fundamental concepts to be used. His evolutionary cosmology is sketched and the importance of chance and continuity for an adequate philosophical system is emphasized.)
Peirce, C.S. (1892a) 'The Doctrine of Necessity Examined', *The Monist* 2: 321-37. (Criticizes the most common arguments for determinism and defends his 'tychism', the doctrine that the universe must contain absolute chance.)
Peirce, C.S. (1892b) 'The Law of Mind', *The Monist* 2: 533-59.(Introduces Peirce's 'synechism', the use of the idea of continuity in philosophy. The paper discusses the mathematical analysis of continuity as well as emphasizing its importance for understanding the mind.)
Peirce, C.S. (1892c) 'Man's Glassy Essence', *The Monist* 3: 1-22.(Applies Peirce's theory of categories and his synechism to the understanding of matter and the relations between mind and body: contains the suggestion that 'matter is effete mind'.)
Peirce, C.S. (1892d) 'Evolutionary Love', *The Monist* 3: 176-200.(Discusses the mechanisms of evolution, finally defending 'agapism', the doctrine that love is operative in the evolution of the universe.)
Peirce, C.S. (1898) *Reasoning and the Logic of Things*, ed. K.L. Ketner, Cambridge, MA: Harvard University Press.(An important series of lectures which provides a useful introduction to Peirce's work in logic and philosophy. As well as an important discussion of theory and practice, they contain clear introductions to some of his logical theories and a useful discussion of causation and continuity. Hilary Putnam's valuable

introduction contains useful information about Peirce's work on the mathematics of continuity.)
Peirce, C.S. (1903) *Pragmatism*, in *Collected Papers of Charles Sanders Peirce*, ed. C. Hartshorne and P. Weiss (vols 1-6), Cambridge, MA: Harvard University Press, 1931-58, vol. 5, 13-131.(Lectures to Harvard University philosophy department, which attempt to state and defend Peirce's pragmatism. They elaborate his views on phenomenology and the categories; logic, ethics and aesthetics as normative sciences; abduction and perceptual judgments; and realism. An important, though sometimes obscure source.)The first three of the following papers were part of an uncompleted series intended to 'prove' pragmatism. Manuscript drafts of later papers in the series survive.
Peirce, C.S. (1905a) 'What Pragmatism Is', *The Monist* 15: 161-81.(Clarifies Peirce's pragmatism, relating it to laboratory practice and christening it 'pragmaticism' to distinguish it fromWilliam James' position.)
Peirce, C.S. (1905b) 'Issues of Pragmaticism', *The Monist* 15: 481-99.(Contains important discussions of Peirce's mature realism and his critical common-sensism.)
Peirce, C.S. (1906) 'Prolegomena to an Apology for Pragmaticism', *The Monist* 16: 492-546.(An introduction to Peirce's 'existential graphs', a system of formal logic which is to have a fundamental role in the unfinished proof of pragmatism.)
Peirce, C.S. (1908) 'A Neglected Argument for the Reality of God', *Hibbert Journal* 7: 90-112.(An interesting argument for God's reality which is intended to fit Peirce's account of the method of science.)
Eisele, C. (ed.) (1976) *The New Elements of Mathematics*, The Hague: Mouton.(A five-volume anthology of Peirce's contributions to mathematics and mathematical logic.)
Hardwick, C. (ed.) (1977) *Semiotic and Significs*, Bloomington, IN: Indiana University Press.(This contains Peirce's correspondence with Lady Welby and is an important source for his work on signs.)

References and further reading

The secondary literature on Peirce is now enormous and the list below omits much that is interesting and important. The most important source of journal articles is the quarterly *Transactions of the Charles S. Peirce Society*.

Pelagianism

Pelagius, a Christian layman, was active around AD *400. The thesis chiefly associated with his name is that (i) human beings have it in their own power to avoid sin and achieve righteousness. Critics objected that this derogates from human dependence on the grace of God. Pelagius did not deny that the power to avoid sin is itself a gift of God, an* enabling *grace; but he was understood to deny the need for* cooperative *grace, divine aid in using the power rightly, or at least to assert that (ii) such aid is a reward for human effort, and so not an act of grace. Later thinkers who held that God's aid, though not a reward, goes only to those who do make an effort, were accused of believing that (iii) there is no need of* prevenient *grace in causing the effort in the first place. So Pelagianism is a tendency to magnify human powers: its defenders saw it as a (frightening) challenge to humans, its detractors as an insult to God. It was hard without Pelagianism to find a place for free will, or with it for original sin.*

1 Pelagius

Pelagius lived from around 360 to after 418, came from Britain, moved to Rome as a young man, and was later active in Palestine. Rome in the Christianized empire of the 380s had become an administrative backwater (the Western capital having moved to Milan) in which families with glorious names cultivated the memory of their pagan past. Even so, Christian adherence was beginning to be prudent and fashionable; and Pelagius, finding that the new religion often sat lightly on these people, formed - or more likely joined - a puritan group which propagated Christianity as a complete change of life. He insisted that each time you confront a choice you have the possibility of making the right one; and (a stronger claim) that you have the possibility of making the right choice always - the possibility of perfection, sinlessness. The bonds of habit do not excuse. God has fashioned commandments that are suitable to our condition. No one should complain 'like insolent and incompetent servants, "It's too much, it's too difficult, we're only human, there's a limit to what a person can cope with"' (*Ad Demetriadem* 16).

This power to act aright comes by God's grace, that is, as a favour, and in particular through Christ, who 'delivered us from the wrath of judgment by remitting sins, and by his teaching and example' (*Expositiones*, on 1 Thessalonians 1: 10). Human perfection is not an immunity to sin, let alone the antinomian licence to do anything whatever blamelessly; on the contrary, one must keep 'running' (*Ad Demetriadem* 27). Under pressure from critics, Pelagius was willing to 'denounce anyone who believes or says that the grace of God by which "Christ came into this world to save sinners" [1 Timothy 1: 15] is not necessary in each hour, in each moment, in each act that we do' (reported in Augustine, *De gratia Christi* 2.2). But right action is always possible; as he said in a phrase gently mocked by Augustine, 'We are unable to be unable to be unsinners' (*De natura*, quoted in Augustine, *De natura et gratia* 49.57).

2 The reaction

Neither in this nor his other opinions was Pelagius conscious of innovation, but he came under attack from two redoubtable controversialists, Jerome (*c*.342-420) and Augustine (§§6, 13). Jerome, unfairly equating sinlessness with Stoic 'apathy' - emancipation from appetites such as hunger - accused (perhaps counter-accused) him of being tainted with the views of the earlier Church Father Origen, who had lately come under suspicion of heresy. By this time Jerome and Pelagius were neighbours in Palestine, where Pelagius had fled before the impending sack of Rome by the Visigoths in 410. Passing through Carthage in his flight, Pelagius had left there a colleague, Coelestius, whose views on baptism came to Augustine's ears along the African coast at Hippo. Pelagius in Palestine was accused of heresy in 415, but acquitted. The Africans appealed, and in 418 an imperial rescript banned the expression of support for Pelagians and exiled their leaders from Rome, whose bishop Zosimus, after wavering, issued a (lost) ecumenical letter of condemnation. From that time Pelagianism has been a heresy.

The nature of a heresy is defined by the decrees of the Church, not the opinions of its supposed adherents. The Pelagian heresy consists mainly of two parts, both of which Augustine attempted (in his voluminous extant writings on the affair) to fasten on the members of Pelagius' circle and to refute: restriction of the scope of grace, and denial of original sin. On grace, a council held at Carthage in 418 condemned three graded errors: that God's grace is of no avail in aiding people not to sin; that it gives such aid but only by instructing and is not the means of

having the motive and the strength not to sin; and that it aids obedience to God's law but only by making obedience easier (Denzinger and Schoenmetzer 1967: 225-7). On original sin the same council declared it heretical to deny either that Adam's sin is transmitted to his progeny or that infants who die unbaptized will suffer in hell (Denzinger and Schoenmetzer: 223-4). Pelagians had argued that since only avoidable deeds are sinful, infants must be sinless and their baptism cannot be for the remission of sins.

3 Massilians

Under these blows the Pelagian movement lost impetus. But in Augustine's last years a moderated form of it arose which even after his death continued to trouble his follower Prosper of Aquitaine (*c*.390-*c*.463). People were saying, Prosper anxiously reported to Augustine, that 'all effort is abolished, all virtues destroyed, if God's arrangements precede [in the old sense, 'prevent'] human wills, and under the name of predestination a kind of fatal necessity is introduced' (*Epistula* 225.3). Pelagius had held that predestination 'is the same as foreknowledge' (*Expositiones*, on Romans 8: 29). But if it is causative, 'preventing' the will, how can the will be free? A number of monastic communities felt the same way, especially in southern Gaul. According to John Cassian of Marseilles (Massilia): 'We acknowledge that human efforts cannot secure it [perfection] by themselves without the aid of God; on the other hand we insist that only people who work and sweat receive God's mercy and grace' (*De institutis* 12.14) Even if one cannot succeed without help, one must be able to try on one's own: anything else would impose fatalism. It was left to later centuries to worry over Augustine's unsatisfactory response to this problem; meanwhile the defiance of these 'Massilians' was eventually condemned at a council at Orange in 529.

4 Ockhamists

In Western Christian controversy, accusations of Pelagianism have never died out; but we must now skip to the fourteenth century. William of Ockham wrote: 'As to Pelagius' error, I say that his view was that everyone has the power, from what is purely natural to him, to avoid every sin, actual and original, and to merit eternal life as his due [*de condigno*]' (*Dubitationes addititie* AA-BB; Leff 1975: 494 n.208). Ockham is applying a distinction foreign to Pelagius' lifetime, between 'condign' and 'congruous' merit. You merit something *de condigno* when it is your due, *de congruo* when it is merely fitting or 'meet' (article 13 of the 39 Articles of the Church of England) (see Sanctification §2). He ascribes to Pelagius the view that human beings before grace already have the power to *earn* salvation. The ascription is unhistorical, but Pelagius does seem committed, as the Massilians also were committed, to the weaker thesis that fallen human nature suffices to make God's cooperative aid a fitting reward for good human effort; to 'do what is in you' is a 'congruous merit'. This was Ockham's own position (in his language); so that it is not surprising that an attack on him and others by his Oxford contemporary Thomas Bradwardine (§3) should have been entitled *De causa Dei contra Pelagium*. Ockham's special contribution had been to maintain that even the fittingness of reward for good effort depends on God's valuing the effort; God might have preferred a will such as Satan's (see William of Ockham §10). Nevertheless, grace is a response; even if not subsequent to the good will in time, it is conditional on it, and thus not prevenient in the sense demanded by the council of Orange. Bradwardine (and Luther, who later concurred) had reason for his label.

5 Grace and free will

During the sixteenth and seventeenth centuries interest in Pelagianism was kept alive by the perceived difficulty for its opponents of reconciling grace with free will. Erasmus, unfriendly to Augustine, defended free will against Luther. According to Calvin, every champion of free will is an enemy of prevenient grace, and so guilty of the Massilian error which was now called semi-Pelagianism. But two ways out were sought by others. The heretical Roman Catholic bishop Jansen, rabid Augustinian, argued that spontaneity is enough for freedom: fallen man is subject to 'the necessity of sinning' (1640, 'De statu naturae lapsae' 3.11), but free will is compatible with necessity because everything is in our power which 'happens when we will' (1640, 'De gratia' 6.5 264a B). Arminius, inspirer of the breakaway Remonstrant movement among Dutch Calvinists, preferred a solution that had meanwhile been urged by Spanish Jesuits, notably in Molina's brilliant *Concordia*: although free will excludes necessity, causes - even divine ones - do not necessitate, so that prevenient grace is not 'irresistible' (1629: 4.122b; 1825 (I): 600) even when 'efficacious' (see Molina, L. de §§1-3). What had turned out to be the major conceptual tangle in the Pelagian question was thereafter bequeathed, without its identification of God's will as

first cause, to the attention of secular philosophy.

Perception

Sense perception is the use of our senses to acquire information about the world around us and to become acquainted with objects, events, and their features. Traditionally, there are taken to be five senses: sight, touch, hearing, smell and taste.

Philosophical debate about perception is ancient. Much debate focuses on the contrast between appearance and reality. We can misperceive objects and be misled about their nature, as well as perceive them to be the way that they are: you could misperceive the shape of the page before you, for example. Also, on occasion, it may seem to us as if we are perceiving, when we do not perceive at all, but only suffer hallucinations.

Illusions and hallucinations present problems for a theory of knowledge: if our senses can mislead us, how are we to know that things are as they appear, unless we already know that our senses are presenting things as they are? But the concern in the study of perception is primarily to explain how we can both perceive and misperceive how things are in the world around us. Some philosophers have answered this by supposing that our perception of material objects is mediated by an awareness of mind-dependent entities or qualities: typically called sense-data, ideas or impressions. These intermediaries allegedly act as surrogates or representatives for external objects: when they represent aright, we perceive; when they mislead, we misperceive.

An alternative is to suppose that perceiving is analogous to belief or judgment: just as judgment or belief can be true or false, so states of being appeared to may be correct or incorrect. This approach seeks to avoid intermediary objects between the perceiver and the external objects of perception, while still taking proper account of the possibility of illusion and hallucination. Both responses contrast with that of philosophers who deny that illusions and hallucinations have anything to tell us about the nature of perceiving proper, and hold to a form of naïve, or direct, realism.

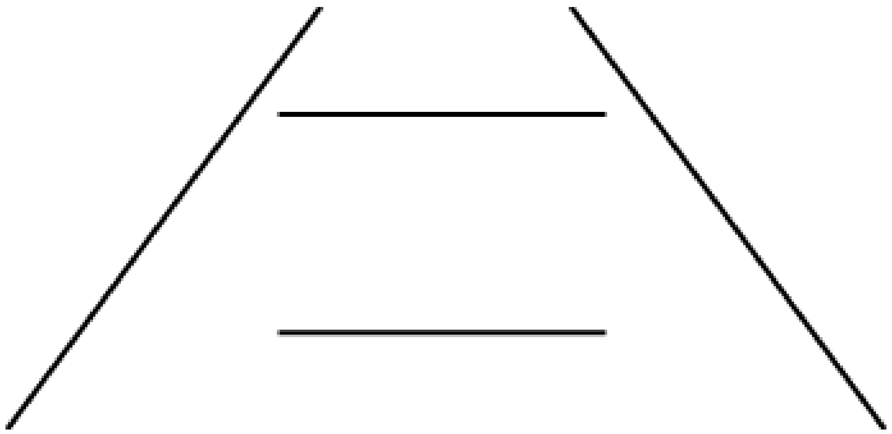
The account of perception one favours has a bearing on one's views of other aspects of the mind and world: the nature and existence of secondary qualities, such as colours and tastes; the possibility of giving an account of the mind as part of a purely physical, natural world; how one should answer scepticism concerning our knowledge of the external world.

1 Perception, objects, appearance and illusion

We perceive objects, features of objects, and events: I can see a lilac bush, notice the texture of a piece of velvet, hear an explosion. We can also perceive facts, that things are a certain way: I may see that there are three empty coffee cups in my office, or smell that the milk has gone off. When we perceive things, they appear a certain way to us and we come to acquire knowledge concerning them, but one can also perceive facts without perceiving any object in particular: scanning the horizon you might see that there is nothing at all in your vicinity; you have perceived that something is the case, but there is no object that you have seen.

Objects can vary in their appearance: how something looks to you depends on the point of view from which you see it; how things appear to you depends on the conditions under which you perceive, for example whether the lighting is good; and they depend on your powers of perception, for example how much you can smell or taste may depend on whether you have a cold. The same object may appear differently to different observers. Furthermore, you may not only perceive different aspects of an object from others, you may misperceive it, or suffer an illusion concerning it.

One misperceives something where one does perceive it, but it appears differently to one from how it really is. Misperceptions occur in different ways: one might mistake a clump of grass for a rabbit; in odd lighting the walls of a room may look peach, even when they are really off-white; one may be subject to illusions due to disease. Other examples of illusion happen in normal conditions of perception to all perceivers. Here is one example, common in psychology text books, called the Ponzo illusion:



The two horizontal lines are in fact the same length, even though the top one looks longer. Psychologists and neuroscientists are adept at causing other illusions as well: in one alarming example, subjects are made to feel as if their noses are growing back into their heads.

It is also possible to bring about hallucinations. These are cases in which it seems to subjects as if they are really seeing or feeling something, when in fact they are seeing nothing at all. They are most commonly caused by psychological disturbance, but it is also possible to bring them about through appropriate stimulation of the brain: apparent sightings of lights, called phosphenes, arise from stimulation of the visual cortex.

Philosophers tend to draw the same conclusion from all these of kinds of example: it is possible for things to seem a certain way to you, even if they are not that way. Just as one cannot determine from the object of perception how things appear to a perceiver, so one cannot determine from how things appear to a perceiver what the object of perception is, or even whether there is such an object. This implies that an account of perception involves two distinct tasks: on the one hand, it needs to explain what perceptual experience is, the state of mind when things sensorily appear a certain way to one; on the other, it needs to explain what it is for such an experience to be a genuine perception of some object, as opposed to a mere illusion or hallucination.

Under what conditions is a perceptual experience the perception of a given object? One might think that how things appear must match the object in some respect, but there seems to be no particular respect in which I must perceive correctly in order to perceive an object: one can misperceive the colour, shape, location, taste, smell or texture of things. Even if how things appear to me matches perfectly the scene before me, I do not necessarily perceive the scene: if a scientist has induced a visual hallucination in me as of an orange, merely placing an orange in front of my blindfolded eyes will not thereby make me see it. In response to such examples of veridical hallucination, some philosophers have suggested that one can perceive an object only if it causes one's perception of it. This condition is not sufficient by itself to distinguish veridical hallucinations from perceptions: the orange before my blindfolded eyes may be resting on the switch of the machine inducing the hallucination. Various attempts have been made to refine the causal condition in order to give a complete account of the difference between hallucination and perception, but none as yet seems entirely satisfactory in explaining our ability to discern a difference between the two.

The basic task for any theory of perceptual experience is to explain the following. In perceiving, things appear to you a certain way. For example, when you see a red patch on the wall in front of you, it can look to you as if there is a red patch there. In such a case, where you perceive things to be the way that they are, a case of veridical perception, a description of what your experience is like - that is, of how things appear to you - is also a true description of what you can see. In this case, it seems as if a description of your experience is also a description of the things in the world which you can perceive. However, you could have an experience just the same for you even if you were having an illusion, and not seeing something red, or a hallucination and not seeing anything at all. In either case, you would be inclined to give the same description of your experience as in the veridical case, but in neither would the description be true of what was before you in the world, since no red patch would be there. So, how can it be correct to describe your experience in terms of objects in the world, when the description can be true when applied to your experience, but false when applied to the world? This is the question which lies behind the so-called argument from illusion, and different theories of perception answer it in different ways.

2 Sense-datum theories of perception

Some philosophers claim that we are not aware, or anyway not immediately aware, of objects in the world around us, but only of things which depend on the mind for their existence and nature. Suppose that there is no red patch on the wall before me, but that a neuroscientist has so affected my brain that it looks to me as if there is a red patch before me. One might think that it could only appear to me as if some red thing was before me, if there actually was something red of which I was aware. Since the neuroscientist can give me the hallucination just by affecting my brain in the right way, it seems as if bringing about the experience was sufficient for there to be such a red patch for me to be aware of. At least in the case of hallucination, I would be aware of an entity which depended for its existence on my awareness of it; philosophers have used the term sense-datum, for such entities (see Sense-data).

The hallucination could be just the same for me as the experience I would have were I actually looking at a physical red patch on the wall. And the neuroscientist could be bringing this about by stimulating my visual cortex in just the way it would be stimulated if I was looking at the wall. So, it may seem plausible to suppose that my hallucination is of the same sort as the experience I would have were I genuinely perceiving. If the hallucinatory experience is of a kind which involves being aware of a sense-datum, then even in the case of veridical perception I will be aware of such a mind-dependent entity. Hence we arrive at the sense-datum theory of experience: that we are aware of mind-dependent entities in all perceptual experience.

One criticism of this line of thought is that it involves a form of fallacious reasoning. If I believe that there are fifteen elephants in the next room, it does not follow that there are fifteen elephants in the next room which I believe to be there - after all, my belief may be false - so it would be a mistake to accept the latter claim on the basis of the former. Critics suggest that in the above claim, when one moves from the uncontroversial claim that it looks to me as if there is a red patch before me, to the conclusion that there is a red patch which looks to be before me, just such a mistake in reasoning has been made. However defenders of sense-datum theories of perception would agree that the claim does not follow simply as a matter of logic. Rather, they claim that we can only offer an adequate explanation of what experience is like, if we accept that the latter claim is true when the former is.

How good an explanation of what experience is like does this offer? The theory is committed to claiming that when things appear a certain way to you, then some sense-datum actually is that way. Suppose it seems to you as if there is a rabbit in the field before one, is one then aware of some mind-dependent bunny? In order to resist this conclusion, the sense-datum theorist needs to restrict the range of qualities which can strictly be apparent to us; namely to only those which sense-data might plausibly be thought to have. In the case of vision, this has traditionally been restricted to colour, shape and size (there is some dispute over whether visual data are located in a two-dimensional or a three-dimensional visual space). Hence, it could not strictly look (in the relevant sense) as if a rabbit was before one, only as if something rabbit-shaped were there.

If appearances are to be accounted for solely in terms of mind-dependent entities, what connection holds between experience and the objects of perception, such as the rabbit? Representative theories of perception typically hold that material objects are the indirect or mediate objects of perception in virtue of reliably causing our experiences of sense-data. I can perceive the rabbit in front of me, because the visual experience of something rabbit-shaped is caused by the rabbit. One traditional objection to representative theories of perception is that they lead to scepticism concerning the external world (see Scepticism). In response, some philosophers adopt an alternative view of the connection between objects of perception and experience, taking physical objects to be no more than constructions out of mind-dependent entities or experiences (see Phenomenalism; Idealism §2). Few philosophers find this position acceptable. Must a sense-datum theorist choose between scepticism and idealism? One may deny that representative theories of perception introduce any special sceptical problems. Whether this is so or not, depends on whether sense-data should be thought of as cutting us off from the external world, as a veil of perception, rather than providing us with our only access to the world.

Are the metaphysical implications of the sense-datum theory acceptable? It requires us to accept that in addition to such familiar things as rocks and chairs, and discoveries such as black holes and neutrinos, there are mind-dependent objects which come into and go out of existence as each person has an experience. Philosophers have complained that such entities must be inherently mysterious and that we can discern no readily agreed method of determining when one has the same or a different sense-datum. Furthermore, their existence would rule

out explaining how the mind comes to be part of a purely physical, natural world (see Materialism in the philosophy of mind).

Some philosophers have thought that these worries would be lessened if we eliminated inner objects of awareness, and appealed instead simply to ways in which one senses. According to this view, when one senses a red patch, one should not suppose that there has to be some object, a patch which one senses, but rather that one senses redly or in a red manner. One might compare this to singing a lullaby: we need not suppose that there is some thing which the singer sings, rather that they have sung in a certain, quieting manner. Where the sense-datum theory posits inner objects and qualities in order to explain the character of perceptual experience, this adverbial theory of experience appeals just to the manners or qualities of experiencing, sometimes called qualia, subjective qualities or sensational properties of experience (see Mental states, adverbial theory of).

Critics of the adverbial theories have pointed out that we make a distinction between on the one hand sensing a red square and green triangle, and on the other sensing a green square and a red triangle. It is difficult to explain this difference without appealing to the idea that an object is both square and red in the one case, and square and green in the other. There seems to be no sense in which a state of mind, or a sensing, could literally be square or round.

There is a further objection to be made from how we describe our experiences which applies to both adverbial and sense-datum theories. Various philosophers have denied that introspection of one’s visual experience reveals the mind-independent objects which one perceives, and the features which one perceives them to have. Our experience of the world is diaphanous or transparent: introspection of it takes one through to the objects and features in the world, much as in staring at a pane of glass head on, one’s attention is taken through to what lies beyond it.

The objection has two aspects to it. On the one hand, there is a negative claim that no introspective evidence can be found for the existence of mind dependent objects or qualities. Since such things are introduced as just that of which one is aware, one might expect that if there are such things, they should just be obvious through introspection. It is not evident that this negative claim is correct: opponents have claimed that evidence for them is provided by the example of after-images; or in the way that a nearer object can fill up more of one’s field of view than a more distant object, even though both look the same size; or in our awareness of the fact that we are seeing the shape of an object rather than feeling it. Whether such examples really do demonstrate the existence of subjective qualities is a matter of further dispute, but the other element of the transparency objection can be made without having to settle that matter. It points out a positive element of the character of experience, as revealed through introspection, namely that mind-independent objects of perception are there in your experience. An account of experience which appeals solely to sense-data and qualia would not predict that these mind-independent elements should be part of our experience.

One reply to this is to deny that perceptual experiences really do have this diaphanous character. So, it has been suggested that we describe an experience as of a cube merely in order to indicate the typical cause of such experiences. But this suggestion is implausible. We do sometimes pick out experiences indirectly by reference to their typical cause, as when we call a certain distinctive pain a nettle sting. In this case it does not seem as if the term nettle should be applied directly to a description of what the pain is like. But one may claim that visual experience is not like that, the description of experience as of something red, or square, or hard involves applying those terms directly to what one senses.

The objection is more pressing against adverbial theories than sense-datum theories. We describe our visual and tactual experiences in terms of shape properties. As noted above, a sense-datum theorist will dispute whether we also have to describe our experiences in terms of other qualities which could only be the properties of material objects. However, even if the objection is not decisive, it has been influential as a motivation for an alternative account of perceptual experience.

3 Intentional theories of perception

If it can seem to me that there is a red patch on the wall in front of me, when nothing physical is there, and the patch in question seems to be a part of the objective world external to me, then perhaps it can seem to me as if something is so, without anything actually having to be that way. We are all familiar with the fact that one may think that something is the case, when it is not so, as when one believes England will win the World Cup at cricket, and one may think about something, even if it does not really exist, as when small children hope that Santa

Claus will visit their house that night. An intentional theory of perception claims that the case of perceptual experience is parallel to these examples: perceptual experience is intentional, and allows for incorrectness in its content, and non-existence of its objects in just the way that beliefs and judgments may do so (see Intentionality).

When it appears to one as if there is a red patch before one, one's experience represents the world as containing such a patch. If there is no patch there, how one's experience represents the world to be is incorrect, and one's experience is illusory. If the object of one's experience is non-existent, like Santa Claus, then one's experience is a hallucination and not the perception of anything. For the intentional approach, experience is ascribed a representational content which may be correct or incorrect; the experience is veridical, or illusory depending on the correctness of this content. What the experience is like for the subject, as revealed through reflection on it, is to be explained by that representational content. It is important to note that the intentional theory does not introduce the representational content of experience as an object of awareness, in the way that a sense-datum theory introduces sense-data as objects of awareness. Rather, the intentional theory claims that, in the case of perceiving, the objects of awareness are the mind-independent objects that one perceives, and which one's experience represents to be present. In the case of hallucination, there are no objects of awareness, but the character of experience is just the same as that in the case of perception: in both cases it is to be explained by the representational content that the experience has. So the intentional theory offers an account not of the objects of awareness, but rather the mode in which we can be aware of objects in the world.

How like belief could experience be? One view is that we can identify experience with the acquiring of beliefs, or with dispositions to acquire belief. A problem for this suggestion is that one can disbelieve one's senses. Those familiar with the Ponzo illusion do not believe that the top line is longer, but it still looks longer. A belief theory of experience may respond to this example by claiming that you are still disposed to believe that the top line is longer, it is just that other beliefs you have prevent you forming that belief. But this response is not really satisfactory: when you look at the illusion, you then have an experience which could have led to the belief in question; no mere disposition to acquire a belief can be identified with an occurrent state of mind which interacts with one's other mental states.

This suggests that experiencing is not believing, but one might still claim that both states have the same representational content. That claim has also been denied. For the conditions needed for thinking something may be different from the conditions for having certain kinds of experience: it seems conceivable that we can have the same experiences as infant humans or as other animals, but they cannot share the same thoughts as us; our beliefs are expressible linguistically, and rest on sophisticated conceptual abilities which neither infants nor other animals need have. One may also claim that the character of experience is too rich to be encompassed by any one set of categories, or set of concepts that one can bring to bear on it. For these, and related reasons, some philosophers have claimed that the content of experience is different from that of thought or belief in not being purely conceptual: experience has a non-conceptual content as well (see Content, non-conceptual).

Is this sufficient to explain the character of experience, and the differences between experiencing things to be a certain way and merely believing or thinking them to be that way? Many philosophers have thought not. They have insisted that there must be some form of non-representational quality to experience in addition to any representational content it may have (see Qualia). The issue here returns us to the first part of the transparency objection to sense-datum theories: it is an open question whether there are evidently subjective, or qualitative aspects of experience other than how the world is presented to us. If one accepts that there are, then there is more agreement than one might initially have supposed between traditional sense-datum theories, which supplement awareness of sense-data with interpretation, and alternatively intentional theories, which supplement representational content with subjective qualities.

4 Naïve realism and disjunctive theories of appearance

Sense-datum theories of perception appeal to illusions and hallucinations in arguing for the existence of inner objects of perception, and intentional theories of perception appeal to illusions to justify the view that experience is representational. But there is a strand of philosophical criticism which denies that one can draw any conclusion about perception from cases of illusion and hallucination. One motive for such criticism is an endorsement of a certain kind of naïve, or direct, realism concerning perception.

Defenders of sense-datum theories claim that the best account of experience commits one to thinking that one can sense a quality only if there actually is an instance of that quality which one senses - the argument from illusion then leads them to suppose that such qualities must be mind-dependent; defenders of intentional theories claim that the best account of experience commits one to thinking that experience is directed at, or of, mind-independent objects - the example of illusion leads them to claim that one's experience merely represents these things. A naïve realist might endorse both the initial claim of the sense-datum theorist and that of the intentional theorist, while trying to resist their conclusions: on this view, when one perceives, one is aware of some mind-independent objects and their features, and such objects and features must actually be there for one to have such an experience. This cannot be true of cases where there is no appropriate physical object of perception, as in hallucination, so the naïve realist must claim that the account applies only to cases of perception. Hence they must deny that the state of mind one is in when one perceives something is of a sort which could have occurred even were one having an illusion or hallucination. They must claim that when it appears to one as if there is a red patch there, then either there is a red patch which is apparent to one, or it is merely as if there were such a red patch apparent to one: nothing more need be in common between the situations, such as an inner object of which one is aware, or a representational content. The view, which we can call a disjunctive theory of appearances, claims that perceptual experience does not form a common kind of state across perception, illusion and hallucination.

The view has been thought objectionable for a number of reasons. First, as all sides agree, for any perception one has, one could have a matching illusion or hallucination which one could not distinguish from the perception. According to the disjunctive view, there is a genuine difference here, but how can there be a difference in the conscious state of mind which the subject is unable to detect? The disjunctive view is committed to claiming that we can be misled about the kind of conscious state we are in; indeed one might sum up the view as claiming that illusions and hallucinations mislead one not only about objects in the world, but about themselves as well.

Second, the same brain activity as can bring about perceptions can bring about hallucinations. Furthermore, any physical outcome a case of perceiving can produce, for example kicking a ball, could equally well be caused by a matching hallucination. So the disjunctive view must claim that there is a real difference between experience which is a perceiving and one which is a hallucination even though there is no causal difference between them. But many philosophers claim that there can only be a real difference between things where they differ in their causal powers. It remains a matter of dispute whether the consequences of the view are unacceptable or the objections without answer - a similar set of arguments attends debates about the nature of content and thought (see Content: wide and narrow).

Yolton, J. (1984) *Perceptual Acquaintance from Descartes to Reid*, Minneapolis, MN: Minnesota University Press.(A discussion of the history of philosophy of perception which questions the popular attribution of representative theories of perception to various early modern philosophers, including Descartes and Locke.)

Perception, epistemic issues in

We learn about the world through our five senses: by seeing, hearing, smelling, tasting and feeling. Sense perception is a primary means by which we acquire knowledge of contingent matters of fact. We can also acquire such knowledge by, for instance, conscious reasoning and through the written and spoken testimony of others; but knowledge so acquired is derivative, in that it must be based, ultimately, on knowledge arrived at in more primary ways, such as by sense perception.

We can perceive something without acquiring any knowledge about it; for knowledge requires belief, and we can perceive something without having any beliefs about it. Viewing any but the most simple visual scenes we see many things we form no beliefs about. However, when we perceive something, we are acquainted with it by its sensorially appearing (looking, sounding, smelling and so on) some way to us. For we see something if and only if it looks some way to us, hear something if and only if it sounds some way to us, and so on. When, based on how they appear, we form true beliefs about things we perceive, the beliefs sometimes count as knowledge.

Often the way something appears is the way it is. The red, round tomato looks red and round; the sour milk tastes sour. But the senses are fallible. Sometimes the way something appears is different from the way it is. Appearances can fail to match reality, as happens to various extents in cases of illusion. There are, for instance, optical illusions (straight sticks look bent at the water line) and psychological ones (despite being exactly the same length, the Müller-Lyer arrows drawings look different in length). In such cases, looks are misleading.

The ever-present logical possibility of illusion makes beliefs acquired by perception fallible: there is no absolute guarantee that they are true. But that does not prevent them from sometimes counting as knowledge - albeit fallible knowledge. Recognitional abilities enable us to obtain knowledge about things from how they perceptually appear. Sense perception thus acquaints us with things in a way that contributes to positioning us to acquire knowledge about them. The central epistemic issues about sense perception concern its role in so positioning us.

1 Perceptual knowledge is perceiving-that

Sense perception plays at least some role in the acquisition of virtually all our empirical knowledge. Are there any cases of factual knowledge that deserve the label ‘perceptual knowledge’? Sensorially perceiving that *P* is a way of knowing that *P* (in part) by perceiving, and for this reason is fairly standardly taken to deserve that label. Thus it is held that one has visual knowledge that *P* if and only if one sees that *P*, auditory knowledge that *P* if and only if one hears that *P*, and so on: one might see that the light has turned green; hear that the piano is out of tune; smell that the milk is sour; taste that there is garlic in the food; or one might feel the tomato is over-ripe.

We speak of seeing-whether, seeing-when, seeing-where, seeing-how, seeing-who and seeing-which. These all involve seeing-that. For example, one sees whether there is a chair in the room if and only if one sees that there is a chair in the room or one sees that there is not a chair in the room. One sees where the corkscrew is if one sees, for instance, that it is on the table; and one sees who is at the door if one sees that it is Tom. (These claims generalize to the other senses.)

When one sees, hears, smells, tastes or feels that *P*, one believes that *P*, and *P* is true. What distinguishes these ways of perceiving that *P* is the perceptual means by which the belief is acquired or sustained - whether it is by seeing and so on - and the perceptual means of acquisition of at least some of the evidence on which the belief is based.

2 The primary-secondary perceiving-that distinction

It is possible for one to perceive that *A* is (has/would) *F* by perceiving that *B* is *G*, when *A* is distinct from *B* and/or *F* is distinct from *G*. One might, for instance, hear that the alarm clock is ringing by hearing that a ringing sound is coming from the bedroom; smell that the toast is burning by smelling that a burnt odour is coming from the toaster; taste that the wine is from southeastern Australia by tasting that it has such-and-such a taste; or see that the branch would support one’s weight by seeing that it has a certain thickness. In such cases, perceiving that *B* is *G* is part of the constitutive means by which one perceives that *A* is *F*: the way one perceives that *A* is *F*, how one perceives that *A* is *F* is, in part, by perceiving that *B* is *G*. Moreover, that *B* is *G* - something one perceives to be the case - is

part of the evidence on which one's belief that *A* is *F* is based.

Fred Dretske (1995) has drawn a useful technical distinction between primary and secondary cases of perceiving-that *A* is (has/would) *F*. One secondarily perceives that *A* is *F* if and only if one perceives that *A* is *F* by perceiving that *B* is *G*, where *A* is distinct from *B* and/or *F* is distinct from *G*; one primarily perceives that *A* is *F* if and only if one perceives that *A* is *F*, but not secondarily.

A striking feature of secondarily perceiving that *A* is *F* is that it does not require perceiving *A*. One might see that the fuel tank is empty by seeing that the gauge reads empty, and thus without seeing the fuel tank itself. In contrast, when one primarily perceives that *A* is *F*, one does so at least partly by means of perceiving *A*; moreover, one must perceive of *A* that it is *A* and *F*. This condition is met in all cases of perceiving that *A* is *F* - whether primarily or secondarily - partly by perceiving *A*. If one sees the car is touching the kerb (in part) by seeing the car, then one sees of it that it is a car and touching the kerb.

3 Primary perceiving-that and sense experience

A related distinction can be drawn between primary and secondary appears-as-if states. Some *A primarily appears* to one as if it is *A* and *F* if and only if it appears to one as if it is *A* and *F*, but not by appearing to one as if it is *B* and *G*, for any *B* distinct from *A* or any *F* distinct from *G*. *A* secondarily appears to one as if it is *A* and *F* if and only if it appears to one as if it is *A* and *F*, but not in a primary way. When one secondarily perceives that *A* is *F* partly by means of *A*'s appearing to one as if it is *A* and *F*, *A* secondarily appears to one as if it is *A* and *F*. When one primarily perceives that *A* is *F*, *A* primarily appears to one as if it is *A* and *F*. Thus, if one primarily hears that a sound is coming from the left, then a sound coming from the left sounds to one as if it is a sound and coming from the left.

G.N. Vesey (1971) labels appears-as-if states 'epistemic appearances'. Like beliefs, such states have propositional contents and involve the exercise of concepts. However, as Frank Jackson (1977) argues, they are not beliefs or even inclinations to believe. One Müller-Lyer arrow may visually look to me as if it is longer than the other without my believing the one is longer than the other, or even being inclined to so believe. Familiar with the illusion, I may be certain they are of the same length.

Roderick Chisholm (1957) labels the use of sensory-appearance words in such locutions as '*A* appears (looks/sounds, and so on) as if it is *F* and 'It appears as if *A* is *F* their 'epistemic use'. He has distinguished such uses from their phenomenal use, their use in locutions of the form '*A* appears to *S*', where what fills in the blank are terms for sensory properties - properties such as redness, squareness, loudness, saltiness, putridness, and the like - or terms for properties wholly composed of sensory properties. (He also distinguishes their use in locutions such as '*A* looks like an *F* to *S*', labelling it the 'comparative use'.) The phenomenal use of an appearance verb is not equivalent to its epistemic use or any restricted range of its epistemic use. For while *A* cannot appear to one as if it is *F* unless one has the concept of *F*, *A* can phenomenally appear *F* to one without one's having the concept.

When A primarily appears to one as if it is *A* and *F*, *A* phenomenally appears *F* to one. Thus, one is in an epistemic appearance state only if one is undergoing a sense experience. But how else, exactly, epistemic appearances relate to sense experiences is an empirical question that bears on such issues as the functional architecture of our minds, and whether naturalistic accounts of intentionality and sensory consciousness are possible - issues that go to the heart of the mind-body problem. On one currently leading proposal - developed by Dretske, Alvin Goldman, Christopher Peacocke and others - which promises to integrate with current information-processing psychological models of percepts and concepts, sense experiences have a kind of non-conceptual representational content, and states such as epistemic appearances conceptually utilize aspects of their contents. On this picture, sense experiences by which we perceive (rather than hallucinate) discriminate certain sorts of environmental states of affairs within the range of our sense organs. We acquire perceptual recognitional concepts - either through a combination of our genetic endowment and normal processes of maturation or through perception-based learning - and in the process come to undergo epistemic appearances that discriminate states of affairs partly by means of their discrimination by our sense experiences. In acquiring perceptual recognitional abilities, we thus build on our endowed perceptual discriminative capacities in a way that enables us to acquire knowledge about things we perceive from how they phenomenally appear to us.

4 Perceiving-that and the interaction of beliefs

When one perceives that *A* is *F* by perceiving that *B* is *G*, one believes that *A* is *F*, believes that *B* is *G*, and the first belief state is based, in part, on the second. The basing relation involves causal dependence: the basing belief must contribute to causing the other belief or, if the believer already possesses that belief, to causally sustaining it.

Secondary perceiving-that does not require that the perceiver should consciously infer that *A* is *F* from the fact that *B* is *G*. Such conscious inferences are atypical - people in the process of acquiring perceptual recognitional abilities by learning make them (think of learning to read) - but once the abilities are fully acquired, the belief that *A* is *F* is typically formed without the mediation of conscious inference. Indeed, one can see that *A* is *F* by seeing that *B* is *G* without either consciously thinking that *A* is *F* or that *B* is *G*. Such conscious thought episodes are usually absent in cases of perceiving-that.

As Dretske (1995) notes, to perceive that *A* is *F* by perceiving that *B* is *G*, *B*'s being *G* must indicate, in the circumstances in question, that *A* is *F*. The one must indicate the other in the way in which, in certain circumstances, that there is smoke indicates that there is fire. The nature of indication remains a topic of discussion. But on one view if, in certain circumstances *C*, *Q* indicates that *P*, then, it is at least highly probable that if *C* and *Q*, then *P*.

Philosophers are divided over whether in cases of secondary perceiving-that, one must know that *B*'s being *G* indicates (in the circumstances) that *A* is *F*; and even over whether one must be justified in believing that, that is, believe it for reasons that would justify one in believing it. Proponents of strong internalism maintain that in cases of secondarily perceiving that *A* is *F*, one's reasons for believing that *A* is *F* must include that *B*'s now being *G* indicates that *A* is *F*, and that this must itself be held for reasons that suffice for one to know it. Proponents of weak internalism require only that it be held for reasons that suffice for one to be justified in believing it. Proponents of externalism maintain that even the requirement that the perceiver should be justified in believing the relevant indication relation holds grossly over-intellectualizes perceptual knowledge. Externalists charge that internalists conflate the issue of whether people know with whether they know that they do, and/or whether they are justified in believing or claiming that they do. Beliefs that count as perceptual knowledge, they maintain, are warranted by the reliability of their source. Internalists counter that this unacceptably makes perceptual knowledge a matter of luck (see Internalism and externalism in epistemology).

Nevertheless, to perceive that *A* is *F* by perceiving that *B* is *G*, the perceiver must regard *B*'s being *G* as indicating, in the circumstances, that *A* is *F*. That *B*'s being *G* so indicates that *A* is *F* is a theoretical hypothesis about the relationship between *B*'s being *G* and *A*'s being *F*. Since secondary perceiving-that requires a background belief in such a hypothesis, secondary perceiving-that is theory-ladened.

Natural indication plays a role in primary perceiving-that as well. To primarily perceive that *A* is *F*, its basically appearing to one as if *A* is *F* must indicate, in the circumstances, that *A* is *F*. It is controversial, however, whether to primarily perceive that *A* is *F*, one must believe that its appearing to one as if *A* is *F* indicates, in the circumstances, that *A* is *F*. Internalists maintain that such a belief is required and must be at least justified. Externalists typically deny that even such a belief is required; the requirement, they maintain, over-intellectualizes primary perceiving-that. If such a belief is required, perceivers who lack beliefs about how things appear to them could not be perceivers-that. Thus, animals and very young children (who lack the concept of experience) would never perceive that anything is the case. (That is not to deny they ever perceive anything. Perceiving things does not require perceiving-that.)

Even if there is no such belief requirement on primary perceiving-that, primary perceiving-that is, nevertheless, in a sense, theory-ladened: it is dependent on background beliefs. Whether one would, in any situation, believe that *A* is *F* will depend, at least to some extent, on what else one would believe in that situation. As Wilfred Sellars (1968) argues, every mode of belief-acquisition involves, to some extent, the interaction of beliefs (see Sellars, W. §3).

5 Perceptual knowledge is fallible

Proponents of sense-data theory maintain that when *A* is a kind of sense datum, and *F* is a sensory property, its

primarily appearing to one as if *A* is *F* provides one with conclusive reason to believe that *A* is *F*. Sense data cannot be hallucinated, and cannot appear to have sensory properties they lack. Thus, in such cases, if it primarily appears to one as if *A* is *F*, then *A* is *F*. There is no appearance-reality gap here. Sense data are essential components of sense experiences; the way they appear is an aspect of the experience itself. To have a colour-experience, for instance, is just to immediately see or visually sense a coloured visual sense datum. (This is an act-object theory of sense experience.) Sense data are, on these grounds, claimed to be essentially private: only you can perceive yours and only I can perceive mine.

Some sense-data theorists defend an empiricist thesis according to which such primary epistemic appearance states provide an infallible foundation for all empirical knowledge (see Foundationalism §1; Empiricism §4). Introspection affords an infallible way of knowing whether it primarily looks to one as if *A* is *F* (see Introspection §§1-3). One can know a priori that if it primarily looks to one as if *A* is *F*, then *A* is *F*. So, relying only on introspection and a priori reasoning, one can know both what it is that primarily appears to one to be the case, and that it is the case. Such theorists acknowledge that on this indirect realist view, there is a logical gap between states of one’s sense data having sensory qualities and extra-experiential states of affairs involving material objects and physical events. In response to the charge that their view renders the physical world itself unknowable - hidden behind a veil of sensory appearance - they hold that beliefs about such extra-experiential matters can be arrived at by theorizing about the causal factors responsible for our perceiving sense data.

There are two main lines of argument for the existence of sense data. One is the argument from illusion, demonstrated as follows:

(P1) If something looks *F* to one, then one sees something *F*
(P2) In cases of illusion, something looks *F*, but nothing physical that one sees is *F*
(C) Therefore, in cases of illusion, one sees something nonphysical

The argument is standardly supplemented by an appeal to a continuity-of-experience principle to the effect that since our non-illusory experiences are phenomenologically like our illusory ones, if we see nonphysical things when undergoing illusory experiences, we do so also when undergoing non-illusory ones. This principle has been plausibly challenged by J.L. Austin (1962) (see Austin, J.L. §2). But to focus on the argument from illusion itself, it is valid only if ‘see’ is used relationally throughout - used in such a way that if *S* sees *X*, then there is an *X* such that *S* sees it. For the phenomenal use of ‘see’ has no existential import. (A victim of delirium tremens may phenomenally see a pink elephant, even though there is no pink elephant that they see.) If ‘see’ is used phenomenally in (P1), the premise is unobjectionable; but the argument is invalid. However, if ‘see’ is used relationally, then (P1) renders the argument question-begging.

The second line of defence is that nothing physical could be a primary bearer of sensory properties. No compelling case for this has been made, however. According to secondary-quality views of sensory properties, they are dispositions to appear phenomenally in certain ways; for example, redness is the disposition to look red. According to primary-quality views, sensory properties are experience-independent properties; on one version, they are the physical bases for dispositions to appear phenomenally in certain ways; so, for instance, the basis for a physical surface’s disposition to look red might be its having a certain sort of disposition to affect light (for example, a certain sort of spectral reflectance distribution). Both sorts of theories admit of many non-equivalent versions (see Secondary qualities §1; Colour, theories of §3). A secondary-quality theory need not apply that there are sense data. And if any primary-quality theory of sensory properties is correct, then the second line of defence of sense data fails.

The first and foremost problem with sense-data theory is that there is no good reason to believe that there are any sense data, and compelling reason to believe there are none. Philosophers in the Wittgensteinian tradition have challenged the very coherence of the notion of an essentially private entity. (Some of the literature on Wittgenstein’s argument against the possibility of an essentially private language bears on this.) But even if the notion is coherent, the problems for sense-data theory remain legion. Sense data are wholly immaterial. So, unless physics cannot be trusted, they lack causal powers. How, then, do sense experiences influence epistemic appearances? If sense experiences are partly constitutive of epistemic appearances rather than causes of them, such aspects of epistemic appearances could exert no causal influence on beliefs. How, then, could we form beliefs about our sense data?

Intuitive support for sense-data theory comes from the fact that we speak of seeing such things as red after-images. When we see a red after-image, there is nothing physical that we see that is red. But in these cases we see something red only in the phenomenal sense, not in the relational sense. Seeing a red after-image just consists in having a certain sort of visual experience - as of, say, a red circle - acquired in a certain way. Experiences are states or events, and thus are not themselves coloured. Moreover, while we relationally perceive by having sense experiences, we do not perceive sense experiences themselves.

Coloured areas, sounds, odours and tastes, which are among the usual candidates for sense data, arguably meet some of the conditions which sense-data theorists maintain they meet. For example, they play a primary role in perceiving material objects. We can say that a subject basically perceives *A* by undergoing a sense experience *E* if and only if the subject perceives *A* by undergoing *E*, but not by perceiving something else *B* by undergoing *E*. Arguably, sounds are basically heard, odours basically smelled, tastes basically tasted; and, if ‘colour’ is used in an extended sense to include brightness properties (for example, glaring, glowing and so on) as well as chromatic colours (red, green and so on) and achromatic colours (white, black, and shades of grey), what are basically seen are coloured surfaces and volumes.

As David Sanford (1976) and others argue, coloured surfaces and the rest are, however, not sense data. They are publicly observable: you and I can both see the brown surface of the table top, hear the loud sound of the gunshot, or smell the putrid odour of the cheese behind the refrigerator. The brown volume of the Coca-Cola can be photographed; sounds can be recorded. Sounds and odours travel in physical space: objects emit, produce or give off sounds and odours. On a direct realist view, coloured surfaces and the rest are not constituents of sense experiences; rather, they are in physical space before our sense organs and among the causes of our sense experiences.

Coloured surfaces and the rest are, moreover, arguably the primary bearer of sensory properties. A material object is loud only if the sound of it is loud, putrid only if the odour of it is putrid, red only if some surface or volume of it is red. On a secondary-quality theory, they are the primary bearers of the relevant dispositions; on a primary-quality theory, they possess physical bases for the dispositions.

The thesis that coloured surfaces and the rest are basically perceived and primary bearers of sensory properties offers no support to infallible foundationalism. We can have illusory experiences of them and even hallucinate them. A sufferer of delirium tremens might hallucinate the pink surface of an elephant, a sufferer of command-hallucinations the sound of a voice issuing commands. According to intentional theories of sense experience, the first has a visual experience as of a pink surface, the second an auditory experience as of sounds. These experiences have contents. But nothing pink is seen; no sound is heard.

Perfectionism

Perfectionism is a moral theory according to which certain states or activities of human beings, such as knowledge, achievement and artistic creation, are good apart from any pleasure or happiness they bring, and what is morally right is what most promotes these human 'excellences' or 'perfections'. Some versions of perfectionism hold that the good consists, at bottom, in the development of properties central to human nature, so that if knowledge and achievement are good, it is because they realize aspects of human nature. With or without this view, perfectionisms can differ about what in particular is good, for example, about the relative merits of knowing and doing. The most plausible versions of perfectionism affirm both self-regarding duties to seek the excellences in one's own life and other-regarding duties to promote them in other people. Some critics argue that the latter duties, when applied to political questions, are hostile to liberty and equality, but certain versions of perfectionism endorse liberty and equality. Perfectionist ideas can also figure in a pluralist morality where they are weighed against other, competing moral ideas.

1 Broad versus narrow perfectionism

Despite being ignored by English-speaking philosophers for much of the twentieth century, perfectionism is one of the leading moralities of the Western tradition. It is wholly or in part the morality of, among others, Plato, Aristotle, Aquinas, Leibniz, Hegel, Marx, Nietzsche, Brentano, T.H. Green, F.H. Bradley, G.E. Moore and W.D. Ross.

Defined broadly, perfectionism is a teleological morality with an objective theory of the human good (see Good, theories of the; Teleogical ethics; Welfare). As a teleological morality, it is centred on claims about the good and characterizes right action in terms of the good, for example, as that which will result in the most good possible (see Right and good). Its structure, therefore, is similar to that of utilitarianism (see Utilitarianism). But whereas utilitarians traditionally characterize the good subjectively, as consisting in pleasure, the fulfilment of desires, or 'happiness', perfectionists value states or activities of humans other than happiness (see Happiness; Hedonism). They hold that, for example, knowledge, achievement, and aesthetic appreciation are good apart from any pleasure or satisfaction they bring. Their presence in a life makes that life better independently of how much they are wanted or enjoyed, and their absence impoverishes it even if it is not a source of regret.

Defined more narrowly, perfectionism is based on an objective theory of a special kind. It holds that the good consists at bottom in developing one's 'nature', or realizing a 'true self' (see Human nature §1): certain properties are central to one's identity, and one's good consists in developing these properties to a high degree. In some versions of this narrower perfectionism the relevant identity belongs to one as an individual, but more commonly it is shared with all human beings, so that, for example, the properties distinctive of or essential to humans determine the human good. If knowledge and achievement are good, on this view, it is because they realize aspects of human nature.

Narrow perfectionism has often been accompanied by dubious non-moral views, for example, that developing human nature is each human's 'function' or purpose, or that premises about human nature entail conclusions about the good. But it is best considered apart from these views, as making only the moral claim that a being's good is determined by its nature. If this claim can be sustained, narrow perfectionism has two attractive features. Its central ideal of developing human nature is intuitively appealing in itself, or at least has been found so by philosophers from Aristotle to Marx and Nietzsche. And this ideal offers to unify what might otherwise be an unordered list of objective goods. But narrow perfectionism faces serious objections. It must provide a more precise definition of human nature that both retains the intrinsic appeal of the narrow ideal and includes only properties that in themselves seem worth developing. This dual test is not passed by the commonest definitions of human nature, since humans have both distinctive properties (such as killing things for fun) and essential properties (such as occupying space) that do not seem morally valuable. Indeed, many contemporary philosophers doubt whether, especially given the findings of evolutionary biology, any true theory of human nature can ground plausible claims about value (see Evolution and ethics). If they are right, narrow perfectionism is no longer a viable option. The most plausible morality of this kind is not a narrow but a merely broad perfectionism, one that makes objective claims about the good without grounding them in human nature.

2 Theoretical and practical perfections

Different versions of perfectionism can differ in their particular claims about the good. (Among narrow perfectionisms, these differences rest on deeper disagreements about human nature.) Some perfectionists, notably Plato, Aristotle and Aquinas, take the highest human good to be the development of theoretical reason, found especially in the contemplation of knowledge. Others value most, or only certain, practical excellences of acting on the world. Marx equates the human good with productive labour, especially in cooperation with others, while Nietzsche values large-scale, world-transforming creativity. A third view, found in Bradley, values theoretical and practical perfections equally and characterizes them in parallel ways. On this view the best knowledge is explanatorily integrated, with general principles explaining more particular known truths. The greatest practical goods involve a similar integration, with many subordinate ends achieved as means to a single overarching end. This grants perfectionist value to any life that is highly unified, and to particular activities that are complex and difficult.

More specific perfectionist claims find intrinsic goodness in political activity, either by government leaders or democratic participants; in love, friendship and other interpersonal relations; and in the creation or appreciation of artistic beauty. There can also be intrinsic perfectionist evils, such as false belief and failure. A more difficult question is whether moral virtue should be a perfectionist good and vice a perfectionist evil. This connects to the larger issue of how perfectionism accounts for other-regarding duties.

3 Perfectionism and other-regarding duties

Perfectionism gives a central place to self-regarding duties. Whereas some philosophers confine moral evaluation to acts that affect other people, perfectionists affirm moral duties to seek goods such as knowledge and achievement in one’s own life. To be a complete morality, however, perfectionism must also capture other-regarding duties such as the duties not to kill, to relieve starvation, and so on.

Some perfectionists attempt this within a formal structure that is egoistic, so each human’s ultimate duty is only to seek their own perfection. They do so by claiming that virtuous action, including the exercise of other-regarding virtues such as justice and beneficence, is part of the agent’s good (see Egoism and altruism §4; Virtue ethics; Virtues and vices §3). But this egoistic account of other-regarding duties is problematic. In a merely broad perfectionism, one can simply add virtue to a list of objective goods. But especially if virtue is given special weight against other goods, it is hard to see how the resulting morality differs significantly from a non-perfectionist one that simply tells agents to act justly and beneficently without tying this to claims about their good. Some egoistic perfectionists try to derive the goodness of virtue within narrow perfectionism. Thus, some argue that human nature consists in rationality, and that exercising rationality requires acting virtuously. But if there is a sense of rationality in which rationality is plausibly part of human nature, for example, is plausibly essential to humans, this rationality does not seem specially tied to virtuous action. It can be exercised not only in just and beneficent acts but equally in ones that ignore others’ needs (such as philosophizing while others starve) or positively hurt them.

A more promising approach is to give perfectionism a universalistic structure, so each human’s ultimate duty is to promote the greatest perfection of all, with others’ good counting as much as one’s own (see Universalism in ethics). This yields other-regarding duties, though on a distinctive basis: the reason we ought to relieve starvation and not kill is to promote others’ excellence. And, given a universalistic structure, perfectionism can go on to treat virtue as good. It can hold, as Brentano, Moore and Ross have done, that whenever something is good, loving it for itself, that is, desiring, pursuing, or taking pleasure in it for itself, is also good. Then desiring and pursuing the objective good of others, which for perfectionists constitutes virtue, is itself an objective good. This account of virtue is an attractive addition to broad perfectionism, but it presupposes that each agent should already care about the perfection of all. Given a structure that already grounds other-regarding duties, perfectionism can add that fulfilling these duties virtuously promotes one aspect of the agent’s good. It is harder for it, while remaining distinctively perfectionist, to derive other-regarding duties from a concern only with the agent’s perfection.

4 Perfectionism and politics

Applied to political questions, perfectionism uses the same teleological standard as for evaluating acts by individuals: the best government, leader or law is the one that most promotes perfection. Though this is a classical

view of politics, some critics worry that it threatens the values of liberty and equality (see Equality; Freedom and liberty). Will a state committed to objective goods not force citizens into activities it deems valuable, thereby violating individual liberty? Instead of distributing resources equally, will it not concentrate them on a small elite with the greatest talents for excellence? Some perfectionisms, for example, those of Plato, Aristotle and Nietzsche, substantiate these worries, but others, notably Marx's and Green's, endorse liberty and equality. They do so because of specific features of their structure and theories of value.

Perfectionism can most simply value liberty by making the free choice of one's life-activities itself an objective good (see Autonomy, ethical). This perfectionist valuing of choice lies behind the classical liberalisms of Wilhelm von Humboldt and J.S. Mill. In addition, perfectionism can hold, as Green did, that the value of any activity depends crucially on the attitude with which it is done, and that state coercion not only cannot produce good attitudes but is likely to discourage them. These arguments leave room for non-coercive state action to promote perfection, such as subsidizing good activities or in other ways encouraging them.

Some perfectionisms are anti-egalitarian because of their structure. Thus, Nietzsche makes the goal of individual and state action the greatest perfection, not of all, but of the few best individuals. The most attractive perfectionisms, however, give equal weight to gains in perfection by all people. And they will support roughly equal distributions of resources if they can make the following empirical claims: that people's overall talents for perfection do not differ immensely, and that many highly valuable perfections require only modest resources. Some theories of the good, such as Plato's and Aristotle's, make these empirical claims unlikely, but others, such as Green's, support them. If perfection is largely a matter of people's attitudes, then many inexpensive activities can have value, and each person has many chances to have some worthwhile talent. There is further support for equality if the perfections of different people enhance each other. If each person's development requires a similar development for others, as Marx held, then all will do best in a society where all have the resources for excellence. In short, though some versions of perfectionism do deny liberty and equality, others, arguably the most plausible, endorse them.

5 Perfectionism in pluralism

Perfectionist ideas can figure not only in a pure morality but also in a pluralist one where they are weighed against competing ideas about, for example, utility or rights (see Moral pluralism). One possibility is a teleological pluralism with a duty to promote not only perfectionist goods but also utilitarian ones such as pleasure. J.S. Mill's theory, with its distinction between higher and lower pleasures, fits this mixed teleological pattern (see Mill, J.S. §9). Another pluralist morality combines a teleological duty to promote what is good with non-teleological duties about killing, truth-telling and the like, as Ross's theory does. In these pluralist contexts perfectionist ideas make a distinctive contribution, grounding both self-regarding and other-regarding duties to pursue objective goods such as knowledge and achievement. The central perfectionist thought is that these states are good independently of any connection with happiness and that a prime moral duty is to promote them in oneself and in others.

Performatives

There are certain things one can do just by saying what one is doing. This is possible if one uses a verb that names the very sort of act one is performing. Thus one can thank someone by saying 'Thank you', fire someone by saying 'You're fired' and apologize by saying 'I apologize'. These are examples of 'explicit performative utterances', statements in form but not in fact. Or so thought their discoverer, J.L. Austin, who contrasted them with 'constatives'. Their distinctive self-referential character might suggest that their force requires special explanation, but it is arguable that performativity can be explained by the general theory of speech acts.

In *How to Do Things with Words* (1962), J.L. Austin challenges the common philosophical assumption that indicative sentences are necessarily devices for making statements. Just as nonindicative sentences are marked grammatically for nonassertive use (interrogative sentences for asking questions and imperative sentences for requesting or ordering), certain *indicative* sentences are also so marked. Austin's paradigm is any sentence beginning with 'I' followed by an illocutionary verb (see Speech acts §1), such as 'promise', 'apologize' or 'request', in the simple present tense and active voice. One can make a promise by uttering the words 'I promise to go', but not by uttering 'I promised to go' or 'She promises to go'. The first-person plural can be performative too, as in 'We apologize… ', and so can the second-person passive, as in 'You're fired'. The word 'hereby' may be used before the performative verb to indicate that the utterance in which it occurs is the vehicle of the performance of the act in question.

Austin contended that these 'explicit performative utterances' are, unlike 'constatives' (statements, predictions, hypotheses, and so on), neither true nor false. In saying 'I promise to go' one is making a promise, not stating that one is making it. A performative promise is not, and does not involve, the statement that one is promising. It is an act of a distinctive sort, the very sort (promising) named by the performative verb. And, according to Austin, making explicit what one is doing is not describing what one is doing or stating that one is doing it.

Now it is also possible to promise without doing so explicitly, without using the performative verb, and this raises the question of whether there is a theoretically important difference between promising explicitly and doing it inexplicitly. A superficial difference is that in uttering the words 'I promise to go' the speaker is saying that he is promising to go and that this, what he is saying, is assessable as true or false. It is true just in case he is doing what he says he is doing - that is, promising to go. In general, in making an explicit performative utterance the speaker is saying what he is doing - and is thereby doing it. Does this mean that performativity requires a theoretically special explanation?

One suggestion is that performativity is a matter of linguistic meaning. Perhaps there is a special semantic property of performativity, so that it is part of the meaning of words like 'promise', 'apologize' and 'request' that one can perform an act of that very sort by uttering a performative sentence containing that verb. One problem with this suggestion is that it implausibly entails that such verbs are systematically ambiguous. For a performative sentence can be used literally but nonperformatively - for example, to report some habitual act. For instance, one might say 'I apologize… ' to describe typical situations in which one apologizes. Moreover, it seems that even if verbs like 'promise', 'apologize' and 'request' were never used performatively, they would still mean just what they mean in fact. Imagine a community of users of a language just like English in which there is no practice of using such verbs performatively. When people there perform acts of the relevant sorts, they always do so, just as we sometimes do, without using performative verbs, such as making promises by saying 'I will definitely… ', giving apologies by saying 'I'm sorry', and issuing requests by using imperative sentences. In this hypothetical community the verbs 'promise', 'apologize' and 'request' would seem to have the same meanings that they in fact have in English, applying, respectively, to acts of promising, apologizing and requesting. The only relevant difference would be that such acts are not performed by means of the performative form. It seems, then, that in our community, where they are sometimes performed in this way, performativity is not a matter of meaning.

It might be suggested that a special sort of convention is required for uses of the performative form to count as promises, apologies, requests, and so on. Explaining this by appealing to convention is gratuitous, however, for performativity is but a special case of a more general phenomenon. There are all sorts of other forms of words which are standardly used to perform speech acts of types not predictable from their semantic content, such as 'It

would be nice if you… ' to request, 'Why don't you… ?' to advise, 'Do you know… ?' to ask for information, 'I'm sorry' to apologize, and 'I wouldn't do that' to warn. In particular, there are hedged and embedded performatives, such as 'I can assure you… ', 'I must inform you… ', 'I would like to invite you… ', and 'I am pleased to be able to offer you… ', utterances to which the alleged conventions for simple performative forms could not apply. Could such conventions be suitably generalized? The variety of linguistic forms standardly used for the indirect performance of such speech acts seems too open-ended to be explained by any convention (or set of conventions) that is supposed to specify just those linguistic forms whose utterance counts as the performance of an act of the relevant sort.

An alternative explanation is needed. In general, speech acts are acts of communication, whose success in that regard requires the audience to identify the speaker's intention (see Speech acts §2). As Bach and Harnish (1979) have argued, what is special about the use of standardized forms of words, such as those illustrated above, is not that they provide the precedent for any conventions. Rather, the precedent provided by standardization serves to streamline the inference required on the part of the audience.

Convention seems relevant to performativity only in certain institutional contexts, where a specific form of words is designated, and often required, for the performance of an act of a certain sort. This is true of those performative utterances involved in, for example, adjourning a meeting, sentencing a criminal, or christening a ship. However, ordinary performative utterances are not bound to particular institutional situations. Like most speech acts, they are acts of communication and succeed not by conformity to convention but by recognition of intention (see Communication and intention).

Peripatetics

The title 'Peripatetics' designates followers of the philosophical tradition founded by Aristotle: at first those who continued his inquiries, and in the Roman period those who interpreted and commented on his writings. The distinctive Peripatetic tradition was eventually absorbed into Neoplatonism. The adjective 'Peripatetic' is often used as an equivalent of 'Aristotelian'. Peripatetic doctrines were marked by a rejection of the extreme views characteristic of Stoicism.

'Peripatetic' was the name applied to the Aristotelian tradition in philosophy, the name allegedly deriving from a habit of walking about (*peripatein*) while teaching but more probably from teaching in a colonnade or *peripatos*. The independent history of the tradition in antiquity falls into three principal phases. In the sixty years after the death of Aristotle in 322 BC, his followers, and especially the heads of the school (see Theophrastus; Strato), continued his philosophical and scientific inquiries into a wide variety of topics. The school was not concerned to recommend a way of life - or perhaps saw the pursuit of disinterested theoretical inquiry as itself a way of life. Its failure to provide the moral guidance that other contemporary schools were offering (see Epicureanism; Hellenistic philosophy; Stoicism) may have contributed to its subsequent decline; and from the middle of the third to the middle of the first century BC there were few Peripatetics of importance - Critolaus, who accompanied Carneades §1 on the embassy to Rome in 155 BC, is the chief exception - and interest in Aristotle took the form of summary accounts of his doctrines (like that preserved for us by Diogenes Laertius), often reflecting later preoccupations.

This type of interest was continued, but on a more informed basis, by scholars such as Arius Didymus and Nicolaus of Damascus after the event which is commonly thought to have begun the third phase of the Peripatetic tradition, Andronicus of Rhodes' revival, in the mid-first century BC, of direct study of the 'esoteric' or previously unpublished treatises which we possess today. We need not believe the story, in Plutarch and Strabo, that these texts had been hidden in a cellar in Asia Minor until the first century BC. But with Andronicus there began a sequence of commentaries which extended from Andronicus himself to the end of a distinctive Peripatetic tradition and even beyond. There was a corresponding decline of interest in the 'exoteric' or published works, now lost to us.

The commentators concentrated on the aspects of Aristotle's treatises which are 'philosophical' in a modern sense, neglecting the biological, rhetorical and political writings. Important figures were Andronicus' pupil Boethus, Aspasius, whose commentary on the *Nicomachean Ethics* is the earliest of the commentaries we possess except through later reports, and above all, Alexander of Aphrodisias. The commentators sought to reconcile discrepancies between different Aristotelian texts and thus furthered the construction of Aristotelianism as a distinctive system of doctrine. After Alexander those who undertook the study of Aristotelian texts and produced commentaries on them were, with the exception of Themistius, Neoplatonists who regarded Aristotle's philosophy as an introduction to that of Plato (see Aristotle Commentators; Neoplatonism §2).

In philosophical doctrine the distinctive feature of the Peripatetic tradition is moderation. In metaphysics members of the school advocated a this-worldly realism which rejected both Platonic transcendent Forms and Stoic nominalism. In physics and theology a recurring theme is that the universe - regarded with Aristotle as everlasting - is a system in which the same degree of organization cannot be expected at every level. In ethics, although individual formulations varied, Peripatetics followed Aristotle himself both in advocating moderation with regard to the emotions (*metriopatheia*) rather than the Stoic rejection of them (*apatheia*), and in regarding external goods as having some influence on human happiness even though virtue itself was much more important.

Personal identity

What is it to be the same person today as one was in the past, or will be in the future? How are we to describe cases in which (as we might put it) one person becomes two? What, if anything, do the answers to such questions show about the rationality of the importance we attach to personal identity? Is identity really the justifier of the special concern which we have for ourselves in the future? These are the concerns of this entry.

In order to answer the question about the persistence-conditions of persons we must indulge in some thought experiments. Only thus can we tease apart the strands that compose our concept of personal identity, and thereby come to appreciate the relative importance of each strand. There are plausible arguments against attempts to see the relation of personal identity as constitutively determined by the physical relations of same body, or same brain. I can survive with a new body, and a new brain. But it does not follow; nor is it true, that a person's identity over time can be analysed exclusively in terms of psychological relations (relations of memory, belief, character, and so on). To the contrary, the most plausible view appears to be a mixed view, according to which personal identity has to be understood in terms of both physical and psychological relations. This is the view which can be extracted from our core (that is, minimally controversial) set of common-sense beliefs about personal identity.

The possibility of the fission of persons- the possibility that, for example, a person's brain hemispheres might be divided and transplanted into two new bodies - shows that the mixed view has to incorporate a non-branching or uniqueness clause in its analysis. The concept of personal identity, contrary to what we might first be inclined to believe, is an extrinsic concept (that is, whether a given person exists can depend upon the existence of another, causally unrelated, person).

Some philosophers have recently tried to forge an important connection between theories of personal identity and value theory (ethics and rationality). The possibility of such a connection had not previously been investigated in any detail. It has been argued that, on the correct theory of personal identity, it is not identity that matters but the preservation of psychological relations such as memory and character. These relations can hold between one earlier person and two or more later persons. They can also hold to varying degrees (for example, I can acquire a more or less different character over a period of years). This view of what matters has implications for certain theories of punishment. A now reformed criminal may deserve less or no punishment for the crimes of their earlier criminal self. Discussions of personal identity have also provided a new perspective on the debate between utilitarianism and its critics.

1 Criteria of personal identity

What is it to be a person? What is it for a person at one time to be identical to some person at a later time? Although the two questions are obviously related, my concern in this entry will be with the second question. (For more on the first question, see Persons; Mind, bundle theory of.) However, I assume this much about what it is to be a person: a person is a rational and self-conscious being, with a (more or less) unified mental life. There are indeed cases (multiple personality, split-brain patients, and so on) in which the apparent lack of mental unity casts doubt on whether a single person occupies a given body (see Split brains). But such cases are exceptional. A normal person is a mentally unified individual. The central question of personal identity is the question of what distinguishes the sorts of changes we mentally unified individuals can survive from the sorts of changes which constitute our death.

On one very familiar view (associated with Plato, Descartes and the Christian tradition) a person can survive bodily death. Bodily death is not the sort of change which constitutes personal death. On this view, a person is an immaterial (that is, non-spatial) soul, only contingently attached to a physical body (see Soul, nature and immortality of the; Soul in Islamic philosophy). This view has few philosophical adherents today. It is fraught with metaphysical and epistemological difficulties. (For example: how can an immaterial soul interact with the material world? How can I know that you have a soul?) In what follows I simply assume, without further argument, that our continued existence is not the continued existence of an immaterial soul.

I do not have to deny that in some possible worlds, there are persons who are immaterial souls; but ours is not such a world. And our concern here is with the conditions for the identity over time of actual (human) persons. Once we

have given up the immaterialist view of ourselves, we can say the following. A person is a psychophysical entity, which is essentially physically embodied. That is a person (a typical adult human, for example) consists of a biological organism (a human body), with a control centre (the brain) that supports their mental life. Persons are essentially mental, and essentially physically embodied. But this is not the end of puzzles about personal identity; it is just the beginning.

When we judge that a friend before us now is identical to the friend we saw yesterday, we typically make this judgment of personal identity under optimal conditions. In such a case, our friend today is physically continuous with our friend yesterday (they possess the very same brain and body). And our friend today is also psychologically continuous with our friend yesterday (they possess the very same beliefs, character, desires, memories, and so on, with only very slight changes). In this case, our identity judgment is true in virtue of the obtaining of both physical and psychological continuities. The puzzle of personal identity is: which continuity (if any) is the more important or central to our concept of personal identity? Evidently, reflection on the paradigm case just described will not help us to answer that question. We need to consider thought experiments where the continuities come apart.

There are three broad accounts or criteria of personal identity over time: the physical criterion, the psychological criterion, and the mixed criterion. These criteria do not purport just to offer quite general ways of telling or of finding out who is who. They also purport to specify what the identity of persons over time consists in: what it is to be the same person over time. According to the physical criterion, the identity of a person over time consists in the obtaining of some relation of physical continuity (typically either bodily continuity or brain continuity). On this view, to be the same person is to be the same living biological object (whether body or brain).

According to the psychological criterion, the identity of a person over time consists in the obtaining of relations of psychological continuity (overlapping memory chains, or memory together with the retention of other psychological features such as well-entrenched beliefs, character, basic desires, and so on). The psychological criterion splits into a narrow version and a wide version. According to the narrow version, the cause of the psychological continuity must be normal (that is, the continued existence of one's brain) if it is to preserve personal identity; according to the wide version, any cause will suffice (normal or abnormal). (See Parfit 1984 ch. 10 for more on this distinction.) Sub-versions of the wide and narrow versions differ over the question of whether any one psychological relation is privileged with respect to identity preservation. (For example, John Locke thought that memory was such a privileged relation.)

Each of the physical and psychological criteria divides into many different versions. The distinctive claim of the mixed criterion is that no version of either the physical or psychological criterion is correct. The best account of a person's identity over time will make reference to both physical and psychological continuities.

I now want to examine in more detail different versions of the physical and psychological criteria. My conclusion will be that all familiar versions of these criteria are open to objection, and that we should accept the mixed criterion. The mixed criterion best captures our core (that is, minimally controversial) beliefs about personal identity.

We can begin with the physical criterion. As noted, this criterion divides into two criteria: the bodily criterion and the brain criterion.

2 Physical criteria

Physical criteria: the bodily criterion. According to the bodily criterion, person A at time t_1 is identical to person B at t_2 if and only if A and B have the same body (that is, they are bodily continuous). Note that A and B can truly be said to have the same body, even though the body at the later time has no matter in common with the body at the earlier time (see Continuants). In such a case, however, the replacement of matter must be gradual, and the new matter must be functionally absorbed into the living body. This is how it is in the life of a normal human being.

The bodily criterion accords with most of our ordinary judgments of personal identity. However, there appear to be logically possible cases in which the deliverances of the bodily criterion conflict with our considered judgments. The particular case I have in mind is that of brain transplantation. Such transplants are, of course, technologically impossible at present; but that is hardly relevant. The speculations of philosophers are not confined to what is

technologically possible.

Sydney Shoemaker was the first to introduce such cases into the philosophical literature. He wrote:

> It is now possible to transplant certain organs… it is at least conceivable…that a human body could continue to function normally if its brain were replaced by one taken from another human body.…Two men, a Mr. Brown and a Mr. Robinson, had been operated on for brain tumors, and brain extractions had been performed on both of them. At the end of the operations, however, the assistant inadvertently put Brown's brain in Robinson's head, and Robinson's brain in Brown's head. One of these men immediately dies, but the other, the one with Robinson's head and Brown's brain, eventually regains consciousness. Let us call the latter 'Brownson'.…When asked his name he automatically replies 'Brown'. He recognizes Brown's wife and family…, and is able to describe in detail events in Brown's life…of Robinson's life he evidences no knowledge at all.
>
> (Shoemaker 1963: 23-4)

We can suppose, in addition, that Brown and Robinson are physically very similar, and that their bodies are equally suited for the realization of particular dispositions or abilities (for example, playing the piano, or hang-gliding).

The description of this case which commands almost universal assent is that Brown is the same person as Brownson. Virtually no one thinks that the correct description is: Robinson acquires a new brain. Receiving a new skull and a new body seems to be just a limiting case of receiving a new heart, new lungs, new legs, and so on. If Brown is the same person as Brownson, and yet Brownson's body is not the same body as Brown's body, then it follows that the bodily criterion is false.

Physical criteria: the brain criterion. In the light of this example, it would be natural for a defender of the physical criterion to move to the brain criterion: A at t_1 is the same person as B at t_2 if and only if A and B possess the same brain. But is this a plausible criterion of personal identity? I think not. The following scenario is conceivable. Imagine that robotics and brain science have advanced to such a stage that it is possible to construct a silicon brain which supports the very same kind of mental life as that supported by a flesh-and-blood human brain. Imagine also that parts of a human brain (say, a cancerous part) can be replaced by silicon chips which subserve the very same mental functions as the damaged brain tissue.

Suppose that the whole of my brain gradually becomes cancerous. As soon as the surgeons detect a cancerous part, they replace it with silicon chips. My mental life continues as before - the same beliefs, memories, character, and so on, are preserved. Eventually, the surgeons replace all my biological brain with a silicon brain. Since my mental life, and physical appearance and abilities, are unaffected by this replacement, we have no hesitation in judging that I have survived the operation. The procedure preserves personal identity. But is this judgment of personal identity consistent with the brain criterion? The answer to this question depends on whether my (later) silicon brain is deemed to be identical to my (earlier) human brain.

It is plausible to suppose that, if an object (such as a heart, brain or liver) is biological, then that very object is essentially biological. That is, for example, my flesh-and-blood brain could not have been anything but a biological entity. This essentialist thesis is consistent with the view that the function of any given biological object (a human heart, for example) could, in principle, be carried out by a non-biological object (a mechanical pump, say). Hence, I am happy to concede that my later silicon brain is indeed a brain; but it is not remotely plausible to think that it is the same brain as my earlier human brain. Rather, the effect of all the tissue removals and bionic insertions in my skull is to destroy one brain and replace it with another.

Our brain example shows that the sort of matter or stuff with which we replace an object's removed parts can affect the overall identity of that object, even if continuity of form or function is preserved. My (earlier) human brain is not identical to my (later) silicon brain. Yet I survived the operation. Hence, the brain criterion is false.

However, there is a deeper worry about the tenability of the brain criterion. Why did we move to the brain criterion, in response to counterexamples to the bodily criterion? Was it because the human brain is a three-pound pinkish-grey spongy organ that occupies human skulls? No, we moved to the brain criterion because of what the human brain does, namely, supports directly our mental life. It is surely because of its mind-supporting function

that we are inclined to single out the brain as the seat of personal identity. Consequently, we should not see our identity over time as tied necessarily to the continued existence of the human brain we presently have. What matters most is that our stream of mental life continues to be supported by some physical object, not that it continues to be supported by the very same biological organ.

3 Psychological and mixed criteria

I take the bionic brain example to undermine not just the brain criterion, but also the narrow version of the psychological criterion - I survive with a bionic brain, yet the cause of my psychological continuity is abnormal. Hence, it might be thought, the combined effect of these conclusions is to push us towards the wide version of the psychological criterion. Indeed some readers may have wondered why I made no appeal in the first place to examples such as Bernard Williams's brain-state transfer device or Derek Parfit's teletransporter in order to establish the wide version of the psychological criterion.

What are these examples? First, Williams describes a device which can wipe a brain clean, while recording all the information stored in the brain. This machine can then reprogramme another clean brain. The machine can thus preserve psychological continuity in the absence of any physical continuity. Second, Parfit has made much use of the *Star Trek* fantasy of teletransportation. In this scenario, a physical and psychological blueprint is made of a person. The person is then painlessly destroyed. The blueprint is transmitted to another location where, out of different matter, an exact physical and psychological replica of the original person is made.

Some philosophers have claimed that, in both these examples, the original person is identical to the later person, and so concluded that physical continuity is not necessary for personal identity over time. Other philosophers have taken the opposite view, and concluded that physical continuity is necessary for personal identity over time. But these are judgments in which theory is being allowed to dictate intuitions. In truth, there simply is no general agreement about whether the original is the same person as the replica, in cases in which there is psychological continuity but no physical continuity.

Further, there appears to be a decisive objection to the wide version of the psychological criterion - the criterion which holds that personal identity over time consists in psychological continuity, however that continuity is caused. (A defender of the wide version would agree with my verdicts about the counterexamples to the body and brain criteria, and would also regard the normal operation of the brain-state transfer device and the teletransporter as identity-preserving.) Imagine that I step into the teletransporter booth. My psychophysical blueprint is constructed, and sent to another location, where a replica is created. Unfortunately, the machine malfunctions and fails to destroy me. I step out of the booth, intrinsically no different from when I went in. In this case, we have no hestitation in judging that I continue to exist in the same body, and therefore that the replica is not me. But both me-later and my replica stand to me-earlier in the relation of psychological continuity. If the cause of that continuity is deemed to be irrelevant to personal identity, as in the wide version of the psychological criterion, then it ought to be the case that both later candidates have an equal claim to be me. Yet, as we have seen, we strongly believe that I am identical to the later person who is physically and psychologically continuous with me. Consequently, the wide version of the psychological criterion cannot be correct.

I conclude that the best account of personal identity over time is provided by the mixed criterion. We have seen that neither continuity of body nor brain (nor, by extension, the continuity of any other human organ) is a necessary condition for personal identity over time. But we should not conclude from this that psychological continuity, whatever its cause, is sufficient for personal identity over time. As just noted, that thesis does not accord with our intuitions. The most consistent and plausible view that can be recovered from our core set of common-sense judgments appears to be the following: psychological continuity is necessary for personal identity over time; a sufficient condition of personal identity over time is not psychological continuity with any cause, but psychological continuity with a cause that is either normal or continuous with the normal cause (this is why I continue to exist with a bionic brain). One might well ask: why do we have just this concept of personal identity and not some other (such as the wide version of the psychological criterion)? Here, as with other conceptual analyses, there may be no non-trivial answer to this question.

Our discussion thus far has made a certain simplification. The counterexample to the wide version of the psychological criterion exploited the fact that relations of psychological continuity are not logically one-one. In

that example, one of the streams of psychological continuity did not have a normal cause. However, it is logically possible for a person at one time to be psychologically continuous with two or more later persons, even when both streams of psychological continuity have their normal cause (that is, the continued existence of the brain hemispheres). But the relation of identity is logically one-one: I cannot be identical to two distinct people. It seems, therefore, that the sufficient condition for personal identity endorsed in the previous paragraph will have to be modified, unless either such branching is impossible or the possibility of branching can be redescribed so that it does not conflict with our sufficient condition. The problem raised by the possibility of branching continuities is known as the problem of fission.

4 Fission of persons

As we have seen, much work in personal identity has made use of various thought experiments or imaginary scenarios. The method of thought experiments in personal identity has recently been subject to criticism. It has been claimed that we should not take our intuitions about thought experiments as guides to philosophical truth, since such intuitions may be prejudiced and unreliable. These criticisms are, I think, misplaced. For one thing, such criticisms ignore the frequent and legitimate use of thought experiments in virtually all traditional areas of philosophy (for example, in theories of knowledge and in ethics). Why is their use in discussions of personal identity singled out for criticism? Second, and more important, thought experiments can be useful in understanding the structure of a concept and the relative importance of its different strands, provided that there is general agreement about the best description of the thought-experiment. There is such general agreement about the counterexamples to the body and brain criteria. Some philosophers have tried to gain mileage from thought experiments in the absence of such general agreement - for example, the case of teletransportation discussed above. But it would be unwarranted to infer from the existence of such abuses that thought experiments can never perform any useful function in discussions of personal identity (see Thought experiments).

One thought experiment which has been much discussed in recent years, and which does not fall into the teletransporter category of thought experiments, is that of the fission or division of persons. This thought experiment is interesting because it shows us something about the nature or metaphysics of personal identity, about what it is to be the same person over time.

Fission is a situation in which one thing splits into two (or more) things. Fission does occur in nature (amoebae, for example). Fission of persons, of course, does not occur - but it might. We can devise a thought experiment to flesh out this possibility. Consider a person, Arnold. Like us, Arnold has a mental life that is crucially dependent upon the normal functioning of his brain. Arnold also has a property which most of us do not have, but might have done: each of his brain hemispheres support the very same mental functions. If one of Arnold’s hemispheres developed a tumour, that hemisphere could simply be removed and Arnold’s mental life would be unaffected.

Suppose that Arnold’s body develops cancer. The surgeons cannot save his body, but they can remove Arnold’s brain and transplant both hemispheres into two brainless bodies, cloned from Arnold’s body many years ago. Arnold agrees to this and the operation is successfully carried out. The fission of Arnold has taken place. We now have two people - call them Lefty and Righty - both of whom are psychologically continuous with Arnold (same character, beliefs, apparent memories of a common past, and so on). They are also physically similar to Arnold, and each contain a hemisphere from Arnold’s brain. There is both physical and psychological continuity linking Arnold with Lefty and with Righty. Suppose also that Lefty and Righty are in different rooms in the hospital, and exercise no causal influence on each other. How should this case be described - who is who? A number of responses have been suggested, which we shall examine in turn.

(1) ‘The case is not really possible, so we can say nothing about it and learn nothing from it.’ This view is implausible. Hemisphere transplants may be technologically impossible; but they are surely not logically impossible. Indeed, hemisphere transplants, like other organ transplants, appear to be nomologically possible (that is, consistent with the laws of nature). If so, such transplants are also logically possible. Response (1) is not a serious contender.

(2) ‘Arnold has survived the operation, and is one or the other of Lefty or Righty.’ Immediately after fission, Lefty and Righty are physically and psychologically indistinguishable. Both stand in the same psychological and physical relations to Arnold. They both believe that they are Arnold. According to response (2), one is right and

the other wrong.

Response (2) is implausible for two reasons. First, since Lefty and Righty are symmetrically related to Arnold in respect of physical and psychological continuities, the claim that, for example, Arnold is Lefty, can only be sustained on something like the Cartesian view of persons. If we think of the person as an immaterial ego that typically underlies streams of psychological life, we can suppose that Arnold's ego pops into the left-hand stream of consciousness, leaving the right-hand stream ego-less or with a new ego. As noted at the beginning of §1, this view of persons is bizarre. The postulation of such an ego is idle, and conflicts with both science and common sense.

Second, the metaphysical absurdity of the Cartesian view has an epistemic counterpart. According to response (2), when Arnold divides, he survives in one of the two streams. So either Arnold is Lefty or Arnold is Righty. But how can we know which? From the third-person point of view, we have no reason to make one identification rather than the other. Nor is appeal to the first-person perspective of any help: both Lefty and Righty take themselves to be Arnold. Nothing in either stream of consciousness will reveal to its bearer that it is Arnold. So if, for example, Arnold is Lefty, this truth will be absolutely unknowable. There may be no incoherence in the idea of unknowable truths, but we should be suspicious of any theory of personal identity which implies that truths about who is who can be, in principle, unknowable. For these reasons, we should reject response (2).

(3) 'Arnold survives fission as both Lefty and Righty.' There are three ways in which we can understand this response. According to the first way, Lefty and Righty are sub-personal components of a single person, Arnold. According to the second way, Arnold is identical to both Lefty and Righty (hence, Lefty is Righty). According to the third way, Lefty and Righty together compose Arnold (so that two persons are parts of one larger person, just as Scotland and England are parts of one larger country).

These views are hard to believe. It seems plain common sense that Lefty and Righty are both persons (not sub-personal entities), and that they are numerically distinct. Lefty and Righty both satisfy the normal physical and psychological criteria for personhood. They qualify as persons. And they are two. They may be exactly alike immediately after fission, but exact similarity does not imply numerical identity. (Two red billiard balls may be exactly similar, yet numerically distinct.) Further, they will soon begin to differ, mentally and physically, so that it would be intolerable to regard them as anything but distinct persons.

According to the remaining version of response (3), Arnold exists after fission composed of Lefty and Righty, now regarded as persons in their own right. This is sheer madness. The postulation of Arnold's existence in this circumstance (in addition to that of Lefty and Righty) does no work whatsoever. It is completely idle. Second, can we really make any sense of the idea that one person might be composed of two separate persons? That one person might be composed of two bodies and two minds? To be a single person is to possess a unified mental life. (This is why we are sometimes reluctant to regard a split-brain patient as constituting a single person.) Yet, supposedly, after fission Arnold is permanently composed of two unconnected spheres of consciousness. How could they possibly constitute a single person? If Lefty believes that Clinton will win the next election, and Righty believes that he will not, does Arnold believe that Clinton will both win and lose the next election? Such problems multiply. It seems that all ways of understanding response (3) skewer our concept of a person to such an extent that they cannot be taken seriously.

5 Fission of persons (cont.)

(4) 'The case of Arnold's fission has been misdescribed. Lefty and Righty exist prior to fission, but only become spatially separate after fission.' This theory also has different versions. Some philosophers think that only Lefty and Righty occupy the pre-fission body, and that the name Arnold is ambiguous. Others think that three people (Arnold, Lefty and Righty) occupy the pre-fission body, but that only Lefty and Righty survive fission. The differences between these versions of the theory will not concern us.

This theory is very strange. It involves a tremendous distortion of our concept of a person to suppose that more than one person occupies the pre-fission body. Surely to one body and a unified mind, there corresponds only one person? However, the strangeness of response (4) may depend on one's general metaphysics. In particular, the degree of strangeness may depend on whether we accept a three- or four-dimensional view of continuants such as persons.

On the three-dimensional view of persons, persons are wholly present at all times at which they exist (much as a universal, such as redness, is said to be wholly present in each of its instantiations). On this view, persons are extended only in space, not in time, and have no temporal parts. On the four-dimensional view of persons, persons are four-dimensional entities spread out in space and time. Persons have temporal parts as well as spatial parts. Hence, at any given time, say 1993, only a part of me is in existence, just as only a part of me exists in the spatial region demarcated by my left foot. (See Time for more on the contrast between three- and four-dimensional views.)

On the three-dimensional view of persons, response (4) is not just strange but barely intelligible. Consider a time just prior to fission. On this view, two wholly present persons (entities of the same kind) occupy exactly the same space at the same time. This ought to be as hard to understand as the claim that there are two instantiations of redness in some uniformly coloured red billiard ball. On the four-dimensional view, however, Lefty and Righty are distinct persons who, prior to fission, share a common temporal part. It ought to be no more remarkable for two persons to share a common temporal part than for two persons (Siamese twins) to share a common spatial part.

Suppose, for present purposes, that we accept the four-dimensional view. Response (4) is still counter-intuitive. It is implausible to hold that two persons (Lefty and Righty) share a common temporal segment in the absence of any psychological disunity. We should be loath to give up the principle that to each psychologically unified temporal segment there corresponds just one person. Second, there is the problem of how we are to account for the coherence and unity of the I-thoughts associated with the locus of reflective mental life that occupies the pre-fission body. How can there be such unity if two persons occupy that body? These objections to response (4) may not be decisive, but they do show that the multiple occupancy view is problematic, and we should avoid it if we can.

(5) ‘What’s the problem? When Arnold divides into Lefty and Righty, Arnold ceases to exist (one thing cannot be two). Lefty and Righty then come into existence, and are numerically distinct, though initially very similar, persons.’ This is the response I favour. When Arnold divides, there are two equally good candidates for identity with him. Since they are equally good, and since one thing cannot be two things, Arnold is identical to neither. And since there is no one else with whom we could plausibly identify Arnold, Arnold no longer exists. This response respects the logic of identity, and does not violate our concept of a person by supposing that one (post-fission) person is composed of two persons or that more than one person occupies the pre-fission body. This is a victory for common sense!

Indeed it is so. But it is important to realize that, in embracing response (5), we are committing ourselves to a quite particular conception of the identity over time of persons. On this view, Arnold is not Lefty. Why is this true? The reason given is not: because Arnold and Lefty do not have the same body, or because Arnold and Lefty do not have the same (whole) brain. (These would anyway be bad reasons - see §1.) The reason is that one thing cannot be two. Arnold is not Lefty because Righty also exists. Whether Arnold continues to exist depends upon whether he has one continuer or two. Since Lefty and Righty are causally isolated from each other, this implies that the identity over time of a person can be determined by extrinsic factors. Theories that allow for such extrinsicness are sometimes called best-candidate theories of personal identity. According to these theories, B at t_2 is the same person as A at t_1 if and only if there is no better or equally good candidate at t_2 for identity with A at t_1. If there are two equally good candidates, neither is A.

Are such theories, and hence response (5), acceptable? Some philosophers have thought not, but for bad reasons. It has been thought that best-candidate theories violate the widely accepted thesis that identity sentences are, if true, necessarily true and, if false, necessarily false. Is not the upshot of response (5) precisely that Arnold is not Lefty, but that had Righty not existed (had the surgeon accidently dropped the right hemisphere, for example), Arnold would have been Lefty? Here we have to be careful. The widely accepted thesis is that identity sentences containing only rigid singular terms (that is, terms which do not shift their reference across possible worlds) are, if true, necessarily true and, if false, necessarily false. We can read the term Lefty as rigid or as non-rigid. If it is non-rigid (perhaps abbreviating the definite description ‘the person who happens to occupy the left-hand branch’), then it is true that, had Righty not existed, Arnold would have been Lefty. But this result is consistent with the necessity of identity and distinctness. If Lefty is rigid, then the best-candidate theorist, if he is to respect the necessity of identity, must deny that Arnold would have been Lefty if Righty had not existed. If Righty had not

existed, Arnold would then have occupied the left-hand branch, but that person (namely, Arnold) is not Lefty. Lefty doesn't exist in the nearest world in which Righty does not exist, though an exact duplicate of Lefty - twin Lefty - exists there.

Best-candidate theories do not violate the necessity of identity. However, they do have consequences that might be thought objectionable. Consider again the world in which Arnold divides into Lefty and Righty. According to the best-candidate theory, Lefty can truly say, 'Thank goodness Righty exists, otherwise I wouldn't have existed'. Given that Lefty and Righty exert no causal influence on each other, such dependency is apt to seem mysterious.

These consequences are not objectionable. They simply illustrate the fact that properties like being occupied by Lefty (where Lefty is understood to be rigid) are extrinsic properties of bodies. That is, whether the left-hand body has the property of being occupied by Lefty, rather than by Twin Lefty, is fixed by an extrinsic factor (namely, the existence or non-existence of Righty). But this is not counter-intuitive. The property being occupied by Lefty is not a causal property of a body. In contrast with properties of shape and weight, and so on, this identity-involving property does not contribute to the causal powers of any body in which it inheres. (The causal powers of the left-hand body are unaffected by whether Lefty or Twin Lefty is the occupant.) It is typical of a non-causal property that its possession by an object may depend upon what happens to other objects which exercise no causal influence on it. For example, the property of being a widow is not a causal property and, unsurprisingly, whether a woman is a widow may depend upon what happens to someone who, at the relevant time, exercises no causal influence on her. Response (5) teaches us that identity-involving properties (like being occupied by Lefty) are also extrinsic. This is not a counter-example, merely a consequence.

The best-candidate theory provides the most satisfying response to the case of fission. It also reveals something important about our concept of personal identity: its structure is that of an extrinsic concept. This result may be surprising, but it is not objectionable. If we combine this result with the central claim of the last section, we arrive at the following modified sufficient condition for personal identity over time: A at t_1 is identical to B at t_2 if A stands to B in the relation of psychological continuity with a cause that is either normal or continuous with the normal cause, and there is no better or equally good candidate at t_2 for identity with A at t_1.

6 Value theory

In this final section, I investigate the implications (if any) of the metaphysics of personal identity for value theory. A contemporary philosopher, Derek Parfit, is the most well-known advocate of such implications: he argues that the most plausible metaphysics of persons yields radical conclusions for ethics and rationality (value theory).

It has, of course, long been acknowledged that there is a link between theories of persons and value theory. For example, a religious person's belief that we are immaterial souls will obviously bear on their view of the morality of abortion and euthanasia. However, in this case, the value of persons is not called into question; what is in question is simply the extension of the concept person. The intent of Parfit's project is far more subversive: it is to undermine the significance we currently attach to personal identity and distinctness. Whether or not it is ultimately successful, it is important to recognize the form or shape of this project.

The central feature of Parfit's value theory is the thesis that personal identity is not, in itself, an important relation. It is various psychological relations which matter, relations which are concomitants of personal identity in the normal case (but not, for example, in the case of fission). According to this theory, it would be irrational of me strongly to prefer my own continued existence to death by fission.

I will be concerned with arguments for the thesis that personal identity is not what matters. This thesis has two strands. One strand is that personal identity over time is unimportant; the other strand is that personal identity at a time is unimportant. (These are the diachronic and synchronic strands, respectively.) The thesis that the identity of a person over time is unimportant has been taken to undermine the self-interest theory of rationality, and has implications for the tenability of trans-temporal moral notions such as compensation, responsibility and personal commitment. The thesis that the identity and distinctness of persons at a time is unimportant has been thought to lend support to utilitarianism.

The thesis that personal identity over time is unimportant implies that pure self-interested concern is irrational. That is, it is irrational for me to be especially concerned about the fate of some future person just because that

person is me. It follows that the self-interest theory of rationality is false. According to this theory, which has dominated so much thinking about rationality (see Rationality, practical) there is only one future person that it is supremely rational for me to benefit: the future person identical to me. Since the self-interest theory places immense weight on a relation which has no rational significance, this theory cannot be correct.

Further, if we do not believe that personal identity over time is important, this may change our attitude to punishment, compensation and commitment. Consider a case where there are only weak psychological connections between different stages of the same life. (For example, a one-time criminal may now be completely reformed, with a new and more respectable set of desires and beliefs.) On the present view, the grounds are thereby diminished for holding the later self responsible for the crimes of the earlier self, or for compensating the later self for burdens imposed on the earlier self, or for regarding earlier commitments as binding on the later self. The truth that the earlier person is the later person is too superficial or unimportant to support the opposite view.

The thesis that the identity and distinctness of persons at a time is unimportant has been taken to imply that the fact of the 'separateness of persons' is not 'deep', and that less weight should be assigned to distributive principles. The synchronic thesis thus supports (in part) the utilitarian doctrine that no weight should be assigned to distributive principles: we should simply aim to maximize the net sum of benefits over burdens, whatever their distribution (see Utilitarianism).

These are radical claims. They are all underwritten by the thesis that personal identity is not what matters. What are the arguments for this thesis? I shall discuss one argument for the diachronic thesis (the argument from fission), and one argument for the synchronic thesis (the argument from reductionism).

Recall our earlier discussion of fission. I argued that the most plausible description of fission is that the pre-fission person is numerically distinct from the post-fission offshoots. This constitutes the first premise of the argument from fission (which I will present in the first person): (1) I am not identical to either of my fission products. The second premise is this: (2) fission is not as bad as ordinary death. This premise is taken to imply a third: (3) my relation to my offshoots contains what matters. The first and third premises jointly imply that personal identity is not what matters.

This is an interesting argument, which has had many adherents in recent years. But there is a problem with it. The problem concerns the move from the second to the third premise. The second premise is certainly true: the prospect of fission is not as bad as that of ordinary death. What grounds this premise, and what exhausts its true content, is simply that presented with a choice between those two options, virtually everyone would choose fission. Such a choice is both explicable and reasonable: after fission, unlike after ordinary death, there will be people who can complete many of my projects, look after my family, and so on. However, if the third premise is grounded in the second, the claim that my relation to my offshoots contains what matters merely reflects the innocuous truth that fission is preferable to ordinary death. This robs the argument of any radical import. Its conclusion does nothing to undermine the rationality of self-interest, or the rationality of strongly preferring continued existence to both fission and ordinary death. (This argument is not improved if it is merely asserted that fission is just as good as ordinary survival. What is the argument for this claim?)

What of the argument from reductionism? Reductionism is the view that a description of reality which refers to bodies and experiences, but omits reference to persons, can be complete. It would leave nothing out (see Persons §3). The argument from reductionism attempts to show that, if reductionism is true, the fact of the separateness of persons (the fact that you and I are distinct persons, for example) is not deep or significant, and hence less weight should be assigned to distributive principles.

The argument can be presented as follows. Suppose that reductionism is true: reality can be completely described without reference to persons. If such a complete and impersonal description is possible, how can the boundaries between persons be important? Failing an answer to this question, the argument from reductionism concludes that the boundaries between persons are not morally significant.

The validity of this argument turns on the truth of the general principle that if reality can be completely described without referring to Fs, then the boundaries between Fs cannot be of any importance. Both the interpretation and plausibility of this principle are unclear. A more definite worry is that reasons may be presented for dissatisfaction with the argument's premise, reductionism about persons. (In particular: can our mental life really be completely

described in impersonal or identity-neutral terms?) Unless those objections can be met, we should reject the argument from reductionism.

The central arguments for the thesis that identity is not what matters are both open to dispute. The failure of these arguments emphasizes how difficult it is to undermine the importance I attach to the fact that such-and-such a person tomorrow is me, and to the fact that you are not me. Unless other arguments are forthcoming, we can continue reasonably to believe that personal identity is important, and to endorse the traditional views in ethics and rationality which that belief supports.

Personalism

Personalism is the thesis that only persons (self-conscious agents) and their states and characteristics exist, and that reality consists of a society of interacting persons. Typically, a personalist will hold that finite persons depend for their existence and continuance on God, who is the Supreme Person, having intelligence and volition. Personalists are usually idealists in metaphysics and construct their theories of knowledge by inference from the data of self-awareness. They tend to be nonutilitarian in ethics and to place ultimate value in the person as a free, self-conscious, moral agent, rather than in either mental states or in apersonal states of affairs. Typically, holding that a good God will not allow what has intrinsic value to lose existence, they believe in personal survival of death.

The term 'personalism', even as a term for philosophical systems, has myriad uses. There is said to be, for example, atheistic personalism (as in the case of McTaggart, famous for embracing both atheism and the immortality of the soul), absolute idealistic personalism (Hegel, Royce, Calkins), and theistic personalism (Bowne, Brightman, Bertocci). Leibniz and Berkeley are seen as early personalists; both were theists and idealists. Kant, while not strictly a personalist, was influential in personalism's history. In particular, B.P. Bowne (1847-1910) borrowed freely from Kant, while refusing to accept a Kantian transcendentalism in which our basic concepts or categories apply in a knowledge-giving way only to appearances and not to reality. R.H. Lotze made personality and value central to his worldview, and was a European precursor of American personalism.

1 Criteria for personalism

Some negative criteria may be helpful. Presumably one is ruled out as a serious candidate for being a personalist if one supposes that persons are made up out of some more ultimate constituents on which they depend, or if one supposes that something else has as great value as or greater value than self-conscious agents, or if one supposes that there is neither a Supreme Person nor any other person who exists independently of nonpersons. Presumably, again, a personalist does not think that persons have proper parts - that persons can themselves be components of other persons. To put things positively, for the personalist, persons are simple (noncomposite), of an intrinsic worth not equalled by nonpersons, and at least one of their number is ontologically ultimate.

Kant, Berkeley, Lotze and Bergson were major philosophical influences on Borden Parker Bowne (1847-1910), the principal founder of an American school of philosophy standardly called 'personalism'. This is the central sense of the term, at least in so far as it is applied to American philosophy. Bowne's philosophy is idealistic, theistic and (of course) personalistic. He finds in human self-consciousness, and especially religious and moral experience, clues to the nature of things. In his view, beginning with direct awareness is not only the safest, but the only proper method in epistemology and the only route to a correct metaphysic. Persons are self-conscious agents. In the self-awareness of persons lies the basis of knowledge and the proximate source of continuity through change, a personal God being the ultimate source of all finite being:

> Now when we consider our life at all critically, we come upon two facts. First, we have thoughts and feelings and volitions which are inalienably our own. We also have a measure of self-control, or the power of self-direction. Here, then, we find in our experience a certain selfhood and a relative independence. This fact constitutes our personality. The second fact is that we cannot regard ourselves as self-sufficient and independent in any absolute sense. And a further fact is that we cannot interpret our life without admitting both of these facts.
>
> (Bowne 1908: 280-1)

2 The personalist worldview

Personalism, beginning with these facts, develops a worldview that begins with immediate, self-conscious experience and interprets not only the life of the individual but the world at large in personalistic terms. This involves the claim that the basic categories or fundamental concepts of our thought should be understood in terms applicable to persons and their experiences.

The notions of substance, unity, identity and change find their home in personal unity and identity. Each person,

aware of themselves as having fleeting experiences and as existing throughout those experiences, is acquainted with a self-conscious intelligence that experiences change and hence endures. What unifies our experiences at any time is that all are states belonging to a single mind, and what provides experiential continuity over time is that mind's continued existence as a subject of experience. Our self-awareness, then, gives us knowledge of our status as mental substances or selves; memory plus self-awareness grants us knowledge of our own identity and continuity.

The notions of contingency, dependence and freedom receive similar treatment. Each person is aware of thinking and acting, affecting their environment and guiding much of the course of their thought and conduct; they are also aware of things that intrude themselves on their attention, impede their will, and externally aid or thwart their wellbeing. Thus there is consciousness both of a degree of independence, in which one somewhat transcends one's environment, and a degree of dependence, in which one's life and wellbeing are dependent on what one encounters. We are aware of being able to act freely within a large but not unlimited framework. This experiential complexity is an accurate clue to our existence as distinct but dependent creatures, individuals who are finite responsible agents.

The category of causality also receives personalistic analysis in connection with Bowne's idealism. This view, in part inherited from Berkeley (§§3, 6-8), consists in holding that there are no mind-independent extended things; what ordinary perception consists in, and what science's laws range over, is human experiences with perceptual contents. There are then, in Bowne's view, no physical objects, only perceptual experiences, and science does not require the existence of mind-independent things. In addition, our perceptual experiences succeed one another, but nothing in our awareness of them informs us that a preceding perceptual experience brings about or produces its successor; causality, in so far as perception reveals it or science discusses it, is but a matter of sequential regularities. Science records perceptual regularities but does not recount genuine causal connections.

None of this is intended to dismiss science or to deny its achievements. Bowne here echoes Berkeley's view that, in effect, while it is clear that the laws of physics are true, it is not at all clear that what they are true of is mind-independent. The equations of basic physics presumably are correct; what they range over is not a matter for science to decide. Direct awareness, however, does decide it, and what they are true of is perceptual experiences. Whatever the merits of this view of science, it was neither Berkeley's nor Bowne's intention to reject scientific data. Bowne was quite content to accept evolutionary theory, and viewed it (in an idealist version) as telling us much about the process by which God brought about finite persons in an environment suitable for moral growth and religious awareness.

None the less, the fact that science is possible is, suggests Bowne, highly significant. It is not logically impossible that our experiences should be random and our attempts to make sense of our perceptual environment - to predict, understand, explore and exploit it - regularly fail. That our perceptual environment is composed of experiences with perceptual contents rather than extended mind-independent objects in no way precludes this unfortunate scenario as a live option; the perceptual world might have been simply incoherent. Since we do not produce our perceptual experiences, we do not cause their orderliness.

The concepts of space and time also receive personalistic treatment. If all there is to what we refer to as extended physical objects is the contents of our perceptual experiences, then we have no reasons to suppose that space itself has mind-independent existence. Space is nothing beyond relationships between human experiences with perceptual content. Since the mind itself is not identical to its perceptual experiences or reducible to the contents of those experiences, minds are not in space.

More surprising, perhaps, is Bowne's contention that the mind itself is not in time. Time, too, he claims, is but a relationship between human experiences (perceptual or not), and since the mind is what *has* experiences, it is not included in relationships that hold only among its experiences. Hence it is not in time. (Presumably Kant's views particularly influenced Bowne here.)

3 Idealism and theism

In the case of each of the basic concepts discussed above, Bowne contends, we find no reason to suppose that their role in knowledge resides in ranging over things that are neither minds nor mind-dependent. Neither do we find reason to think that what they apply to in knowledge-giving ways is something less or other than what is actually

there to be known.

The possibility of science, Bowne holds, requires explanation. So does our existence as enduring individuals. Further, our existence, not only as selves, but as agents who partially transcend their environments also requires explanation.

Bowne contends that the only causation we experience is the exercise of our own powers as agents; here, he holds, we are aware of something being brought about or produced by something else, not merely of one kind of thing temporally following some thing of another kind in a way typical of members of those kinds. Since we have experiences that we did not cause that reflect opinions we do not hold, values we do not accept, or plans we did not make, and since we generally represent others as aiding or opposing us, and agreeing or disagreeing with us, it is most reasonable to ascribe these to minds like ourselves. The idealist's ground for believing in minds other than one's own is that experiences one has but did not cause are to be explained by one's mind being affected by another mind - mental telepathy (or its close cousin).

Further, if we stick to what our experience suggests, then we will explain the existence of mental substances which enjoy continuity of existence and regularity in sense perception by a mind whose effects these things are - a God who has created us as real but limited agents. In this way, among others, Bowne's idealism and his monotheism mesh. Berkeley had suggested that those perceptual contents that we refer to as providing our natural environment are best viewed on the analogy of a divine language - as experiences that God causes and which manifest a constant structure that renders our experience manageable, that is, as a case of sustained benevolent mental telepathy (or its close cousin). Bowne follows Berkeley's example.

Similarly, we will explain the existence of finite minds by the creative action of an infinite mind whose existence does not itself need explanation, and as we find that our actions, in so far as they are rational, stem from our purposes, we may take it that this mind intended to produce creatures such as ourselves. Thus we are led to believe in a personal God possessed of intelligence and will and (since it is good that persons be created) moral goodness. Theism provides a single explanation that traces each of these facts to the same source. Of course, it is logically possible that these inferences may have led us to false conclusions, but they are eminently reasonable inferences - more so than any competitors; and we have no good reason to think the conclusions in question to be false.

Since, Bowne argues, no mind is or can be a part of any other mind - necessarily each is distinct from every other - the notion of a single cosmic mind of which each finite mind is a piece or a partial manifestation is incoherent. Further, our independence, limited though real, argues against any such view, as do the facts that we have false beliefs and perform wrong actions. So we may dismiss any notion of a 'world mind' of which we are modes.

Similarly, since we plainly are aware of our own existence and experiences, we may dismiss any suggestion that our self-awareness is somehow illusory; for that matter, illusions too require self-conscious subjects. Hence we may also dismiss any notion of there being a qualityless reality underlying the one we experience, and the view that what exists is utterly unlike what we experience.

At this point, personalism's metaphysics links up with its ethics. Persons as self-conscious agents possessed of freedom have inherent worth; they themselves - not certain of their more pleasant or more contemplative states - are the locus of ultimate value. Since there is a morally good God who will not allow intrinsic personal worth to be destroyed, there is individual immortality.

4 Howison and Brightman

George Holmes Howison (1834-1916) was another American personalist. A philosopher and mathematician, he graduated from Marietta College (Ohio) and taught mathematics at Washington University (St Louis), where he joined the St Louis Philosophical Society. He also taught philosophy at the Massachusetts Institute of Technology, Harvard Divinity School, and the Concord School of Philosophy, moving in 1884 to the University of California to organize a philosophy department there.

In sharp contrast to Bowne, Howison thought that a person who depended for existence on God could not be a free moral agent. Hence he posited self-determining persons, each of whom seeks in their own way to fulfil themselves as an individual. Persons are not created and have no beginning to their existence. In so far as one seeks fulfilment properly, one does so in ways that do not infringe on others doing likewise. God, on his account, serves as an

example of the moral ideal - a sort of Aristotelian final cause rather than an efficient cause, a standard of perfection but not a creator. Howison views evolution not as having produced a society of interacting minds each seeking fulfilment, but as the product of that seeking.

Bowne's successor at Boston University was another personalist, Edgar Sheffield Brightman (1884-1953). A student of Bowne's, he taught at Nebraska Wesleyan University (1912-15), Wesleyan University (1915-1919), and in 1919 at Boston University, where in 1925 he became the first Borden Parker Bowne Professor of Philosophy. Perhaps his best-known suggestion is that the divine nature contains a 'given' which God's will neither created nor approves. This, Brightman held, is the primary source of evil. God is constantly gaining control over the given, and thus growing as a person, but complete victory is not in sight. While distinctive, this perspective is typical of neither monotheism nor personalism. Bowne's own approach to evil appealed to human freedom and the conditions under which the growth of finite minds to moral maturity is possible.

Personalism as a school has not achieved the fame or influence of pragmatism (another American philosophical perspective). It is most accurately seen as a type of theistic idealism that does not purport to offer a new philosophical perspective. In its articulation by Bowne, and later Brightman and Bertocci (Brightman's successor at Boston), its philosophical perspective is at least as clear and cogent as its contemporary competitors.

Persons

We are all persons. But what are persons? This question is central to philosophy and virtually every major philosopher has offered an answer to it. For two thousand years many philosophers in the Western tradition believed that we were immaterial souls or Egos, only contingently attached to our bodies. The most well-known advocates of this view were Plato and Descartes. Few philosophers accept this view now, largely because it is thought to face a number of intractable metaphysical and epistemological problems (for example: how can an immaterial soul or mind interact with the material world? How can I know that you have a soul?). The recoil from Cartesianism has been in three different directions. One direction (the animalist) emphasizes the fact that persons are human beings, evolved animals of a certain sort. A second direction (the reductionist) is represented by David Hume: the self or person is not a Cartesian entity, it is a 'bundle of perceptions'. Finally, there is a theory of persons influenced by the views of John Locke, according to which persons are neither essentially animals nor reducible to their bodies or experiences.

1 What is a person?

We can all tell persons apart from other kinds of thing, such as kangaroos, mountain ranges and billiard tables. We are also very good at re-identifying the same person at different times. These are cognitive skills we all possess and exercise effortlessly all the time. So we all know that Madonna is a person but the Empire State Building is not, and the 1990 Governor of Arkansas is the same person as the 1997 US President. But can we say anything at a general or abstract level about the grounds of these uncontroversial truths?

Whatever else might be required to be a person, it seems clear that a person is a mental being. A person is the type of entity that possesses a mind. (The mind does not have always to be conscious: a sleeping or comatose person is still a person.) We can be more specific. Not just any mental being is a person. My cat is a mental being - it can feel pain or hunger, for example - yet it is not a person. So a person is (at least) a being that possesses a particular sort of mind. A person does not just have sensations of pain and pleasure, but also intentional, world-directed, mental states like belief, desire, fear and hope.

Indeed, persons possess a range of particularly sophisticated mental states, including self-reflective mental states. I am capable of having not just the belief that it is raining but also beliefs about myself. These are not just beliefs about someone who happens to be me (as when I think 'the person born on such-and-such a day is Scottish', referring to myself but forgetting that *I* am that person). They are fully self-conscious beliefs about myself, the sort of beliefs I have when I say 'I remember that it snowed last Christmas' or 'I intend to holiday in Fiji when this term is over'. Persons are self-conscious mental beings. This observation is confirmed when we reflect on how much of what matters in our mental life and social interactions presupposes the self-consciousness of ourselves and others.

This view of persons was expounded clearly by John Locke in the seventeenth century (see Locke, J. §8). Locke wrote that a person is 'a thinking, intelligent being, that has reason and reflection, and can consider itself as itself, the same thinking thing, in different times and places' (1689, 2 (27): 9). In this definition, Locke specifies some of the elements that comprise our concept of self-consciousness. In particular, he cites thinking, intelligence, reason, reflection and the ability to engage in tensed first-person judgements. These features he holds to be constitutive of our concept of a person. We now have the more abstract and general account we were seeking of why Madonna is a person and the Empire State Building is not. In addition, we also have a more abstract and general account of the grounds for our ordinary judgements of personal identity over time. On this view, the reason why the 1990 Governor of Arkansas is the same person as the 1997 US President is because a single stream of consciousness (continuity of character, beliefs intentions and so on) uniquely links the 1990 Governor with the 1997 President (see Personal identity §1).

An important feature of Locke's account is that his definition of a person in no way presupposes the answer to a more traditional question: namely, to what ontological category do persons belong? That is, are persons immaterial (non-spatial) souls only contingently attached to their bodies (as Plato and Descartes believed)? Are persons wholly material beings? If so, are persons necessarily animals of a certain sort, or might there be robot persons? On Locke's view, these questions cannot be answered simply by examination of our concept of a person.

Reflection on what it is to be a person cannot alone decide the question of whether we are immaterial souls, animals or bionic beings. In order to decide that question we need to investigate ourselves empirically, albeit in a fairly undemanding way. On the strongest version of Locke's view, not only is it not true a priori that all persons are animals, it is not necessary either. If all persons are human beings, this is just a contingent truth.

2 Persons and human beings

We must be clear about what is and what is not controversial in Locke's view. It is not controversial that the features Locke cited (reason, reflection and so on) are central to our concept of a person. What has seemed controversial to some is the stronger claim that truths about the ontological status of persons (for example, that all persons are animals) are contingent. This stronger claim is denied by animalists. They hold that all persons *must* be animals. They do not hold that all persons have to be human beings - chimpanzees and dolphins, for example, could qualify as persons if their behaviour revealed a suitably impressive mental life.

This move away from the Lockean position is apt to seem unpersuasive. To start with, animalists can hardly be presenting their definition as an a priori conceptual truth. People who believe in the actual existence of non-animal persons (God, angels, souls and so on), or people who believe in the possibility of robot persons, do not appear to be committing any conceptual error. Further, the truth that I am a human being (or, more generally, an animal) seems resolutely a posteriori. Animalists must therefore conceive of their definition as a necessary a posteriori truth. And its source must lie in the further supposed truth that animality is a necessary a posteriori constraint on possession of the mental life which is characteristic of persons. But what reason do we have to believe this? As far as I can see, we have none.

More tellingly, the most plausible description of certain thought experiments counts against the animalist position. I can make perfectly good sense of the possibility that I might gradually become an entirely bionic being. My various bodily and brain parts may gradually be replaced by functionally identical bionic parts. Provided that the changes preserve my continuing mental life, abilities and appearance, we would have little hesitation in saying that I survived a process of total replacement. Yet, at the end of the process, I am not an animal of any sort. Consequently, it cannot be true that all persons must be animals. Hence, we have good reason to think that the truth that all persons are animals is merely contingent. In addition, we also have good reason to think that the relation between a person and the human being they share their matter with is not that of numerical identity. If I can survive the destruction of the human being with whom I am presently spatially coincident, I cannot be identical to that human being. The Lockean view has been vindicated.

3 Reductionism

The issue of reductionism is perhaps the most complex topic that any theory of persons must address. In order to assess reductionism, we must be clear about what the position involves, what reasons there are to believe in it, and what arguments there are against it. Reductionism is an ontological view of persons. We can begin to understand the view by contrasting it with two different ontological views of persons. One view is Cartesian: persons are immaterial substances which are only contingently linked to their bodies (see Descartes, R. §8; Dualism). The other view, which we might call the Intermediate view, holds that persons are psychophysical substances, which are necessarily embodied. This is a version of the Lockean view defended in the previous section.

Unlike defenders of the latter views, the reductionist holds that the ontological status of persons is secondary or derivative. The primary elements of our ontology are mental states (pains, 'thinkings', 'rememberings' and so on) and physical bodies. Reductionism has received expression in a number of ways. The most common is that a person is nothing 'over and above' their body and mental life. Alternatively, facts about persons and personal identity are 'verbal'. It is a verbal issue whether we choose to call two people at different times 'the same person', just as it is a verbal decision whether to call seasickness 'pain'. However, these suggestions are rather vague, and need to be sharpened. The key thought is that we can completely describe all mental and physical events impersonally, without reference to persons. The experiences that make up a person's life, on this view, are not essentially events in the life of a person, any more than the bricks that make up a house are essentially parts of a house.

Thus understood, why should we believe in reductionism about persons? One reason is that reductionism has been

thought to be the only serious alternative to Cartesianism. But as we have seen, this overlooks the possibility of the Intermediate view. It is worth emphasizing that there is no instability in the Intermediate view. This view implies that no reductive account of persons is available. This would be problematic only if all genuine concepts and relations must admit of reductive analyses. That condition is simply a dogma.

It might be thought that another reason favouring reductionism is Hume's famous remark about the unencounterability of the subject in introspective experience. Hume wrote that ' when I enter most intimately into what I call *myself*, I always stumble on some particular perception or other, of heat or cold, light or shade, love or hatred, pain or pleasure. I never catch myself at any time without a perception, and never can observe anything but the perception' (Hume 1739 (1976): 252). However, Hume's failure to encounter himself in experience is a fact about the phenomenology of inner reflection. It does not imply that the self does not exist or that we can completely describe all mental life without reference to persons.

Reductionism thus lacks any compelling motivation. In addition, the view faces a number of difficulties. First, reductionists have a problem explaining why we find it so hard to make anything of the idea of an unowned or subjectless experience. A particular toothache, for example, has to be *had* by someone. Experiences require subjects. But there is a deeper problem for the reductionist. The mental life of a human being does not, of course, simply consist in experiences of pleasure and pain. The mental life of a normal human includes mental states with complex contents, for example, intending to visit grandmother next month, or remembering how Alice Springs looked at dawn last year. The contents of these mental states appear to presuppose personal identity. I can only be said to remember, from the inside, *my own* experiences; I can intend only that *I* do such-and-such. But in that case there seems to be no prospect of a complete and impersonal description of these mental states - personal identity is built into them.

The standard manoeuvre in the face of this objection is to invoke the concept of, for example, quasi-memory. This concept is stipulated to be like ordinary memory in all relevant respects, except that quasi-memory does not presuppose personal identity. I can quasi-remember, from the inside, someone else's experiences. For example, as the result of a brain-graft, I may come to have a quasi-memory of standing in front of the Taj Mahal (even though I know that I have never been to India). Since quasi-memory does not presuppose personal identity, the reductionist can re-describe the psychological life of a person without using terms, such as memory and intention, which presuppose personal identity.

The crucial question is whether the notion of quasi-memory can serve the reductionist's purposes. Is the concept of quasi-memory intelligible independently of the concept of memory? Is the content of a quasi-memory really identity-neutral? Quasi-memories are *illusions* of memory; so the content of a quasi-memory is not identity-neutral, it is merely illusory in respect of its identity-involving content. This parallels what we are inclined to say about the contents of perceptual illusions. Consequently, despite its ingenuity, the retreat to quasi-memory cannot stave off a fundamental objection to reductionism (McDowell 1993: §6). These objections to reductionism, only gestured at here, are powerful. The onus is upon the reductionist to reply to them.

Peter of Auvergne (d. 1304)

Peter of Auvergne, a thirteenth-century Parisian master, wrote extensively on logic, natural philosophy and theology. His thought progresses from modism in logic to an independent synthesis of Aristotelian philosophy along the lines begun by Thomas Aquinas, culminating in a theology reconciling the ideas of his teachers Henry of Ghent and Godfrey of Fontaines. His reputation has been based largely on his association with Aquinas, but recent investigations have shown the independence of his thought.

Peter of Auvergne was a secular master at the University of Paris in the thirteenth century. He was born at Crocq (Crocy) in south-central France, appointed rector of the university on 7 March 1275, awarded the bishopric of Clermont on 21 January 1302, and died 25 September 1304.

Peter's many works allow us to witness his intellectual development. He is credited with writing commentaries on all of Aristotle's works, but some of these have been lost and some surviving works are of doubtful attribution. His earliest commentaries, on the *logica vetus* (old logic), are typical of modistic logic, characterized by a confidence that grammatical analysis can reveal a link between reality, signification and understanding (see Language, medieval theories of; Logic, medieval). His early commentaries are influenced also by the recent assimilation of the *Posterior Analytics*, which motivated the attempt to establish an Aristotelian science based upon universal and necessary propositions. Peter was an early practitioner of the question-commentary in the Faculty of Arts at Paris, although he combines older traditions of textual analysis with his promotion of the modistic programme. The *Posterior Analytics* commentary attributed to him shows a considerable degree of complexity, as do the undoubtedly authentic *Sophismata*. Peter's logical works influenced Simon of Faversham, Durandus of Auvergne and Radulphus Brito.

As a young Master of Arts at Paris, Peter was appointed rector of the university to help settle the conflict between the followers of Siger of Brabant and those of Alberic of Rheims, which indicates his conciliatory personality as well as his considerable reputation among his contemporaries. His fame was sufficiently great to motivate the false attribution to him of works by Albert the Great, Thomas Aquinas, an anonymous imitator (the *Anonymus Matritensis*) and, following the condemnation at Oxford in 1270, works by Siger of Brabant.

However, Peter's greatest fame comes from his association with Thomas Aquinas. The extent of their personal contact is not known, but Peter was one of the earliest influenced by Aquinas' natural philosophy and theology and, most importantly, he completed Aquinas' unfinished commentary on Aristotle's *On the Heavens*. His work was also adapted to complete Aquinas on the *Meteora* and the *Politics*. Five other works of his have been printed among the works of Aquinas. Nonetheless, much modern scholarship has been devoted to showing that Peter frequently disagreed with Aquinas.

Many commentaries on natural philosophy belong to Peter's next stage of development and, if all are authentic, Peter mastered the works of Aristotle to an extent unparalleled since Albert the Great. These works, like medieval commentaries on the *Parva naturalia* in general, have not yet attracted much investigation. The commentary on the *Physics* once attributed to Siger of Brabant, now plausibly attributed to Peter by William Dunphy (1953), belongs to this period; it addresses incipiently many themes of Peter's later *Quodlibets* (see Natural philosophy, medieval).

Peter's commentary on the *Metaphysics* shows an author concerned not merely with understanding Aristotle's text, but also with formulating an Aristotelian metaphysics which accommodates theology as well as explaining the world. Because several Peters from Auvergne flourished at the same period, doubts have been raised about whether the author of the *Metaphysics* commentary is the same as the logician of the 1270s and the theologian of the *Quodlibets*, but scholars now generally accept the single attribution. It may be noted that both the commentaries on the *Metaphysics* and on Porphyry's *Isagōgē* attributed to Peter use the unusual expression 'determination of matter' (*signatio materiae*) in discussing individuation; and *Metaphysics* V q. 32 argues in exactly the same way as does the commentary on the *Categories* q. 50, that identity is a purely mind-dependent relation.

Peter's commentary on the *Ethics* is typical of its milieu; it often follows Aquinas, although in

question-commentary form. His writings on the *Politics* (a question-commentary and a literal commentary adapted to complete Aquinas' commentary) influenced later writers, particularly his views that a virtuous multitude has a right to rule and that laws should serve the many rather than the elite few.

Peter came late to theology, not becoming a master of theology until the end of the 1290s. His theology has been seen as part of a continuing evolution away from the ideas of Thomas Aquinas, because of the influence of his teachers Henry of Ghent and Godfrey of Fontaines; Peter occasionally refuses to take sides in conflicts between the ideas of these two masters. Peter holds that theology is a separate science; he accepts Godfrey's criticism of the view of that theology is a science subalternate to the science of happiness. As a theologian, Peter revises his theory of individuation, accepting Godfrey's view that form is the principle of individuation. Following the impetus of Bishop Tempier's condemnation of 1277, which criticized limitations of God, Peter emphasizes the distinction between God's absolute power and God's ordained power, and insists that God in his absolute power can do anything which does not involve a contradiction; but he holds that the creation of an actual infinity of things involves such a contradiction. Peter defends moderate Aristotelian positions against threats posed by the ideas of Averroes (see Ibn Rushd), such as divine ignorance of particular things or an eternal world, although Peter (like Aquinas) accepts the possibility of an eternal world with its concomitant infinity of souls (see Averroism). At times Peter subscribes to Neoplatonism, in particular the positing of an emanation from the First Cause and a hierarchy of being (see Platonism, medieval).

Only a few questions from Peter's commentary on the *Sentences* seem to have survived. Polemical comments in the *Sentences* commentary by John Quidort (see John of Paris) suggest that Peter held that immaterial beings (such as God and angels) produce effects directly by the intellect, rather than via the will, and that many powers of the soul result from divine illumination (Muller (ed.) 1961).

Peter of Auvergne's long career shows us a thirteenth-century Parisian master of more than ordinary productivity and influence. In outline, his thought progresses from modism in logic to an independent Aristotelian synthesis along the lines begun by Aquinas, culminating in a theology reconciling the ideas of his famous teachers. However, our complete assessment of his contribution is still clouded by uncertain attributions and unedited texts.

Peter of Spain (*c.*1205-77)

For hundreds of years, a number of works in philosophical psychology, medicine and logic have been attributed to a single thirteenth-century author known as Peter of Spain. According to the latest research, however, there were actually two authors of that name. One, who later became Pope John XXI, wrote on medicine and on the soul. In his writings on the soul, this Peter argued for an independent material form that prepared the body for the soul, its substantial form, and he took an Augustinian view of God's role in illuminating the intellect in ordinary cognition. The second Peter of Spain was a Spanish Dominican who wrote the logical works. He is chiefly known for his Tractatus, an influential textbook of logic written before 1250, expounding both traditional topics and the theory of supposition, concerning reference in sentential contexts.

The first Peter was born in Lisbon around 1205, of noble parentage. He completed the liberal arts course at Paris in the 1220s and then studied medicine, probably in southern France, becoming a professor of medicine at Siena in 1245. Peter wrote his medical works, including the famous *Thesaurus pauperum (A Treasury for the Poor)* and his treatises on the soul in the 1240s and 1250s, as well as an exposition of the works of Pseudo-Dionysus. From 1250 Peter lived mostly in Lisbon, enjoying various preferments. In 1272 he became physician to Pope Gregory X, and in 1273 Archbishop of Brage and Cardinal of Frascati. He was elected pope in 1276. As Pope John XXI, he issued two Bulls in 1277 to Etienne Tempier, the Bishop of Paris, ordering the examination of teaching at the University of Paris. Tempier's condemnation of 219 heretical propositions in theology and natural philosophy emphasized the absolute power of God, contributing to the general fourteenth-century stance that the laws of nature are contingent on God's will and reflect no strict impossibilities (see Aristotelianism, medieval). In May 1277 the roof of the pope's private study collapsed and he died of his injuries.

In his treatises on the soul, Peter reveals himself a conservative Augustinian of the stamp of Robert Grosseteste. Pursuing the question why the soul, a unity in itself and the form of the body, should give rise to many organs, he points out that the soul has many powers, and needs different organs to realize these powers in matter. Thus there are sense organs for the sensitive power, muscles for the power of self-movement and so on. He identifies two agent intellects, one within the individual human soul, which abstracts forms as they occur in nature from sensible particulars, and the other God himself, who must illuminate the abstracted form in the soul to impart scientific knowledge. Scientific knowledge presupposes a cognition of the form prior to its realization in the material world, from which we can see why things that have the form must be as they are if they are to realize the form in matter. Thus the soul can understand itself only by understanding its powers as prior to their material implementation in the body, so that it can see what shape the body must take to be the body of such a form. Just as the eyes need light to see, so the intellect needs God's illumination to make natural objects intelligible to it. The soul's intellectual powers are not a product of natural processes, but of God himself, while other powers could be produced purely naturally (see Soul, nature and immortality of the).

The second Peter was most noted for his *Tractatus*, summarizing the logic of his time in twelve tracts, concerning not only the traditional Aristotelian topics but also the theory of supposition, a logical doctrine first developed in the twelfth century (see Language, medieval theories of; Logic, medieval). Peter claims that the signification of a term belongs to it considered in abstraction from the term's occurrence in a particular proposition. Thus, the term 'man' always signifies the universal *man*. However, an occurrence of this term may 'supposit' for different things in different sentences, for instance, for a specified or unspecified individual, or several individuals, as in 'a man is running' 'that man is running' and 'all men are running'. For though the 'natural supposition' of a term is always the same - namely, all past, present and future individuals that fall under the term's signification - its 'accidental supposition' varies with context. Peter assumed that a term, all by itself, has a natural capacity to refer rooted in its signification, and that its use in a sentence may restrict that natural supposition in various ways but in no way accounts for it. All this coordinates well with realism, which explains how universals could be conceived independently of reference to individuals, and takes reference to individuals to depend on a prior grasp of universals (see Realism and anti-realism; Universals). In his *Syncategoremata (On Syncategorematic Words)*, Peter insists that the copula has no function other than joining the predicate and subject terms, which each have their own signification and reference independently of their sentential context. Peter's views on these matters are at odds with those of William of Sherwood, whose characteristically English approach is more friendly to

nominalism (see Nominalism). His *Tractatus* and *Syncategoremata* were written in the 1230s in southern France, at Toulouse or Montpellier, from which the earliest medieval commentaries on these works stem, including those of Robert Anglicus and William Arnaldi.

JOHN LONGEWAY

List of works

Peter of Spain [Pope John XXI] (before 1258) *Expositio libri De anima, De morte et vida, et De causis longitudinis et brevitatis vitae (Explanation of [Aristotle's] On the Soul, On Death and Life and On the Length and Brevity of Life)*, ed. M. Alonso, *Obras filosóficas*, vol. 3, Madrid: Instituto de Filosofico 'Luis Vives', 1952.(Brief commentaries on Aristotle's works.)

Peter of Spain [Pope John XXI] (before 1258) *In De anima (Commentary on [Aristotle's] On the Soul)*, ed. M. Alonso, *Obras filosóficas*, vol. 2, Madrid: Instituto de Filosofico 'Luis Vives', 1944.(A more extended commentary on Aristotle's *On the Soul*.)

Peter of Spain [Pope John XXI] (before 1258) *Scientia libri De anima (The Science of the Book On the Soul)*, ed. M. Alonso, *Obras filosóficas*, vol. 1, Madrid: Instituto de Filosofico 'Luis Vives', 1941.(An exposition of Peter's own views on the soul, closely informed by his study of medicine.)

Peter of Spain [Pope John XXI] (before 1258) *Expositio super libros de Beato Dionisio (Exposition of the Books of the Blessed Dionysius the Areopagite)*, ed. M. Alonso, *Exposiçao sobre os livros do Beato Dionisio Areopagita*, Lisbon: Instituto de alta cultura, 1957.(A theological work, expositing some Neoplatonic mystical treatises bearing on our knowledge of God which were, at the time, semi-canonical because of their attribution to Dionysius the Areopagite, who was supposed to have been converted by St Paul.)

Peter of Spain [Pope John XXI] (1272) *Thesaurus pauperum (A Treasury for the Poor)*, Antwerp: T. Martin, 1947.(A brief medical handbook for poor students who could not afford the more massive volumes from which its information is extracted.)

Peter of Spain [writer on logic] (*c.*1230) *Tractatus* (Treatises), ed. L.M. De Rijk, Assen: Van Gorcum, 1972; trans. J.P. Mullally, *The Summulae Logicales of Peter of Spain*, Notre Dame, IN: Notre Dame University Press, 1945; trans. F.P. Dineen, *Language in Dispute*, Philadelphia, PA: Benjamins, 1990; selections translated in N. Kretzmann and E. Stump, *The Cambridge Translations of Medieval Philosophical Texts: Volume One: Logic and the Philosophy of Language*, Cambridge: Cambridge University Press, 1988.(De Rijk's introduction is important. The translations in Kretzmann and Stump are the best.)

Peter of Spain [writer on logic] (*c.*1230) *Syncategoremata* (On Syncategorematic Words), ed. L.M. De Rijk, trans. J. Spruyt, Leiden: Brill, 1992; trans. J.P. Mullaly, *Peter of Spain: Tractatus Syncategorematum and Selected Anonymous Treatises*, Milwaukee, WI: Marquette University Press, 1964. (Concerns words which do not themselves have signification, but alter the meanings of terms with signification in the sentences in which they occur.)

Peter of Spain [writer on logic] (*c.*1230) *Tractatus exponibilium (Treatise on Exponible Propositions)*, ed. and trans. J. Spruyt, *Peter of Spain on Composition and Negation*, Nijmegen: Ingenium, 1990.(Part of the *Syncategoremata*. Concerns sentences with a misleading grammatical form, usually involving a concealed negation.)

Petrarca, Francesco (1304-74)

With Dante and Boccaccio, Petrarca (known as Petrarch) made the fourteenth century the most memorable in Italian literature. He was also the first great humanist of the Italian Renaissance. He brilliantly and self-consciously exemplified humanism's classical, rhetorical, literary, and historical interests; with him the movement came of age. He was a proponent not only of classical Rome ('What else is history,' he once asked, 'than the praise of Rome?'), but also of contemporary Rome, constantly calling for the popes at Avignon to return to their proper See and urging restoration of Rome as the seat of the Empire, even if that meant supporting the visionary Roman revolutionary Cola di Rienzo. He came to see himself also as a moral philosopher. His ethical interests were closely tied to his cultural interests and personal situation as a lay moralist (though technically he was a cleric). His outlook and method differed from that of contemporary Aristotelians, whom he attacked on a broad cultural front, sounding many of the themes that would become common in subsequent conflicts between humanism and scholasticism in the Renaissance.

1 Life and poetry

Petrarca, known in the English world as Petrarch, was born in Arezzo. The son of a Florentine exile, he left Tuscany with his family in 1312 to become part of the sizeable Italian colony around the papal court of Avignon in Provence, where his father found employment as a notary (see Humanism, Renaissance §1). In 1316, young Francesco was sent to study law at the University of Montpellier and then, in 1320, to the University of Bologna. Petrarca did not want to be a lawyer, and when his father died in 1326 he returned home to live off his inheritance. Around 1330, as his inheritance ran out, Petrarca decided upon a clerical career. He only took minor orders, but the ecclesiastical benefices he accumulated allowed him to live a comfortable life. In 1337 he had a son, Giovanni, and in 1343 a daughter, Francesca, who proved to be a great comfort to him in his old age.

About 1337, after returning from his first visit to Rome, Petrarca had finally had his fill of Avignon and purchased a country home in nearby Vaucluse. He enjoyed his rural retreat immensely, and it was there that he began many of his most important projects. Nonetheless, in 1341, he left Vaucluse for a wider stage: Petrarca had arranged a ceremony for himself in Rome, at which he would be crowned poet laureate. (He believed it to be the first such event since antiquity, but in fact Albertino Mussato had been crowned poet laureate at Padua in 1315.) Wanting the sanction of major political authority, he arranged to have himself 'examined' by King Robert of Naples before proceeding on to the elaborate coronation ceremony in Rome. He also made sure that the Roman authorities conferred upon him all the rights and privileges of a university master in the two disciplines of poetry and history. He then went to Parma to enjoy the patronage of its lord, Azzo da Correggio. He returned to Vaucluse in the spring of 1342.

For the next decade Petrarca frequently returned to Italy for lengthy stays, and in the summer of 1353 finally settled there. To the dismay of his Florentine friends, he accepted the hospitality of the Visconti tyrants of Milan. He continued to travel, once even to Prague on a Visconti embassy, but he maintained his residence in Milan until 1362, when he decided that he preferred to live in Venice. The Republic provided him with the Palazzo Molin on the Riva degli Schiavoni in return for the bequest of his books, which the Venetians (vainly) hoped to make the core of a public library. In the agreement, doubtless in accordance with Petrarca's desires, the Venetian Senate called him a 'moral philosopher'. In 1368, however, Petrarca changed residence yet again, this time moving to Padua and the protection of its tyrant Francesco da Carrara. He died in his country home at Arquà near Padua.

Petrarca had earned the laurel crown in Rome as a Latin poet. Early in his career, he wrote metrical letters (eventually published as the *Epistolae Metricae*); he also wrote Latin eclogues (collected as the *Bucolicum Carmen*) and composed *Africa*, the first Latin epic written since antiquity. Over his career Petrarca wrote more poetry in Latin than in Italian (he referred to his Italian poems as 'mere trifles' in later life), but in the high Renaissance Petrarca's Latin style no longer found favour: the Europe-wide movement of 'Petrarchism' exclusively involved the imitation of his vernacular poetry. Most of Petrarca's surviving Italian poems were the work of his maturity, and Petrarca was refining his major collection of Italian poems (the *Canzoniere* or *Rime Sparse*) until his death. Today his Italian poems are the only part of his writings widely admired in the original.

Although he wrote sonnets on other themes (including the grand patriotic hymn 'Italia mia'), the vast majority of

Petrarca's Italian lyrics concern his love of Laura. He first saw her in Avignon on 6 April 1327, and although she rejected him, Laura remained the abiding love of his life. Inspired by her, Petrarca composed (in the vernacular) the collection of *Trionfi (Triumphs)*, which began with the *Triumphus Cupidinus (Triumph of Love)* in the 1330s. The *Triumphus Pudicitiae (Triumph of Chastity)* (written in the 1340s) celebrated Laura's honour and purity, which Petrarca saw as elevating him as well. After Laura died, he wrote the *Triumphus Mortis (Triumph of Death)* and subsequently the *Triumphus Famae (Triumph of Fame)*, *Triumphus Temporis (Triumph of Time)* and *Triumphus Eternitatis (Triumph of Eternity)*, finishing the collection with the hope of seeing Laura forever in heaven.

2 Ethical writings

At his coronation as poet laureate, Petrarca had made sure that he was also recognized as a historian. He had in fact begun in 1337 a series of biographies of classical, predominately Roman, heroes, called *De Viris Illustribus (On Illustrious Men)*. But by the time of his move to Venice in 1362, he wished also to be considered a moral philosopher. One of his first efforts as a moral philosopher was the unwieldy *Rerum Memorandarum Libri (Books on Matters that Ought to be Remembered)*, begun about 1343 and never completed. Scholars have deduced that it was supposed to be a work on the four cardinal virtues (prudence, justice, courage and temperance) and perhaps the corresponding vices. In fact it is a compilation of examples and anecdotes illustrating the different aspects of prudence.

Far more successful and interesting is the dialogue *Secretum (The Secret)*, first written in the 1340s, when Petrarca was undergoing a mid-life crisis, and subsequently revised. Petrarca has St Augustine examine why he, Petrarca, was suffering from depression (called by the name of one of the deadly sins, *accidia*). With his youth behind him and death waiting just over the horizon, Petrarca still could not shake free of earthly desires, most specifically, of his love of Laura and his desire for fame. The Augustine of the dialogue is quite unhistorical. He is a voluntarist who blames Petrarca's problems on insufficient will power (though towards the end he tells Petrarca to call on God to make good the failings of his will). The dialogue ends with Petrarca understanding better his predicament, but not really having overcome it. Petrarca was in fact a great admirer of Augustine as the master psychologist of the *Confessiones (Confessions)*.

No less personal was the treatise *De Vita Solitaria (On the Solitary Life)*, begun at Vaucluse in 1346. This work has strong religious overtones, but was in fact a lengthy defence of Petrarca's very secular and comfortable life away from the madding crowd and free of commitments that might limit his freedom to write and study. The next year, after visiting his brother Gherardo, a monk at the Carthusian monastery of Montrieux, he more legitimately made many of the same arguments in a paean to monastic life which he entitled *De Otio Religioso (On Religious Leisure)*.

His most 'professional' and largest work as a moral philosopher was the *De Remediis Utriusque Fortunae (On the Remedies of Good and Bad Fortune)*. Inspired by the Stoic ideal of the wise man who does not let the vagaries of fortune affect his inner peace, Petrarca started on his *Remedies* about 1354 and finished in 1366. Though cast in the form of a dialogue, *Remedies* was in essence a recipe book for a life of moderation. If you enjoyed anything, Petrarca told you why you should not be too elated by it. For instance, he explained that the enjoyment of wrestling was senseless for the spectator and insane for the participant. He also offered advice to encourage people who were facing misfortunes: for example, he argued that those who had been blinded were at least spared the many painful sights that life visits upon us. In all, he detailed 122 kinds of good fortune and 132 of bad fortune and their remedies. If some of his remedies strike us as ineffective, it is at least clear that he was striving to be practical and of genuine use to ordinary people.

In his ethical pronouncements Petrarca tended to favour Stoic formulas, but operationally, in his own life, he lived as an Aristotelian, desiring an adequate supply of worldly goods, friends, leisure, moderate pleasures, and the support of the powerful so that he could satisfy to the fullest his creative and intellectual impulses. Nonetheless, he was generally unsympathetic to Aristotle, while usually speaking well of Plato. On the authority of Augustine, he believed that Plato's doctrines harmonized well with Christianity. He especially attacked as opponents of Christianity Aristotle's Arab commentator Averroes (see Ibn Rushd) and contemporary Aristotelians who agreed with Averroes.

These tendencies stand out in one of his last works, the invective *De Sui Ipsius et Multorum Ignorantia (On His Own Ignorance and That of Many Others)*, started in 1367 and completed in 1371. Four Venetians favouring the Aristotelian scientific tradition had pronounced Petrarca a good man but an ignorant one, after discovering at a dinner party in 1366 that he could not answer certain questions in zoology. In response, Petrarca said he would not take account of the classical eloquence for which he was famed, but which his critics disdained; he feigned Socratic ignorance for his own self and attacked as inane the vaunted scientific knowledge of his critics, avowed the superiority of Christian faith over any philosophical wisdom, and while asserting Plato's superiority over Aristotle, confessed that his philosophical guides were the eloquent Latin authors Cicero and Seneca.

3 Humanist culture

As the intellectual weakness of this invective reveals, Petrarca's stance was more cultural than philosophical. In contrast with the legal, scientific and philosophical bias of contemporary learned culture, he proposed a learning dominated by rhetorical, literary, historical and classicist interests. His largest body of writing is his letters, which, inspired by his discovery of Cicero's *Familiar Letters* at Verona in 1345, he gathered, revised and published in several different collections. The first collection was his *Epistolae Familiares (Familiar Letters)*; then came his *Rerum senilium libri (Books of Matters of Old Age)*; he brought together some polemical letters in a collection called *Liber sine nomine (Book Without Name)*; and finally there are various letters of his that he never incorporated into any collection. Addressed to prelates, secular rulers, friends and enemies, Petrarca's letters spread the new culture of humanism as effectively as any of his writings. Since he did not merely study his favourite authors, but conversed with them as well, he even addressed some letters to Cicero and other worthies of antiquity. He also cultivated the other most preferred humanist rhetorical genre, the oration, several times making speeches on behalf of the Visconti (see Humanism, Renaissance §2).

In sum, apart from his vernacular poetry, Petrarca left to posterity not so much a philosophy as a classicizing language, a set of literary genres, a constellation of literary and historical interests, and a body of newly discovered classical texts which gave emerging Renaissance humanism self-awareness and a cultural agenda. He also gave Renaissance humanism its first hero.

List of works

Petrarca, F. [Petrarch] (1304-74) *Opere latine (Works in Latin)*, ed. A. Bufano, Turin: Unione tipografico-editrice torinese, 1975, 2 vols.(Excellent anthology; includes original text with facing Italian translation for the Latin.)

Petrarca, F. [Petrarch] (1304-74) *Canzoniere* or *Rime Sparse*, trans. R.M. Durling, *Petrarch's Lyric Poems: The Rime Sparse and Other Lyrics*, Cambridge, MA: Harvard University Press, 1976.(English translation of Petrarca's vernacular poetry.)

Petrarca, F. [Petrarch] (begun 1330s) *Trionfi*, in F. Neri *et al.* (eds) *Rime, Trionfi e poesie latine*, Milan and Naples: Ricciardi, 1948; trans. E.H. Wilkins, *The Triumphs of Petrarch*, Chicago, IL: University of Chicago Press, 1962.(One of Petrarca's major collections of vernacular poetry. The Neri anthology includes the original text; Wilkins is an English translation.)

Petrarca, F. [Petrarch] (begun 1337) *De Viris Illustribus (On Illustrious Men)*, ed. G. Martellotti, Florence: Sansoni, 1964.(Modern critical edition of Petrarca's series of biographies of classical, predominately Roman, heroes.)

Petrarca, F. [Petrarch] (begun 1340s) *Africa*, trans. T.G. Bergin and A.S. Wilson, New Haven, CT, and London: Yale University Press, 1977.(English translation of the first Latin epic since antiquity. The poem is now more valued for historical than literary reasons; Petrarca did not publish it in his lifetime.)

Petrarca, F. [Petrarch] (begun 1340s) *Petrarch's Bucolicum Carmen*, trans. T.G. Bergin, New Haven, CT, and London: Yale University Press, 1974.(English translation of Petrarca's Latin eclogues.)

Petrarca, F. [Petrarch] (begun 1340s) *Secretum*, in D. Martellotti *et al.* (eds) *Prose*, Milan and Naples: Ricciardi, 1955; trans. W.H. Draper, *Petrarch's Secret*, London: Chatto & Windus, 1901.(Dialogue with Augustine, in which the saint takes a voluntarist approach to solving Petrarca's mid-life anxieties; first written in the 1340s but subsequently revised. Martellotti gives the original text with facing Italian translation of the Latin; Draper is a translation into English.)

Petrarca, F. [Petrarch] (begun *c.*1343) *Rerum Memorandarum Libri (Books on Matters that Ought to be Remembered)*, ed. G. Billanovich, Florence: Sansoni, 1943.(Modern critical edition of one of Petrarca's first works of moral philosophy; it was never finished. A compilation of examples and anecdotes illustrating different aspects of prudence.)

Petrarca, F. [Petrarch] (after 1345) *Epistolae Familiares*, ed. V. Rossi and U. Bosco, Florence: Sansoni, 1933-42, 4 vols; trans. A.S. Bernardo, *Letters on Familiar Matters*, vol. 1, Albany, NY: State University of New York Press, vol. 2, Baltimore, MD: Johns Hopkins University Press, 1975-82.(Petrarca's first collection of letters. Rossi and Bosco is a modern critical edition; Bernardo a translation into English.)

Petrarca, F. [Petrarch] (after 1345) *Rerum senilium libri (Books of Matters of Old Age)*, in *Opera Omnia*, Ridgewood, NJ: Gregg Press, 1965, vol. 2, 812-1070; trans. A.S. Bernardo *et al.*, *Letters of Old Age*, Baltimore, MD: Johns Hopkins University Press, 1975-82, 2 vols.(Petrarca's second collection of letters. The Gregg Press *Opera* is a reprint of the three-volume Basle edition of 1554; Bernardo provides an English translation.)

Petrarca, F. [Petrarch] (after 1345) *Liber sine nomine (Book Without Name)*, ed. P. Piur, *Petrarcas 'Buch ohne Name' und die päpstliche Kurie, ein Beitrag zur Geistesgeschichte der Frührenaissance*, Halle: Niemayer, 1925.(Collection of Petrarca's polemical letters.)

Petrarca, F. [Petrarch] (begun 1346) *De Vita Solitaria (On the Solitary Life)*, in D. Martellotti *et al.* (eds) *Prose*, Milan and Naples: Ricciardi, 1955.(A lengthy defence of Petrarca's comfortable life of study and writing at Vaucluse. Original text with facing Italian translation of the Latin.)

Petrarca, F. [Petrarch] (*c.*1354-66) *De Remediis Utriusque Fortunae*, in *Opera Omnia*, Ridgewood, NJ: Gregg Press, 1965, vol. 1, 1-254; trans. C.H. Rawski, *Petrarch's Remedies for Fortune Fair and Foul*, Indianopolis, IN: Indiana University Press, 1991, 5 vols.(Inspired by Stoic ideals, Petrarca's largest work as a moral philosopher; attempts to offer practical help for ordinary people. The Gregg Press *Opera* is a reprint of the three-volume Basle edition of 1554; the translation includes bibliographical references, indexes and a commentary by Rawski.)

Petrarca, F. [Petrarch] (1371) *De Sui Ipsius et Multorum Ignorantia*, trans. H. Nachod, *On His Own Ignorance and That of Many Others*, in E. Cassirer *et al.* (eds) *The Renaissance Philosophy of Man*, Chicago, IL: University of Chicago, 1948.(Begun in 1367 and completed in 1371. Polemical attack on medieval definitions of scientific knowledge and defence of the superiority of the Christian faith over philosophical wisdom; Petrarca asserts Plato's superiority over Aristotle, and acknowledges his philosophical debt to Cicero and Seneca.)

Petrażycki, Leon (1867-1931)

Leon Petrażycki was a strikingly original philosopher of law whose theoretical system ranged over moral and legal philosophy, theory of science, psychology and sociology. The aim of his philosophy of law is 'Legal Policy', that is, social engineering through law directed at the 'social ideal of love'.

A Polish nobleman, born in the county of Vitebsk (in present-day Belarus), Petrażycki was educated at the Russian high school in Vitebsk and studied medicine and law at the Russian Imperial University in Kiev. From 1890 to 1906, he held a scholarship in Berlin, and from 1898 to 1917 was Professor in History of Legal Philosophy at St Petersburg University. From 1919 to 1931 he held a chair in sociology at the University of Warsaw. He published in German, Russian and Polish.

Petrażycki's ontology is materialist in a broad sense. Values do not exist. Material objects and psychical phenomena do exist objectively, yet causality is an axiom of theoretical reason. His epistemology is moderately realist: science employs empirical observation, induction and deduction, to construct an analogue of reality. Practical reason is founded on the social postulate of love. His methodology demands that theories be neither 'jumping' (too wide: saying about a whole class what is true only for part of it) nor 'lame' (too narrow: saying of part alone what is true of the whole).

His psychology is based on a new classification of psychical phenomena. Beyond feeling, knowing and willing, there exist 'impulsions'. They are passive-active: for example, feeling hunger, one strives for food. Moral impulsions consist of the 'feeling' of one's duty together with an active readiness to do it. Legal impulsions are the only phenomena around which to build an adequate legal theory. So sound legal theory is psychological. Studying law is studying legal impulsions. These are imperatively attributive, that is, concerning one's own duties intertwined with another's rights or vice versa. These are studied by introspection in one's own case, only analogically in others'.

Law is explained in evolutionary terms. A person whose rights are not respected retaliates. The legal psyche is thus aggressive (while the moral psyche, lacking the element of rights, is peaceful). Legal rules and legal concepts adapt themselves unconsciously to achieving unity among legal impulsions of different people. Positive law, and also the law of illegal organizations, laws of games, and so on, are to be studied subject to the same criteria of theoretical adequacy. The impulsions of positive law are attached to intersubjectively cognizable 'normative facts', in the case of 'official law' such as legislation or custom. Legal rules are projections of shared legal impulsions. Doctrinal law makes law more uniform and better adapted to its pacific social function.

Petrażycki accounted for the evolution of law comprehensively since Roman times, and anticipated later theories in many fields, for example, in relation to post-decisional dissonance, the cognitive role of language, and the hypothetico-deductive method in science. Yet legal institutions cannot be fully described in individualistic-psychological terms, and lame theories, not being false, are in many cases better than none at all.

Phenomenalism

On its most common interpretation, phenomenalism maintains that statements asserting the existence of physical objects are equivalent in meaning to statements describing sensations. More specifically, the phenomenalist claims that to say that a physical object exists is to say that someone would have certain sequences of sensations were they to have certain others. For example, to say that there is something round and red behind me might be to say, in part, that if I were to have the visual, tactile and kinaesthetic (movement) sensations of turning my head I would seem to see something round and red. If I were to have the sensations of seeming to reach out and touch that thing, those sensations would be followed by the familiar tactile sensations associated with touching something round.

Rather than talk about the meanings of statements, phenomenalists might hold that the fact that something red and round exists just is the fact that a subject would have certain sequences of sensations following certain others. The phenomenalist's primary motivation is a desire to avoid scepticism with respect to the physical world. Because many philosophers tied the meaningfulness of statements to their being potentially verifiable, some phenomenalists further argued that it is only by reducing claims about the physical world to claims about possible sensations that we can preserve the very intelligibility of talk about the physical world.

There are very few contemporary philosophers who embrace phenomenalism. Many reject the foundationalist epistemological framework which makes it so difficult to avoid scepticism without phenomenalism. But the historical rejection of the view had more to do with the difficulty of carrying out the promised programme of translation.

1 Why phenomenalism?

Philosophers who embraced phenomenalism typically did so in the attempt to defeat scepticism with respect to the physical world. On one historically prominent and intuitively plausible model of our perceptual relations to the physical world, physical objects are different from, but causally responsible for, sensations which allow us to know those objects. Our sensations are the end product of a long causal chain that (we believe) involves our sense organs and ultimately our brain states. In veridical experience, our sensations in some sense represent the objects we take to be their cause. In illusion and hallucinatory experiences, our sensations fail to represent their external causes (see Perception).

This view of perception and the closely related view of the nature of our knowledge of physical objects are grist for the sceptic's mill. It seems easy enough to establish that the subjective, fleeting sensations that cause us to believe in the existence of physical objects never guarantee the truth of what we believe. The representative realist takes sensations to be the *effects* of physical objects, effects that could, in principle, be produced some other way (by artificially stimulating the relevant region of the brain, for example). But if our only access to the physical world is through sensations, then how could we ever establish sensations as a reliable indicator of the existence of physical objects? The most common way we have of establishing one thing as a sign of something else is to establish a correlation between the two in past experience. But we could never correlate a sensation with a physical object different from a sensation if all we have to go on ultimately are sensations. We can establish connections between sensations, but never between sensations and their alleged causes.

The phenomenalist seeks to rescue common sense from the sceptical implications of representative realism. The root of scepticism lies in a mistaken conception of the physical world, the phenomenalist argues. We must avoid the sceptic's attempt to drive a wedge between sensations and objects, by finding a conceptual link between the existence of physical objects and the occurrence of sensations. But we must do so without making the existence of physical objects depend on the occurrence of any *actual* sensations. It seems obvious that the very concept of a physical object is the concept of an object whose existence is independent of minds and their actual experiences. The table I see now can continue to exist even if I leave the room and there is no-one else around to perceive it. If the concept of a physical object is the concept of something that can exist even when it is unsensed, we cannot identify physical objects with sensations. But, the phenomenalist argues, that does not prevent us from analysing the meaning of physical-object statements into more complex statements describing sensations. We should view statements asserting the existence of physical objects as equivalent in meaning to statements describing 'possible' sensations. More precisely we should take physical object statements to be making conditional

assertions about the sensations someone *would* have *were* that person to have certain other sensations. Subjunctive (counterfactual) conditionals of this sort are made true by connections between sensations, and there seems to be no insurmountable difficulty in establishing correlations between past sensations of the sort necessary to establish causal connections between patterns of sensations (assuming, of course, that we will be able to deal with other sceptical problems concerning knowledge of the past and induction) (see Counterfactual conditionals).

Phenomenalism is compatible with a number of different views about the nature both of sensations and of the selves that have sensations. Many of the historically important phenomenalists were sense-datum theorists who analysed a visual sensation, for example, in terms of a subject's being directly aware of a two-dimensional object existing outside of physical space and exemplifying phenomenal colour and shape (see Sense-data). But there is nothing to stop a phenomenalist from embracing a so-called adverbial or appearing theory which identifies sensations with the mind's exemplifying certain non-relational properties (see Mental states, adverbial theory of). Just as phenomenalists may disagree among themselves over the nature of sensations, so too they may disagree over the analysis of that which has sensations. A phenomenalist can take the subject of sensations to be a mind of the sort posited by Berkeley, or can attempt to reduce subjects themselves to 'bundles' of actual and possible sensations (see Mind, bundle theory of).

Because early statements of phenomenalism were often not clear, it is difficult to make any definite claims about the historical origins of the view. There are certainly passages in which the idealist, Berkeley, seemed to suggest the conditional analysis of physical objects in trying to explain how his view that only minds and ideas (which include sensations) exist is compatible with common sense. In one passage he seems to argue that the story of a creation that takes place before the existence of finite minds should be understood in terms of truths about what finite minds would have experienced had they existed ([1713] 1954: 100). A more promising candidate for being the first phenomenalist might be John Stuart Mill (1865). Mill identified physical objects with the 'permanent possibility of sensations' and explained this in terms of the sensations one would have under certain conditions (see Mill, J.S. §6).

2 Criticisms

For their enterprise to be successful, it is necessary that phenomenalists actually produce plausible 'translations' of statements about the physical world into statements employing purely 'phenomenal' language - that is, statements referring to nothing other than minds and their sensations. Any reference to physical objects will 'contaminate' the subjunctive conditionals employed by the phenomenalist and will defeat the whole purpose of the analysis which is to reduce fully talk about the physical world to allegedly less problematic talk about sensations. Historically, the most influential objections to phenomenalism focused on the alleged impossibility of plausibly completing a phenomenalistic analysis. The clearest of these objections was advanced by Roderick Chisholm (1948) and has become known as 'the argument from perceptual relativity'. The phenomenalist, C.I. Lewis, argued (1946) that part of what it means to claim that there is a doorknob in front of me and to the left is that if I were to seem to see the doorknob and seem to be initiating a certain grasping motion, then in all probability the feeling of contacting a doorknob would follow. Chisholm points out that if the conditional really were part of what the existence of a doorknob involved, then it would be impossible for the doorknob to be there without the conditional being true. But it is easy to imagine a situation in which, though the doorknob is there, I would not be able to have any tactile sensations of it. My hand might be anaesthetized; then, even though the doorknob is there, I would not feel anything upon seeming to reach out to touch it. The proposition that there is a doorknob there does not entail anything about what sensations I would have were I to have others, because the sensations I would have always depend on facts about the internal and external *physical* conditions of perception (facts about the lighting conditions, sense organs, and so on). We cannot, however, revise the conditionals we employ in a phenomenalistic analysis to make reference to standard or normal physical conditions of perception (the argument goes) without referring to the physical world and thus defeating the goal of providing an analysis that refers to nothing other than connections between sensations.

Another closely related objection to phenomenalism argues that contingent subjunctive conditionals of the sort employed by phenomenalists in their analyses presuppose *lawful* regularities between sensations. But again, because sensations are always causally dependent on physical conditions, there simply are no lawful regularities involving sensations alone.

The above objections are often presented by philosophers sympathetic to the general philosophical framework presupposed by phenomenalists. Certainly many contemporary philosophers reject many of the assumptions that motivated phenomenalists. Thus, for example, many contemporary epistemologists reject the kind of foundationalism that led phenomenalists to worry that a resolution of sceptical problems was impossible if we separate physical objects from sensations. A good many of these epistemologists embrace some version of externalism which allows one to know facts about the physical world simply by having one's beliefs caused in the appropriate way (see Internalism and externalism in epistemology). Still other contemporary philosophers reject the conception of philosophical analysis as an attempt to specify necessary and sufficient conditions for the truth of propositions. Again, many of these will accept an externalist or causal theory of *meaning* which makes the meaning of expressions largely an empirical question inaccessible to a priori analysis. Such views of meaning will either reject, or significantly reinterpret, the verifiability criterion of meaning that drove so many phenomenalists (see Meaning and verification).

3 Responses

It is impossible in this context to evaluate challenges to the phenomenalist's basic philosophical presuppositions. But is there any response that the phenomenalist might make to the argument from perceptual relativity? The key to such a response would seem to involve 'protecting' the antecedents of the subjunctive conditionals employed by the phenomenalist. That something round is before me now entails only that if I were to seem to reach out and grasp the object *under certain conditions*, I would seem to feel something round. The phenomenalist's critics claim that one cannot specify the relevant conditions without introducing reference to the physical world, thereby defeating the whole purpose of the analysis. But is that true? A phenomenalist might argue that one can introduce into one's phenomenalistic analysis a clause about normal or standard conditions whose purpose is to *denote* those conditions (*whatever* they are) that normally (defined statistically) accompany certain sequences of sensations. The normal conditions clause might include reference to other facts about what sensations would follow others, facts about 'things-in-themselves' (construed as entities whose intrinsic nature will always remain a complete mystery), facts about the intentions of a God and so on. While the introduction of such a clause would move one away from 'pure' versions of phenomenalism by allowing into one's analysis expressions that might denote things other than minds and sensations, it might be argued that the modification is epistemically harmless, for we are always justified in believing, other things being equal, that conditions are normal, that is to say that conditions are as they usually are.

Once one modifies the analysis this much, however, it is not altogether clear why one should not move all the way to a version of what might be called a causal theory of objects, one that resembles classical phenomenalism much more than representative realism. On this 'phenomenalistic' causal theory, to assert the existence of a physical object is simply to assert the existence of a thing (whatever its intrinsic character might be) that has the power to produce certain sensations and that would produce certain patterns of sensations following an initial sequence of sensations *when conditions are normal*. This 'causal' theory looks a great deal like phenomenalism - indeed it may be another natural way of construing Mill's reference to physical objects as the permanent possibilities of sensations. Unlike traditional phenomenalism, however, this theory might have an easier time analysing physical-object statements which assert only the existence of something (somewhere, sometime) having certain physical characteristics. Such statements are a real problem for traditional phenomenalism, for when the physical-object statement fails to describe a physical object in relation to potential perceivers of those objects, it is not clear whose sensations we can plausibly refer to in our subjunctive conditionals. Notice, however, that the kind of causal theory sketched above faces identical problems to classical phenomenalism when it comes to specifying *subjunctively* the relevant powers to produce sensations. If this is right, there may not be as huge a gap as was historically supposed between phenomenalism and at least some causal theories of the physical world.

(1865) *An Examination of Sir William Hamilton's Philosophy*, London: Longmans, Green, 1889.(Mill's identification of physical objects with the permanent possibility of sensations and his explication of what he means using subjunctive conditionals describing sensations makes him a good candidate for one of the earliest phenomenalists.)

Phenomenological movement

The phenomenological movement is a century-old international movement in philosophy that has penetrated most of the cultural disciplines, especially psychiatry and sociology. It began in Germany with the early work of Edmund Husserl, and spread to the rest of Europe, the Americas and Asia. In contrast with a school, a movement does not have a body of doctrine to which all participants agree; rather, there is a broad approach that tends to be shared. The phenomenological approach has at least four components.

First, phenomenologists tend to oppose naturalism. Naturalism includes behaviourism in psychology and positivism in social sciences and philosophy, and is a worldview based on the methods of the natural sciences. In contrast, phenomenologists tend to focus on the socio-historical or cultural lifeworld and to oppose all kinds of reductionism. Second, they tend to oppose speculative thinking and preoccupation with language, urging instead knowledge based on 'intuiting' or the 'seeing' of the matters themselves that thought is about. Third, they urge a technique of reflecting on processes within conscious life (or human existence) that emphasizes how such processes are directed at (or 'intentive to') objects and, correlatively, upon these objects as they present themselves or, in other words, as they are intended to. And fourth, phenomenologists tend to use analysis or explication as well as the seeing of the matters reflected upon to produce descriptions or interpretations both in particular and in universal or 'eidetic' terms. In addition, phenomenologists also tend to debate the feasibility of Husserl's procedure of transcendental epoché *or 'bracketing' and the project of transcendental first philosophy it serves, most phenomenology not being transcendental.*

Beyond these widely shared components of method, phenomenologists tend to belong to one or another of four intercommunicating and sometimes overlapping tendencies. These tendencies are 'realistic phenomenology', which emphasizes the seeing and describing of universal essences; 'constitutive phenomenology', which emphasizes accounting for objects in terms of the consciousness of them; 'existential phenomenology', which emphasizes aspects of human existence within the world; and 'hermeneutical phenomenology', which emphasizes the role of interpretation in all spheres of life. All tendencies go back to the early work of Husserl, but the existential and hermeneutical tendencies are also deeply influenced by the early work of Martin Heidegger. Other leading figures are Nicolai Hartmann, Roman Ingarden, Adolf Reinach and Max Scheler in realistic phenomenology, Dorion Cairns, Aron Gurwitsch and Alfred Schutz in constitutive phenomenology, Hannah Arendt, Jean-Paul Sartre, Maurice Merleau-Ponty, and Simone de Beauvoir in existential phenomenology, and Hans-Georg Gadamer and Paul Ricoeur in hermeneutical phenomenology.

1 Matrix and origins

Phenomenology began in the reflections of Edmund Husserl during the mid-1890s, but some find forerunners as far back as Plato and Aristotle. There are immediate anticipations in the work of four figures, not all of whom influenced all phenomenologists. In *Essai sur les données immediates de la conscience (Time and Free Will)* (1889), Henri Bergson offered a concrete and qualitative description of conscious life with an emphasis on how it flows and how abiding geometrized objects are constructed. He did not influence Husserl, but sits in the background for Roman Ingarden, KitarōNishida and French phenomenology. In *Psychologie vom empirischen Standpunkt (Psychology from an Empirical Standpoint)* (1874), Husserl's teacher Franz Brentano urged the priority of a descriptive over an explanatory psychology of psychical phenomena, which he distinguished from physical phenomena by their *Intentionalität* (intentionality) or directedness at immanent contents. Husserl eventually opposed his teacher's immanentism, denying that physical objects have an 'inexistence' in intentional acts; developed a richer classification of mental phenomena; and came to call his work phenomenology rather than descriptive psychology.

Wilhelm Dilthey similarly called for a descriptive psychology, held that it would be fundamental among the human sciences (*Geisteswissenschaften*), and described the construction of the historical world in such sciences. Husserl's interest in these matters took some time to be recognized; the debt Martin Heidegger owed to Dilthey has been more easily appreciated. Finally, in *Principles of Psychology* (1890) William James was also concerned to describe what he called the stream of thought, including believing and willing, and his distinction between 'the object of thought' and 'the topic of thought' resembles that between 'the object as it is intended' and 'the object

that is intended'. James was read by Husserl and some later phenomenologists.

After studying mathematics and astronomy at Leipzig, pursuing mathematics at Berlin, and hearing Brentano lecture at Vienna, Husserl took his doctorate in mathematics at Vienna under Leo Königsberger. He then habilitated under Brentano's disciple Carl Stumpf at Halle in 1887 and taught there as *Privatdozent* until 1901, when he became an Extraordinarius at Göttingen. He became Ordinarius at Freiburg in 1916, retired in 1928 and died in 1938.

Husserl's Berlin teacher in mathematics, Carl Weierstraß, encouraged the quest for absolutely secure foundations within mathematics, but Husserl went beyond mathematics to seek grounds for all the sciences. His first work, *Philosophie der Arithmetik* (1891), attempted to account for the concept of number by relating it, in the manner of Brentano's psychology, to the mental operation of counting. This work in descriptive psychology was soon contested by Gottlob Frege as being psychologistic - psychologism being the doctrine, prominently defended by John Stuart Mill and his followers in Germany, that empirical psychology is the fundamental philosophical discipline and that because concepts and propositions are mental contents, logic is a branch of psychology and logical laws are empirical psychological laws. The myth later arose that Frege helped Husserl overcome his psychologism, but close study by J.N. Mohanty, Karl Schuhmann and others of correspondence and minor writings has shown that Husserl took this step in 1894 for other reasons.

Early in his second major work, *Logische Untersuchungen (Logical Investigations)* (1900-1) - the work that actually launched the phenomenological movement - Husserl contended that logic is not fundamentally an art based on the facts of mental life, but instead fundamentally contains 'pure logic' as a theoretical science of ideal logical forms that are not themselves parts of conscious life. Later in this work he then reflected on the correlative psychical processes in which logical forms are intended, provoking accusations of a relapse into psychologism from those for whom any reference to conscious processes is anathema. What Husserl's less extreme anti-psychologism forbade was in fact the reduction of logical structures to real intentional processes.

The key doctrine in the latter part of the *Investigations* proposes that just as there can be fulfilment of empty intentions of sensuous objects, for example, when we see or hear the same matters as had merely been conceived of previously, there can also be fulfilment of empty categorial intentions by categorial intuition, that is, a non-sensuous seeing of how predication takes form. Propositional truth is accomplished when a formerly empty predicative judgment is brought into coincidence with a predicatively formed state of affairs. Husserl could then call for a return '*zu den Sachen selbst*', best rendered as 'to the matters themselves', that is to say, a return from the blind manipulation of symbols to an insightful approach to the corresponding states of affairs, which include the matters themselves of concern to formal logic. This injunction was soon generalized beyond the theory of logic, formal ontology and the theory of parts and wholes to regions of all sorts; the phenomenological movement then ensued.

The four successively emerging, intercommunicating and sometimes overlapping tendencies within the phenomenological movement thus far all stem from the so-called 'descriptive' phenomenology of the first edition of the *Logical Investigations*.

2 Realistic phenomenology

Immediately after the publication of the *Logical Investigations*, Johannes Daubert persuaded a group of fellow students of Theodore Lipps at Munich to abandon Lipps' psychologism and accept the *Logical Investigations* as their philosophical bible. Many of these students, including Adolf Reinach, soon went to Husserl at Göttingen. The phrase 'phenomenological movement' first arose in this group, and realistic phenomenology became a distinct tendency within it only when Husserl developed the so-called 'transcendental turn' that its members did not accept. Daubert published nothing in his lifetime. Alexander Pfänder's *Phänomenologie des Wollens (Phenomenology of Willing and Motivation)* (1900) is retrospectively seen as the earliest major document of realistic phenomenology, and he and Reinach, as well as Max Scheler and Moritz Geiger, led the first generation of realistic phenomenologists. In 1913, together with Husserl, they began editing the *Jahrbuch für Philosophie und phänomenologische Forschung*, the quasi-official organ of the movement. The second generation includes Theodor Celms, Hedwig Conrad-Martius, Dietrich von Hildebrand, Roman Ingarden, Aurel Kolnai, Edith Stein and Kurt Stavenhagen.

In order to gain a systematic body of a priori knowledge on a wide range of matters, this first tendency emphasizes Husserl's eidetic method. Eidetic method involves suspending belief in any actual facts with which one begins, feigning variations of the matter at issue, and then grasping the invariant or universal essence that the facts, fantasies and any 'thought experiments' exemplify or instantiate. Since there is always already a vague and tacit acquaintance with essences, eidetic method is a procedure of clarification and description: a method of discovery, not invention. Terms and relations of possibility, compossibility, necessity and contingency by virtue of which facts are intelligible are thus disclosed. Husserl importantly distinguished formalizing universalization, which yields formal ontology, from generalizing universalization, which yields taxonomies. Mistakes in employing this method - its use in accounting for itself included - can be made, but are also in principle discoverable and corrigible by means of it.

The realistic phenomenologists maintained a metaphysical realism of universals and particulars. Geiger contributed to aesthetics and the a priori foundations of geometry. In *Der Formalismus in der Ethik und die materiale Wertethik (Formalism in Ethics and Non-Formal Ethics of Values)* (1913, 1916) Scheler objected to Kant's ethical formalism and advocated a value-realism in ethics. Reinach analysed accusing, commanding, promising, questioning and other social speech acts in 'Die apriorischen Grundlagen des bürgerlichen Rechts' ('The Apriori Foundation of the Civil Law') (1913), thereby contributing to the philosophy of law as well as the human sciences. Conrad-Martius and Stavenhagen contributed to the philosophy of religion, and Stein is now recognized not only for reflections on empathy and the human sciences, but also, through lectures from around 1930 collected posthumously under the title *Die Frau* (1959), for contributions to feminism. Hartmann showed the influence of Husserl and Scheler in his rejection of Neo-Kantianism and his central reliance on eidetic method in *Grundzüge einer Metaphysik der Erkenntnis (Outline of a Metaphysics of Knowledge)* (1921) and *Ethik* (1925). Ingarden, chiefly known for *Das literarische Kunstwerk (The Literary Work of Art)* (1931), carried realistic phenomenology to Poland. Gustav Shpet introduced phenomenology into Russia.

Herbert Spiegelberg, a student of Pfänder, later wrote the monumental *The Phenomenological Movement* (1960) as well as descriptively oriented studies; more recently, Karl Schuhmann has functioned as the historian of realistic phenomenology. Barry Smith and David Woodruff Smith lead the efforts to connect current Anglo-American analytical philosophy not only with Brentano and related Austrian philosophy, but also with realistic phenomenology.

3 Constitutive phenomenology

The founding text of constitutive phenomenology is the first book of Husserl's *Ideen zu einer reinen Phänomenologie und phänomenologischen Philosophie (Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy)* (1913). Posthumous works have made it clear that Husserl's transcendental constitutive phenomenology began by 1906 and is broader than the books published in his lifetime seem to show. Even during his lifetime he recognized in 'Nachwort zu meinen *Ideen*… ' ('Author's Preface to the English edition of *Ideas*… ') (1930) a 'constitutive phenomenology of the natural attitude', also called a 'mundane' or 'worldly' phenomenology, that amounts chiefly to phenomenological psychology. Much in the realistic, existential and hermeneutical tendencies can be seen as convergent with this mundane constitutive phenomenology. Nevertheless, the aim of most constitutive phenomenology is transcendental.

Constitutive phenomenology emphasizes processes within conscious life as they are intentive of objects, but it also reflects correlatively on the objects as intended in such processes. Constitutive phenomenology is specified by its concern with constitution. To analyse the 'constitution' of a matter is definitely not to distinguish the components of which it is composed, but rather to describe the syntheses of intentive processes in conscious life with which it correlates as an intentional object. The expression was taken from Kantianism, but is not confined to operations of conceptually structuring objects. There is pre-predicative experience in which objects are constituted as perceived, valued, willed and so on, but not yet formed into states of affairs.

Between *Logical Investigations* and *Ideas I*, Husserl published 'Philosophie als strenge Wissenschaft' (1911). It shows how his concern had broadened from the formal sciences of logic and mathematics to include the natural as well as the human or cultural sciences. Thus what he seeks in *Ideas I* are subjective conditions for the possibility of science of all kinds. His transcendentalism, however, differs from those of Kant and others in so far as he holds that the conscious life in which the world and worldly sciences could be subjectively grounded is itself the object

of reflective observation, eidetic intuition and description.

The opening part of *Ideas I* is devoted to eidetic method. It has unfortunately led to confusion between the eidetic and the transcendental methods, between going from 'facts' to 'essences' and going from conscious life in the world to conscious life as transcendental. Conscious life in its non-worldly or transcendental status is the same life that is originally encountered in the 'natural' or naively world-accepting attitude of the zoological and cultural sciences as well as in everyday life; but if the world is not to be grounded in part of itself, part of this worldly or natural (and realistic) attitude needs to be reduced to a transcendentally reflective attitude, and the conscious life, then reflectively thematized, needs to have its 'being in the world' placed in suspense. This is accomplished through transcendental phenomenological bracketing or *epoché*, a species of suspended judgment focused on the spatial, temporal and causal relations of conscious life with the rest of the world. In this attitude the world can be seen as an object intended to by non-worldly conscious life that, in the technical signification of the word, 'constitutes' it. 'Constitution' refers to the ways in which types of objects correlate with types of conscious processes. Husserl went on then to assert that conscious life has a more fundamental being than its being in the world, which not even all other transcendental phenomenologists accept.

In its middle parts *Ideas I* describes the natural attitude and transcendental *epoché*, offering detailed analyses of the parallel structures of the 'noema' or object as it is intended to and the 'noesis' or intentive conscious process in which objects are constituted. It also discusses how conscious life has an inner time in which each conscious process is 'protentive' to later and 'retrotentive' to earlier processes; how there is an 'I' who can engage in the processes strictly called acts; how sensuous 'stuff' is formed in perception; and how objects have characteristics as believed in, valued and willed, as well as modes of appearance and manners of givenness, including clarity and distinctness in recollection and imagination as well as in perception and 'eideation'.

The last part of *Ideas I* is devoted to rational justification. The theory of reason is the culmination of transcendental phenomenology. Justification for Husserl comes from the seeing, intuiting or 'evidencing' of the matters themselves. There is adequate and inadequate evidence, and apodictic and assertoric evidence, and such can directly and indirectly justify not only believing, but also valuing and willing; there is then epistemological, axiological and practical reason.

The second book of Husserl's *Ideas*, chiefly composed in 1912-15 and devoted to the natural and human sciences, was also worked on by his assistants Edith Stein and Ludwig Landgrebe; although it was not published until 1952, it was known in manuscript to Martin Heidegger before *Sein und Zeit (Being and Time)* (1927) and to Maurice Merleau-Ponty before *Phénoménologie de la perception (Phenomenology of Perception)* (1945). Husserl returned to the formal sciences in *Formale und transzendentale Logik (Formal and Transcendental Logic)* (1929).

At Freiburg during the 1920s and in retirement until his death in 1938, Husserl went beyond the 'static phenomenology' that uses eidetic method to disclose types of possible objects and consciousness. 'Genetic phenomenology', as he termed it, seeks to elucidate how active syntheses have origins in passive syntheses, a search that emphasizes time in individual life but also extends into history, intersubjectivity, the genesis of the lifeworld, and the teleology of conscious life in what he more broadly calls 'generative phenomenology'. These are all central issues in the later Husserl and in the background of his last work, *Die Krisis der europäischen Wissenschaften und die transzendentale Phänomenologie (The Crisis of European Sciences and Transcendental Phenomenology)* (1936).

Husserl's thought was eclipsed in Germany during the Nazi period, but continued to be developed after the Second World War by a number of figures, three of whom can be mentioned. First, in *Théorie du champ de la conscience (The Field of Consciousness)* (1957), Aron Gurwitsch draws upon Gestalt psychology to revise Husserl's accounts of the 'I' and attention, denying the need for the former as organizer and asserting the inherent organization of the field of consciousness into theme, thematic field, and margin. Second, in *Collected Papers* (1962-96), Alfred Schutz reflects from the standpoint of the 'constitutive phenomenology of the natural attitude' on the everyday common-sense constitution of the socio-cultural lifeworld and on how the cultural sciences - economics and sociology in particular - can know aspects of it. And, third, in *Zur Kritik der hermeneutischen Vernunft (The Critique of Hermeneutical Reason)* (1972), Thomas Seebohm returns to the traditional methodical hermeneutics as interpretation and critique of texts and traces that was pursued in Friedrich Schleiermacher, Augustus Boeckh and Wilhelm Dilthey, and seeks a transcendental phenomenological grounding for it.

It has been easy on the basis of the publications of his lifetime to caricature the mature Husserl as a modern-day (but nonrepresentationalist) Cartesian for whom disembodied and situationless intellects reflect upon the forms of their own thinking and have great difficulties knowing and interacting with one another. Closer study shows, however, that places for philosophy of the cultural as well as the natural sciences, for value theory and ethics, and for embodiment, empathy and communal life are sketched in those very same publications, although only developed in lectures and manuscripts, many of which have been published posthumously in *Husserliana* (see Phenomenology, epistemic issues in).

4 Existential phenomenology

Existential phenomenology is not structured by the complex concern for reason and the theory of science so prominent in constitutive phenomenology. Existential phenomenology draws ultimately upon the mundane reflective-descriptive spirit of the *Logical Investigations* as well upon the intensified interest in the 1920s and 1930s in Nietzsche and Kierkegaard, the latter urging a new signification for the word ‘existence’. The immediate occasion, however, is a misconstrual of Martin Heidegger’s *Being and Time*. This incomplete masterpiece is actually not devoted to human existence but rather ‘fundamental ontology’.

The old word ‘ontology’ had been revived by Husserl to name eidetic accounts of objects and their regions; realistic phenomenologists continue that usage, and Husserl investigates the regional ontologies of nature, body, psyche and culture in *Ideas II*. Attempting to radicalize constitutive phenomenology, Heidegger’s work is ‘ontology’ because it explicates the Being of beings (*Sein der Seienden*) and ‘fundamental’ because it seeks grounds beyond the mundane regional ontologies recognized by Husserl. The work contains an ‘existential analytic’ of human being or ‘Dasein’, not for a philosophical anthropology but as a means to this fundamental ontology.

Dasein - also translated as ‘existence’ or, in the early French translations of Henri Corbin, *réalité humaine* - is the being where the world is disclosed and the being whose mode of being is to understand Being, to bring it and related matters to light through seeing rather than constructing, and to find words for such matters. Dasein, Heidegger says, is being-in-the-world. This is not the world referred to in the positive sciences that Husserl emphasized even in *Die Krisis*, but rather the world as a set of everyday concerns and purposes, the world in which equipment is used and talk goes on. Dasein finds itself thrown into a situation not of its choosing; it is concerned with the future; it is for the most part distracted; and, deep down, it is anxious before its most extreme possibility - its own nothingness. But Dasein can heed the call of its own inmost possibility to live authentically and resolutely. Such terms were also used by Heidegger to support National Socialism during the 1930s, but they disappeared from his writing after the war, when he completed his turning (*Kehre*) from the oblique approach through Dasein to the direct thinking of Being.

Being was always Heidegger’s central issue. The third division of Part I of *Sein und Zeit* was to have gone beyond Dasein to show how the meaning of Being is time, but that division was not written, which made it even easier to construe the analytic of Dasein as philosophical anthropology, a construal that Heidegger emphatically challenged in his *Brief über den ‘Humanismus’ (Letter on Humanism)* (1947).

Hannah Arendt was influenced by Karl Jaspers as well as Heidegger during the 1920s, and is thus arguably the first existential phenomenologist, even though her contributions to political theory and problems of ethnicity, such as *The Origins of Totalitarianism* (1951), only appeared after the war. It is also arguable that existential phenomenology appears in Japan with Miki Kiyoshi’s *Pasukaru niokeru Ningen no Kenkyu (A Study of Man in Pascal)* (1926) and Kuki Shuzou’s *Iki no Kouzou (The Structure of Iki)* (1930). Chiefly, however, the existential tendency developed in France during the 1930s. The early Emmanuel Levinas interpreted Husserl and Heidegger together and helped introduce phenomenology into France and overall has more in common with the existential than with the other tendencies. Gabriel Marcel reflected upon fidelity, having, hope, promising and so on; opposed intellectualism and ‘objectivity’; and emphasized the embodiment, finitude, sensuousness and situatedness of existence in the world. His chief interest, however, independently paralleling Heidegger, is in Being as the ground of existence. Like Arendt, Sartre and Beauvoir, Marcel was not a professional academic and often wrote for general audiences.

The background influences on phenomenology in France in the 1930s also included Scheler, the rediscovered early

and humanistic Marx, and especially Hegel as presented by Jean Wahl and Alexandre Kojéve, who both argued for extensive convergencies between the phenomenologies of Hegel and Husserl. The issues of finitude, freedom, history, negation and individual and group conflict became prominent for Beauvoir, Merleau-Ponty and Sartre, who led the classic period of French phenomenology.

Jean-Paul Sartre studied Husserl and began to write on the ego, imagination and emotion in the mid-1930s, soon also studying Scheler and Heidegger. His *L'être et le néant (Being and Nothingness)* appeared in 1943. Sartre's approach relies on reflection upon, and eidetic description of, types of intentionality and objects as they present themselves, and he produced concrete analyses of many matters, for instance, historicity, authenticity, situation and especially individual freedom, which, for him, is the source of meaning and value. Human reality is what it has chosen to be, for existence precedes essence. In later work Sartre's emphasis on freely choosing individuals declined, he became doubtful about phenomenology's ability to explain historical conditioning, and turned to the writings of Marx.

Maurice Merleau-Ponty did pursue an academic career and chiefly wrote for fellow academics. He found many insights in science - especially cultural or human science, psychology in particular - but, like other existential phenomenologists, he opposed objectification and categorization and emphasized the ambiguous, concrete, contingent and particular. Against the early Sartre, he considered human freedom to be limited by its situation. In his main work, *Phenomenology of Perception*, he was concerned not with pure consciousness, but rather with human existence as embodied perception (or behaviour) in the world, and with how what is perceived has, for subjects, inherent structures of the sort described in Gestalt psychology and Aron Gurwitsch's work (see Gestalt psychology). While the body can be objectified in science, it is originally lived as subjective, and art, language, the other, politics, sexuality, space and so on, are to be analysed in relation to it. Merleau-Ponty died having composed only part of his body-focused ontology.

Simone de Beauvoir, often too closely associated philosophically with Sartre, is the third leading French existential phenomenologist. She likens existential conversion, a suspending of will in order to grasp the conditions of one's life, to Husserl's transcendental *epoché*; appreciates Heidegger's concern with the future, but finds change rather than being-toward-death central; and accepts from Merleau-Ponty that the human body is historical, denying, however, that a woman is her reproductive or sex-object body. For her, phenomenology is centrally concerned with friendship, as her autobiography and letters show, and also with age, class, ethnicity, gender, oppression and liberation. Beauvoir inspired the second wave of feminism with *Le deuxième sexe (The Second Sex)* (1949), opposing the myth by which categories defined in contrast with male categories are imposed on women; analysing the lived experience of meaning in feminine being-in-the-world; and urging that females are not born but become women (see Feminism).

Existential phenomenology spread widely from France. It was also extended to the human sciences, beginning with work in The Netherlands and Flanders during the 1950s, and has been represented in the United States by Maurice Natanson and in a structural version by Bernhard Waldenfels in Germany. It was eventually eclipsed by structuralism in France, but became central to the vast expansion of phenomenology in the United States that began in the 1960s - where the relevance of existential phenomenology for new problematics, such as feminism, is increasingly recognized (see Existentialism; Existentialist ethics; Existentialist theology).

5 Hermeneutical phenomenology

According to the *Logical Investigations*, perception, recollection, imagination and so on have a sense or meaning prior to expressions in propositional form, and some consider this insight an anticipation of hermeneutical phenomenology. This fourth tendency also begins - and without the 'existential' interpretation - in Heidegger's *Being and Time*. Traditional hermeneutics was chiefly interpretation of texts, but now all experience is seen as being affected by language and interpretation. Heidegger interprets 'phenomenology' as the *logos* of the *phainomenon*, these words being construed, respectively, as what makes matters manifest and what is made manifest, the latter including undisclosed as well as disclosed aspects. The phenomena of authenticity, death, care and above all Being itself are thus interpretable. Dasein always already has some understanding of Being that can be refined through philosophical interpretation, although the truth thus won conceals as well as reveals. The analysis of Dasein that so influenced existential phenomenology is actually a hermeneutics of Dasein that seeks to bring out hidden aspects. This includes self-interpretations, which refer back to earlier generations and are thus

historical. The hermeneutical approach, especially to texts, continues in Heidegger's later work, although the word hermeneutics does not.

The first phenomenological interpretation beyond Heidegger is Hans-Georg Gadamer's *Platons dialektische Ethik (Plato's Dialectical Ethics)* (1931) (see Gadamer, H.-G.). It accepts Heidegger's notion of revealing and concealing truth as well as his focus on the active participant in life rather than the scientific observer. Its emphasis on the ethical aspects of the openness of one interlocutor to another is continued in his quite influential *Wahrheit und Methode (Truth and Method)* (1960). Not exclusively focused on texts, this is a 'philosophical hermeneutics' that is concerned with the general theory of understanding, that defends tradition and authority against Enlightenment attacks, and that is urged for use in law, literature and theology. It remains phenomenological in its use of Husserl's notion of intentionality and theory of perception to oppose naturalism and relativism. Interpretations even of the unthought in a text seek to be fulfilled by the matters themselves referred to by the text.

Paul Ricoeur studied Marcel and Jaspers as well as Husserl and Heidegger while interned as a prisoner of war. In 1950 he published the translation of Husserl's *Ideen I*, which he began in the camp; he subsequently played a central role in advancing French Husserl scholarship and regularly contended that his own evolving position was compatible with Husserl's original inspiration, whereby meaning is transcendent of conscious life. The first expression of his own thought converged with realistic phenomenology in employing eidetic method to analyse the voluntary and involuntary (he had also studied Pfänder's work). His concerns then with freedom, the other and evil converged with existential phenomenology, and, finally, he has focused on understanding as requiring texts or text-like structures and he thus joined hermeneutical phenomenology. He interprets not only religious symbols, for example, of the creation, but also the unconscious of psychoanalysis in works such as *Le conflit des interpretations (The Conflict of Interpretations)* (1969a). More recent work interprets metaphor, time, narrative, the 'same' or 'self' and the other.

Gadamer and Ricoeur have promoted hermeneutical phenomenology quite actively and this tendency has been strong in the United States. Calvin O. Schrag has contributed to the philosophy of language in *Experience and Being* (1969), Don Ihde to the philosophy of technology in *Technics and Praxis* (1979), Graeme Nicholson to the philosophy of perception in *Seeing and Reading* (1984), and then there is Patrick Heelan's *Space-Perception and the Philosophy of Science* (1983) and Joseph J. Kockelmans' *Ideas for a Hermeneutic Phenomenology of Natural Science* (1993). Other philosophical work has been done in aesthetics, ethics, history, language, law, literature, politics and religion. Hermeneutical phenomenology has extensively influenced not only the philosophy of the human sciences but the human sciences themselves.

Lest the debates within the movement and the structure of this essay give the impression that phenomenology went off in four separate ways, it must be emphasized that hermeneutical phenomenology draws nearly as much on existential and constitutive phenomenology as on the early Heidegger; that, while highly original, existential phenomenology is conscious of its central inspiration in Husserl and Scheler as well as Heidegger; that there has been from the outset extensive mutual borrowing as well as criticism between constitutive and realistic phenomenology; and that, by virtue of his effort reflectively to analyse and describe the matters themselves of conscious life and what is, in manifold ways, intended in it, Husserl is, as Ricoeur has said, not the whole of phenomenology, but he is 'more or less its centre' (see Hermeneutics).

6 Prospects

The phenomenological movement began with Husserl's *Logical Investigations*. History has shown that Wilhelm Dilthey was correct to proclaim this work 'epochal'. Besides the tendencies sketched above, a shifting geographical focus can be noted. This focus was in Germany until 1933, then shifted to France until about 1960; after that, while inspiration came from both Germany and France, the largest part of phenomenologists have come from the United States. Other enduring national traditions of phenomenology began in Japan, Russia and Spain before the First World War; arose in Australia, Czechoslovakia, Hungary, Italy, Korea, The Netherlands and Flanders, Poland and Yugoslavia, as well as the United States and France between the wars; and emerged after the Second World War in Canada, China, Great Britain, India, Portugal, Scandinavia and South Africa. By the 1980s, genuinely international (and not just transatlantic) conferences and other forms of collaboration were intensifying; now that generations-deep underground tendencies have begun surfacing after the end of the Cold War, it is all the

more likely that this trend will continue. It may turn out that the German, French and American periods of the phenomenological movement began to be succeeded in the early 1990s by an international period in which there are many centres.

As a century-old, world-wide, still growing and increasingly multidisciplinary movement, phenomenology is arguably the central movement in twentieth-century philosophy, and its vitality and momentum should carry it far into the twenty-first century.

Phenomenology in Latin America

The Latin American struggle against the positivism of the nineteenth century was the primordial endeavour of the founders of Latin American thought, such as José Enrique Rodó (1872-1917), José Vasconcelos (1882-1959), Alejandro Korn (1860-1936), Carlos Vaz Ferreira (1871-1958), Alejandro Deústua (1849-1945), Enrique Molina (1871-1956) and Antonio Caso (1883-1946). These thinkers fought to win their philosophical freedom in a battle against continuing such European currents as Neo-Kantianism and the existential-phenomenological movement, on the one hand and on the other, developing a philosophy that was purely Latin American.

In all of this the influence of the Spanish philosopher José Ortega y Gasset (1883-1955) was fundamental. Ortega y Gasset was mainly interested in the problems of history and culture. His famous apothegm, 'I am myself and my circumstance' (1947: 322), was the justification for a phenomenological movement axiological in nature, as well as being the point of departure for the affirmation of Latin American circumstance.

Few have cultivated the Husserlian style of phenomenology in Latin America outside the classroom. Latin American thinkers have preferred to apply the phenomenological method to the different fields of knowledge. In particular, those dealing with sociocultural aspects, literary criticism, socio-economic structures and juridical axiology. In all works related to axiology the thought of the philosophers Nicolai Hartmann (1882-1950) and Max Scheler (1874-1928) were enormously influential.

Many of those originally inclined towards phenomenology drifted from the 1970s onwards, towards analytic philosophy, philosophy of science and logical neopositivism.

1 Phenomenology and literature

Theoretical Latin American writers in the field of literary criticism are interested especially in the ontology of the literary work. This interest, which includes the task of discovering and/or constructing Latin American subjectivity and identity in relation to their specific and differing surroundings, focuses on the basic principles of phenomenological epistemology. They base their own epistemology on the epistemological thinking of early Husserl. This phase of the philosophy of Husserl (§3), also known as neorealism, states that reality can be grasped in the essences as revealed in consciousness.

Particularly important is the application to literature of the Husserlian formula the mutual implication of subject and object and his notion of transcendental subjectivity. Graciela Maturo (1928-), for example, uses these ideas to achieve her goal of explaining (and to construct by explanation) the peculiarity of Latin American subjectivity. This critical approach to Latin American literature is justified because, as in other countries, especially France, Spain, Germany and Italy, the literary work of art is used to reveal aesthetic, ethical or metaphysical philosophical intuitions and preoccupations. Maturo makes this point in her writings and the phenomenological method helps her to describe the literary phenomenon on a particularly interesting continent. In doing so, she joins other writers and thinkers who have tried to accomplish the construction of a Latin American identity, which is separate from, although influenced by Europe (see Marginality; Cultural identity).

2 Relevant thinkers: Argentina

Carlos Astrada (1894-1970) was professor at the University of La Plata and Buenos Aires. His background was in Neo-Kantianism under the teachings of Scheler, Husserl and Heidegger in Freiburg (see Neo-Kantianism). He first oriented his work towards existential phenomenology (1936), but later returned to Kant and moved on to Marx, then Hegel (1967). Astrada interpreted authentic existential freedom more as social liberty than as individual freedom. He contributed interesting works in the area of phenomenology.

Arturo Cambours Ocampo applied the phenomenological method to literary creation in his book, *Lenguaje y creación: notas para una fenomenología del estilo literario (Language and Creation: Notes Towards a Phenomenology of Literary Style)* (1970). He showed the usefulness of the phenomenological method for studying the language of literature in *Literatura y estilo: notas para una estética del escritor y su experiencia fenomenólogica (Literature and Style: Notes Towards an Aesthetic of the Writer and their Phenomenological Experience)* (1985). His aim was to establish the aesthetics upon which the literary style is founded.

Raúl Castagnino is a literary critic with a phenomenological orientation. He is a member of the phenomenological movement which is literary in nature and has many followers in Latin America and elsewhere. He became known especially for *El análisis literario: introducción metodológica a una estilística integral (Literary Analysis: Methodological introduction to an Integral Stylistics)* (1953).

Carlos Cossio (1903-) was mostly preoccupied with the philosophy of law. He managed to achieve an original synthesis between phenomenology and existentialism, asserting that the object of law is human behaviour: the norms of behaviour were not themselves laws.

Juan Luis Guerrero (1899-1957) forged his academic career as professor of ethics at the University of Buenos Aires and of aesthetics at the University of La Plata. Influenced by Max Scheler, Guerrero's conception was centred around the gnoseological aspect of individual subjectivity, on the ethics of the human personality and on aesthetics.

J.A. Madile's primary interest was the phenomenologcial nature of the epistemological problem. The influence of Nicolai Hartmann is clearly evident in his work.

Graciela Maturo (1928-) followed a current of thought which was also intensively cultivated in Europe to apply her phenomenologcial knowledge and reflections in the field of literature. She considered phenomenology the best methodology and the most appropriate approach to unravel the elements characteristic of Latin American literature and literary criticism, as she states in *Fenomenología, creación y crítica: sujeto y mundo en la novela latinoamericana (Phenomenology, Creation, and Criticism: Subject and World in the Latin American novel)* (1989). She also discusses the interaction of Latin American versus European identities. In *Imagen y expresión: hermeneútica y teoría literaria desde America Latina (Image and Expression: Hermeneutics and Literary Theory from Latin America)* (1991), several authors contribute to the influence of phenomenological-existentialist hermeneutics, principally cultivated in France.

3 Relevant thinkers: Brazil

Creso Coimbra was interested in Latin American identity. He applied phenomenology to the problems of culture in his work *Fenomenología da cultura brasileira (Phenomenology of Brazilian Culture)* (1972).

Julio Fragata was a follower of Husserl and attempted to establish a Husserlian phenomenology as the basis of all philosophical enterprise, as illustrated in *A fenomenologia de Husserl como fundamento da filosofia (The Phenomenology of Husserl as the Foundation of Philosophy)* (1959). Subsequently in *Problemas da fenomenologia do Husserl (Problems in the Phenomenology of Husserl)* (1962), he analysed the contrast between the early and later works of Husserl.

Alfredo Naffah Neto (1947-) witnessed both state terrorism and the work of the country's death squads. He successfully applied the phenomenological method to the historical situation of the last dictatorships of Brazil (1985).

4 Relevant thinkers: Colombia, Costa Rica, Chile

In Colombia Danilo Cruz Vélez was interested in the problems of the philosophy of culture and philosophical anthropology. The influence of Scheler and Heidegger were in evidence in his central thesis (1970) which focused on the concept of philosophy as a perpetual beginning, without any presuppositions.

In Costa Rica Helio Gallardo (1942-) was involved with the trend of searching for a philosophy deeply rooted in Latin American social problems. He implemented phenomenological analysis to understand those problems. On the occasion of the quincentenary of the encounter of cultures in the Americas, he wrote *500 años: fenomenología del mestizo: violencia y resistencia (500 Years: Phenomenology of the Mestizo: Violence and Resistance)* (1993).

In Chile Mario Ciudad was influenced by Henri-Louis Bergson, as was the entire first generation of the opponents of logical neopositivism. His work, *Bergson y Husserl: diversidad en la coincidencia (Bergson and Husserl: Diversity in Coincidence)* (1960) showed an interest in the phenomenology of Husserl and tried to find points of coincidence with the philosophy of life of Bergson.

5 Relevant thinkers: Mexico

Antonio Caso (1883-1946) became well known through a series of lectures in which he refuted the wave of positivism at that time. He introduced new philosophical currents, emphasizing the philosophy of Bergson and Husserl. The latter enabled him to broaden the idea of positivism. He worked on the development of his own thought inspired by his intuitions with respect to essence and existence. His distinctiveness derived from his pluralist concept of reality and his interpretation of philosophy as a kind of synthesis of reflections about nature and culture. For Caso, philosophy is an integratory superscience in which existence and thought are concordant.

Carmen Cecilia Hernández de Ragoña utilized phenomenological methods in *Fenomenología histórica de las religiones (Historical Phenomenology of Religions)* (1975) to analyse other fields, cultivating especially the phenomenology of religion.

Samuel Ramos (1897-1959), a disciple of Antonio Caso, was influenced by Ortega y Gasset and Scheler. He was concerned with humanity generally, starting with the Mexican (1934). He attempted the affirmation of freedom with personality by overcoming the conditioning imposed by the circumstances of civilization.

Arturo Rivas Saínz applied the phenomenological method to the poetic phenomenon with clarity, insight and a great command of metaphysical intuition (1950).

6 Relevant thinkers: Peru, Puerto Rico, Uruguay, Venezuela

Peruvian, Francisco Miró Quesada Cantuarias (1918-) wrote extensively in the areas of the phenomenology of logic and the philosophy of science (1941), both of which he deemed rigorous enough to resolve the problems of humankind. He never abandoned his preoccupation with humanity's problems in the ethical-political sphere. His compatriot José Tamayo Herrera was interested in mythopoetic activity - the ability to create myths. His ideas feature in *Fenomenología de la creación poética (Phenomenology of the Poetic Creation)* (1963).

In Puerto Rico, Charles Rosario, with a focus on poetry and philosophy, applied his knowledge of phenomenological philosophy to contemporary Puerto Rican society (1965). From 1898 there was a convergence of two contrasting points of view which have remained unresolved. These are the Puerto Rican's identity with Spanish and Anglo-Saxon cultures, both of which are based on the economic and political power of the USA and the need to reaffirm a distinct Puerto Rican cultural identity through literature and thought. Rosario uses the phenomenological method which describes the social, moral, literary and other phenomena to explain the traumatic change from an agricultural society to an industrial one. The change produced a crisis for Puerto Ricans in the perception of their own identity, especially in comparison with other Latin American countries.

In Uruguay Homero Altesor in his book, *Fenomenología del cuerpo: anatomía filosófica (Phenomenology of the Body: Philosophical Anatomy)* (1986) applied phenomenology to the analysis of the different parts of the human body as a function of the total harmony of humankind.

Juan Llambías de Azevedo (1907-1972) based juridical axiology on the phenomenology of Scheler and Hartmann, as well as Husserl, to establish the reality of rights as an objective value independent from any subjective judgment. Llambías de Azevedo (1940) explained a prolix phenomenology of the acts of conscience that allow the constitution of the object of the law. The investigation of the essence of the object of the law drew him, after Nicolai Hartmann, towards identifying an aporetics of law. The most important aspect of this aporetic was the relationship between the content of law and values. In addition to any subjective dimension of the judgment of values Llambías de Azevedo rejected any relativism with respect to the subjective dimension of it. Following Scheler, he submits that the supreme value is the person, who is the ultimate foundation of the law and of the values of justice and equality.

In Venezuela Ernesto Mayz Vallenilla (1925-) wrote several works interpreting and expounding the works of Dilthey, Husserl and Heidegger (1956; 1960). His thesis was based on the conception of temporality which starts from nothingness. His thought is within the tradition of the propounding of Americanist thought. The main part of his work has compared and contrasted Heidegger and Marx.

Phenomenology of religion

The phenomenology of religion is a descriptive approach to the philosophy of religion. Instead of debating whether certain religious beliefs are true, it asks the question 'What is religion?' It seeks to deepen our understanding of the religious life by asking what (if anything) the phenomena we normally take to be religious have in common that distinguishes them from art, ethics, magic or science. Since the search for what is common presupposes difference and brings to light an astonishing array of divergent beliefs and practices, the quest for the essence of religion unfolds quite naturally into questions of typology 'What are the most illuminating ways of classifying religious differences?'

Sometimes the phenomenology of religion is motivated by a desire for quasi-scientific objectivity, combined with at least a soft scepticism about metaphysical speculation; if we cannot decisively resolve the metaphysical mysteries of life, people with this approach argue, at least we can give an unbiased description of those interpretations of the world we normally designate religious. At other times the phenomenology of religion has a more existential orientation: whether or not our arguments can settle questions about the ultimate shape of being, we have to choose our own mode of being-in-the-world; and if we are to decide intelligently whether or not to be religious, we need to be as clear as we can about what it means to be religious - ineluctable uncertainty may make faith something of a leap, but the leap need not be blind.

1 Descriptive philosophy of religion

Typically, the philosophy of religion is a normative enterprise, reflecting on the truth of religious beliefs. Thus proofs of the existence (and nature) of God are offered in the attempt to establish the truth of various theistic claims, while the existence of evil is offered as evidence against such claims. Both sides of this argument attempt to show that the other's arguments do not decisively establish the conclusion put forth, and the discussion often turns from the question of truth to the question of rationality. If God's existence cannot be decisively proved or disproved, is it rational to believe in God? But this, too, is a normative question.

By contrast, the phenomenology of religion brackets or temporarily sets aside such questions as to whether we are obliged or permitted or forbidden by the standards of truth and rationality to hold various religious beliefs. Instead, its point of departure is the fact that religion is an observable phenomenon of human life, and its task is to help us better understand what religion is by giving descriptive analyses of that aspect of human experience. In this regard it strongly resembles the philosophy of science and the philosophy of art, the tasks of which are neither to praise nor to bury science and art, but to give us deeper insight into the structures and functions of these widespread human activities. In all three cases, the observability of the phenomena is no guarantee of agreement when it comes to descriptive analysis.

By asking the question 'What is religion?', the phenomenology of religion expands the subject matter of the philosophy of religion in two ways. First, since religion is as much a matter of practice as of belief, it abandons the assumption that the philosophy of religion is primarily concerned with locating religious belief on some hierarchical scale of cognitive acts inspired by Plato's divided line. Instead, it focuses attention on religion as a language game that is a fully fledged form of life or mode of being-in-the-world.

Second, in seeking the essence, the common nature, or at least the family resemblances of a wide variety of phenomena usually taken to be religious, it requires a multicultural approach not usually found in the normative philosophy of religion, which often restricts itself to issues arising out of Jewish and Christian monotheism. Data for philosophical reflection emerge from work in comparative religion or the history of religions, such as Frazer's *The Golden Bough* or Eliade's *Patterns in Comparative Religion*.

As the search for the essence or common core of religion encounters divergences, numerous and often sharp, among religious beliefs and practices, a new task arises: typology. Now the question 'What is religion?' is supplemented by the question 'What differences among religious phenomena are most fundamental, and what kinds of classification are most illuminating?' It often turns out that historically distinct traditions, such as Judaism, Christianity, Islam, Hinduism, Buddhism, Daoism and so forth, can be replaced for such purposes by categories that cut across these traditions. Among these categories are Eliade's distinction of cosmos from history,

James' distinction of once-born from twice-born and Bergson's distinction of static/closed from dynamic/open (see Eliade, M. §2; Bergson, H.-L. §8.)

2 Scientific and existential phenomenology of religion

Historically speaking, the phenomenology of religion is a post-Kantian affair, and one strand has Kant himself and Husserl as its mentors. From Kant (§8) comes scepticism regarding metaphysical disputes about the way the world really is, along with the notion that we can nevertheless set forth the basic structures of our experience of the world. By making the phenomenal rather than the noumenal our subject matter, we can retain the goal of a philosophy that is scientific in the sense of giving us objective knowledge about something. Husserl's ideal of philosophy as rigorous science seeks to preserve this moment in Kant from lapsing into naturalism or psychologism. At the same time, his accounts of transcending the natural attitude by moving from fact to essence and by bracketing questions about the reality of the world as distinct from the mode of its givenness in experience (the *epoche*) seek to give methodological rigour to the descriptive tasks of postmetaphysical philosophy (see Husserl, E.).

A quite different motivation underlies the existential orientation in the phenomenology of religion. This strand presupposes both the hermeneutical and the existential turns phenomenology was to take away from Husserl's conception of a rigorously scientific philosophy; and it replaces Kant and Husserl with Heidegger and Kierkegaard as mentors for the phenomenology of religion. The hermeneutical critique, building on the late work of Husserl, becomes fully explicit in Heidegger (§§2-3) and Gadamer (§§3-4). All our cognitions are interpretations whose own possibility presupposes our immersion in language, in culture and in history in such ways that the ideal of a purely scientific understanding, free from all particular perspectives and presuppositions, is a chimera. No phenomenology can have as its goal the preservation of scientific objectivism in a postmetaphysical context.

What then can the goal be? It is at this point that Kierkegaard (§§4-6) is able to provide an existential answer. Not only does reflection always emerge from within the concrete situatedness of human existence; it has as its goal the clarification of the possibilities that confront us so that we can choose responsibly what kind of lives to live, especially since we must choose without the epistemic guarantees we would like.

As a descriptive approach to the philosophy of religion, the phenomenology of religion is more than just an alternative to the normative mode. It is always, at least implicitly, a critique of the latter. In its scientific mode, it extends the Kantian judgment that theoretical reason cannot settle metaphysical disputes to reason in all its modes, and views traditional philosophy of religion as engaging in speculation that is unwarranted because undecidable. While the existential mode often shares this view, its critique grows primarily out of its appreciation of Pascal's distinction between the God of the philosophers and the God of Abraham, Isaac and Jacob. It fears that the debates over natural theology too quickly become a theoretician's luxury in a realm of abstraction that loses touch both with the living God and with the concrete concerns and inescapable choices of existing individuals.

Both kinds of phenomenology of religion assume a kind of Socratic ignorance, a denial that we can attain final certainty about ultimate reality; and both place the Socratic question 'What is religion?' in this context. Sharing the Socratic preoccupation with the question about the way we should live, the existential mode transforms the objective question 'What is religion?' into the subjective question 'What would it mean to be religious as distinct from being irreligious?'

These two modes of phenomenology of religion are ideal types. Some important descriptions of the religious experience proceed with hardly a pause for methodological reflection; others proceed on the basis of historical, psychological, sociological or even literary self-understandings; still others, with clear philosophical intent, describe their project in ways that do not correspond exactly to these descriptions of the scientific and existential modes. But these tendencies can be perceived, in varying degrees, across a vast body of literature, all of which can be read as contributing to this philosophical project. We read descriptions of the religious life phenomenologically, whatever their genre, when we look for meanings (or essences) rather than facts; when we view these meanings as living, as what happens rather than what happened; and, if we move to the existential mode, when we consider these meanings as live options, as possibilities for our own existence.

3 The sacred

Phenomenology is a kind of empiricism; it addresses itself to the modes of our experience. But this does not keep it from making the world (the object of experience) its theme in various ways. Similarly, the phenomenology of religion is not compelled to focus on the subjective side of religion (for example, faith) as distinct from its objective side (for example, God). Indeed, if anything, the tendency has been to focus precisely on the ‘object’ of religious experience.

However, this is doubly problematic. First, the concept of God or gods is not appropriate for such religious ‘objects’ as the Buddha nature, which is at once the being of all things and *anatta*, no-self or no-substance; the *mana* of the Melanesians, and its many dynamistic correlates; or even the spirits of animistic religion. Second, even in contexts that speak freely about God, the claim is widespread that the highest experience of God or Brahman or the Buddha nature and so forth is beyond the structure of subject-object experience. Hence the quotation marks when speaking of the ‘object’ of religion.

The terms ‘sacred’ and ‘holy’ have come to serve as the generic names for the ‘object’ of religion. The ways in which these notions are spelled out provide the first answer to the question ‘What is religion?’ or ‘What is the common feature in virtue of which we call this very diverse set of phenomena religious?’ Two classic accounts highlight possibilities for both convergence and divergence.

Geerardus van der Leeuw gives a triadic structure to his classic work *Religion in Essence and Manifestation: A Study in Phenomenology* (1933): the object of religion, the subject of religion, and object and subject in their reciprocal operation. The object of religion, which he calls the sacred, is above all else power. But this power is not just any agency. Van der Leeuw stresses its remoteness. However frequently one encounters it, it never becomes usual or familiar, but remains a ‘*highly exceptional* and *extremely dangerous "Other"*’ ([1933] 1963 (1): 24). Accordingly, encounters with the sacred are accompanied by amazement, fear, and especially awe.

Van der Leeuw stresses that in its ‘primitive’ - that is, dynamistic and animistic - forms, this notion of sacred power lacks two features that often accompany it in the religions of the world’s ‘high’ civilizations. The first of these is a principle of unity in terms of which it is possible to think of the universe as an ordered and integrated cosmos. The second is a moral link between power and something like justice so that ‘the ground of the world may be trusted’ ([1933] 1963 (1): 31). In its generic sense, then, the sacred power ‘remains merely dynamic, and not in the slightest degree ethical or "spiritual"’ ([1933] 1963 (1): 28).

Rudolf Otto’s earlier study, *The Idea of the Holy* (1917), challenges this latter claim. Seeking to elaborate on what Schleiermacher (§7) called the feeling of absolute dependence, he defines the holy or the numinous as the *mysterium tremendum et fascinans* (overwhelming and fascinating mystery). To speak of the holy as mysterious is to focus explicitly on that in the ‘object’ of religion which is non-rational or ineffable in the sense of exceeding our conceptual apprehension. To call it the *mysterium tremendum* is to accentuate the awe-fulness of the holy, its ability to evoke fear and dread. This is the aspect of the sacred that allows it to be designated the ‘Wholly Other’. Finally, to describe it as *fascinans* is to find it to be ‘uniquely attractive and *fascinating*’ ([1917] 1958: 31). If the wrath of God is an expression of tremendousness, the mercy of God is an expression of the fascinating aspect of the holy. We are naturally ambivalent before the holy, drawn to it and repelled by it at the same time (see Otto, R.).

But for Otto, this complex ‘object’ of experience is not just a matter of power but also of value. Before the numinous I experience not only the limits of my power but also the limits of my worth. The notions of sin and defilement that emerge go beyond the notions of guilt and remorse derived from morality, just as holiness is not reducible to goodness; however, the value categories of religion are intimately related to those of morality. Over against van der Leeuw, Otto leaves us with two important and probably interrelated questions: Is the dialectical tension between attraction and repulsion generic to religion, or only a feature of some species? And is there an essential link between religion and morality, or is the supreme and unique value of the holy a specific rather than a generic feature of religion?

One approach to this latter question involves the sharp distinction between religion and magic. If the sacred is a matter of value-free power, then it entails no normative restraints against making it a means to human ends. The only barriers are technical, and the sacred power is on a par with atomic power: can we figure out safe and reliable procedures for putting this power at our own disposal? On Otto’s view that the holy is a category of value, we

should say at this point that we are no longer dealing with religion but with magic. On van der Leeuw’s view, by contrast, we should speak here of instrumental religion, recognizing that phenomena we normally designate as religious sometimes have this means-end structure constrained by no values but our own purposes.

Phenomenology, epistemic issues in

Phenomenology is not a unified doctrine. Its main proponents - Husserl, Heidegger, Sartre and Merleau-Ponty - interpret it differently. However, it is possible to present a broad characterization of what they share. Phenomenology is a method of philosophical investigation which results in a radical ontological revision of Cartesian Dualism. It has implications for epistemology: the claim is that, when the foundations of empirical knowledge in perception and action are properly characterized, traditional forms of scepticism and standard attempts to justify knowledge are undermined.

Phenomenological method purports to be descriptive and presuppositionless. First one adopts a reflective attitude towards one's experience of the world by putting aside assumptions about the world's existence and character. Second, one seeks to describe particular, concrete phenomena. Phenomena are not contents *of the mind; they all involve an experiencing subject and an experienced object. Phenomenological description aims to make explicit essential features implicit in the 'lived-world' - the world as we act in it prior to any theorizing about it. The phenomenological method reveals that practical knowledge is prior to propositional knowledge - knowing* that *arises from knowing* how.

The key thesis of phenomenology, drawn from Brentano, is that consciousness is intentional, that is, directed onto objects. Phenomenologists interpret this to mean that subjects and objects are essentially interrelated, a fact which any adequate account of subjects and objects must preserve. Phenomenological accounts of subjects emphasize action and the body; accounts of objects emphasize the significance they have for us.

The aim to be presuppositionless involves scrutinizing scientific and philosophical theories (Galileo, Locke and Kant are especially challenged). Phenomenology launches a radical critique of modern philosophy as overinfluenced by the findings of the natural sciences. In particular, epistemology has adopted from science its characterization of the basic data of experience.

The influence of phenomenology on the analytic tradition has been negligible. The influence on the Continental tradition has been greater. The phenomenological critique of modern science and philosophy has influenced postmodern thought which interprets the modernist worldview as having the status of master narrative rather than truth. Postmodern thought also criticizes the positive phenomenological claim that there are essential features of the lived-world.

1 Phenomenological reduction

The first phenomenological move is the phenomenological reduction, also called by Husserl 'bracketing' or 'the epoché'. The move involves distancing oneself from one's everyday 'immersion' in the ordinary practical activities of life, adopting a reflective standpoint upon one's experience of the world. This is taken to be the necessary standpoint from which to engage in genuine philosophical enquiry, one which phenomenologists criticize other philosophers for failing to adopt. The philosophical standpoint is radically different from the 'natural' attitude of common sense and of scientific enquiry. The crucial difference is that, in the natural attitude, one assumes unquestioningly that the world exists. The philosophical attitude, in contrast, puts aside - brackets - this assumption.

The philosophical standpoint after the reduction is differently characterized by transcendental phenomenology (Husserl) and existential phenomenology (Heidegger, Sartre, Merleau-Ponty) (see Phenomenological movement). Husserl believed that it was a 'transcendental' standpoint, 'outside' the natural world. Existential phenomenologists believed that such a standpoint is neither attainable nor necessary. The human standpoint is essentially *in* the world. The reduction is only partial: one cannot put aside all one's existential assumptions at the same time. However reflective, the philosopher still takes for granted the existence of the armchair.

This first phenomenological move can appear puzzling: What is this reflective standpoint? Why is it essential for philosophical investigation? How can one put aside one's belief that the world exists? It is important to note, however, that there are clear similarities between phenomenological reduction and certain familiar, traditional moves made in articulating scepticism about the external world. The sceptic, in challenging the claim that we can know that the external world exists, is clearly requiring us to suspend our everyday judgment that it does (see

Scepticism).

The point of the phenomenological reduction is to bring to our attention the realm of phenomena, the ‘lived-world’, the world as we experience it. What exactly are phenomena? What is normally wanted in response to this question is an account of how phenomena relate to objects in the external world: are they real features of these objects or are they merely features of experiencing subjects? It is important to see that this question is supposed to have been ruled out by the phenomenological reduction. We are no longer assuming that there *is* an external world. Of course, following the reduction, there still *appears* to be a world. One aim of phenomenology is to explore how the world appears with a view to finding the experiential basis for, and meaning of, our belief that the world exists independently of our experience of it. Phenomena are our experiences of the world; we must, at this stage, remain neutral concerning the ontological status of that ‘world’.

2 Presuppositionless description

The second phenomenological move is to describe phenomena without presuppositions. This is a difficult instruction to follow. Description normally has some purpose; what is the phenomenological purpose? One central phenomenological purpose is to expose and avoid certain philosophical presuppositions. One such presupposition involves the notion of sensation which has had a central role in philosophy since Descartes, and in particular the idea that sensations are the basic atoms of experience. This thesis, it is claimed, has blinded philosophers to the true character of experience; phenomenological description can avoid this theoretical assumption.

The first phenomenological discovery, following the reduction, is that ‘nothing has changed’. The world of objects does not disappear or dissolve into an airy realm of mere contents of consciousness. Nor does one’s experience transform into bare colour patches, uninterpreted sounds and so on. To characterize experience in this way is a ‘mistake’ which traditional epistemology has made.

A natural objection to raise at this stage is that no-one claims that uninterpreted sense data are what we are conscious of: they are rather to be construed as the unconscious building blocks of conscious experience. The phenomenological reply to that criticism is to ask what, if not conscious experience, is the basis for the philosophical belief in sensations?

The diagnosis is as follows: modern philosophy has taken its account of the physical world from physics which focuses exclusively on the primary qualities of objects. Philosophers, notably Locke, set themselves the task of reconciling this account of the physical world with human experience (see Locke, J. §2). The thesis is that objects as construed by physics have powers to affect experiencing subjects. The notion of sensation as the basic data of perception is derived, not from experience, but from scientific findings, in particular scientific accounts of human sense organs: given what our sense organs are like, this is what the basic sensory data *must* be like. Sensations are theoretical entities of psychology. Philosophical accounts of perception and empirical knowledge, empiricist and rationalist alike, have endorsed this same notion of sensation.

The phenomenological criticisms of these philosophical theses are, first, that while theoretical entities may have a place in the natural sciences, they have no legitimate place in philosophical enquiry. Physics offers a highly abstract conception of objects. This has been extremely successful in making predictions about the world and facilitating manipulations of it; but philosophy and science have different aims. Philosophy should not take scientific realism for granted. The thesis that objects are properly defined in terms of their primary properties is another philosophical thesis which phenomenological description should not presuppose. Second, sensations are theoretical entities of a school of psychology which fails on its own terms to give an adequate account of perception. But, even if the notion of sensation had been a successful one in scientific psychology, that would be no reason for philosophy to adopt it. It is not just the notion of sensation but also the psychologists’ conception of the mind as having contents which is challenged by phenomenology. This conception of the mind is another assumption which phenomenological description needs to avoid. Third, the notion of sensation has given rise to problems in epistemology which are insoluble because that very notion of sensation as mental contents caused by external objects always allows the sceptical challenge to be put, since there is no way of testing the causal claim. That the relation between experience and objects is a causal, contingent one is another presupposition which phenomenological description is to avoid. Moreover, even if knowledge of the external world could be justified by being shown to be based on sensations, this would not justify *our* claims to knowledge since sensations are not the

basic data of our perceptions. Nothing in the phenomena supports this notion of sensation.

According to phenomenology, the philosophical thesis that sensations are the basic units of experience is not only false; it is indicative of a misconception of the philosophical enterprise. It is not the task of philosophy to seek to reconcile the findings of science with experience, but to explore the experiential basis of beliefs, including scientific ones. Phenomenological description aims to reveal, not the constitutive parts - the 'atoms' - of a phenomenon, but the greater whole, the 'synthesis' which makes it the phenomenon it is. Careful scrutiny from the reflective standpoint, can reveal this 'synthesis' because all its details are 'implicit' in the phenomenon. In the natural attitude, one notices only the explicit features.

How does one set about phenomenological description? First one selects a philosophically significant topic, a 'theme', for example, perceiving physical objects. Next, one selects a phenomenon - for example, seeing a table. What is implicit in this phenomenon? What are the surrounding features which make it the phenomenon it is? Vision is explicitly involved. Vision and other senses are implicitly involved: if we see something as a table, we have a range of expectations concerning how it would appear from other angles, to the touch, to hearing, and so on. Support for the claim that these expectations are implicit in the phenomenon lies in the fact that we would be surprised if they were not realized in the appropriate circumstances. If we explore these expectations further, we find that implicit in seeing the table are certain motor skills: we could move around the table, bump into it and so on. Also involved in perceiving the table is that one knows what sorts of uses tables are put to, which typically involves having engaged in those practices. The significance of the table as something to be sat at, worked on or eaten from is implicit in seeing it and refers back to practices of sitting, working and eating. These are all features of the perceiving subject.

Phenomenological description also reveals implicit features of the object perceived, the wider 'synthesis' surrounding the way the table is involved in this phenomenon. The table appears as figure against a ground. The background contributes to the phenomenon - one would miss it if it were not there; but it is not the focus of one's attention. The table presents itself as a unified object, persisting unchanging as one walks around it. The table looks heavy, smooth, dusty, bare, uncluttered - colours and shapes are not the only visible features. The table appears as an artefact, manufactured from raw materials by someone using other artefacts; it was made for someone's use, in a certain sort of social setting. These are the sorts of features which phenomenological description reveals.

3 Uncovering essence

Such descriptions of specific 'concrete' phenomena, it is claimed, bring to light the richness and variety of the lived-world in contrast to the abstractions in terms of which scientific theory represents the world. The philosophical significance is twofold. First, such descriptions, it is claimed, have a critical role: they show that the theoretical presuppositions which were originally set aside are false: the descriptions serve as counterexamples to any philosophical theory which endorses the presuppositions. Second, they have a positive role: by describing particular phenomena, one can uncover essences, essential features of the lived-world.

One essential feature of phenomena is the intentionality of consciousness: consciousness is directed upon objects (see Intentionality). The phenomenological interpretation of this, what attention to the phenomena reveals, is that the relation between consciousness and its objects is an internal one. As such, it is not amenable to causal explanation. All consciousness is essentially consciousness of objects and all objects are essentially, if not explicitly, objects of consciousness. Idealist and realist claims to the contrary ignore this essential feature implicit in all phenomena.

An essential feature of perception is that it presupposes practical skills. All perceptual knowledge essentially depends on knowing how. Propositional knowledge is always 'situated' in practice. Philosophical accounts of the foundations of knowledge have often ignored this essentially practical foundation.

An essential feature of objects is their practical significance for us: they resist or assist our efforts to use them and live with them. Objects of theoretical knowledge are essentially also objects of our concern. Philosophical accounts of the character of objects in the external world have ignored this essential basis of theory in practice. Further, objects of the lived-world are not discrete entities, standing in causal, mechanical, contingent relations; they have internal relations with each other. Objects are essentially parts of complex wholes.

This move from description to essence looks problematic since it appears to involve a move from particular claims to universal and necessary ones. Phenomenologists differ in the way they purport to uncover essences. For transcendental phenomenology, essences can be detected only from the reflective standpoint, the standpoint of the transcendental ego. Essences have their origin in the transcendental ego: experience is structured as it is because the ego is structured as it is. Husserl believed that transcendental phenomenology leads to transcendental idealism (see Idealism §§3, 7). For existential phenomenology, there is no such transcendental ego, no transcendental grounding of the essential features of experience. The reflecting subject, the subject that is practising phenomenology and finding essential features of the lived world, is still an existential subject, living in the world.

As a test for what is essential, Husserl uses the criterion that we cannot imagine it otherwise. So, for example, we cannot imagine a perception of a physical object which did not involve ‘horizons’, expectations concerning other possible perceptions of it; we cannot imagine believing that a solid physical object exists without also knowing that there are possible circumstances - waking from a dream, its fading into thin air - which would show that belief to be false.

Merleau-Ponty looks for essential features of the perception of objects in natural capacities which are temporally prior to perceiving objects. He appeals to psychological data (drawn especially from Gestalt psychology) concerning, for example, the way babies focus their eyes on objects of interest and comfort while quite unable to focus on other less significant objects in their visual field (see Gestalt psychology). Such examples, he claims, show that natural responses to significant surroundings are temporally prior to the perception of objects. From this temporal priority, Merleau-Ponty believes, follows a logical priority: there are necessary prerequisites of learning or perceiving, features implicit in experience without which we would not have the experience we do.

Husserl and Merleau-Ponty believed that, by uncovering essences, phenomenology could avert the ‘crisis’ threatened by the prevalence of positivism. Heidegger and Sartre introduce an explicitly moral dimension into the search for essences. Both believe that one can reveal essences by stripping away all that is inauthentic in one’s dealings with the world. For Sartre, the search will reveal that all essence is dependent on human interests, human projections of non-being onto the world of Being; for Heidegger the end point of the search will be that Being will simply reveal itself as that with which we are ‘primordially’ connected (see Being §4). Analytic philosophers have problems with that ‘Being’. A sympathetic reading of these phenomenologists would be that they are seeking to characterize, not a state which philosophical enquiry enables one to achieve, but rather the process of philosophical enquiry. One may never reach the point at which all one’s beliefs are true, all one’s values as they ought to be. There may be no sense to attach to such a possibility, nothing which would count as recognizing it to obtain. One can, none the less, strive against false beliefs and bogus values. On this reading, Heidegger and Sartre may appear misguided in their attempts to say the unsayable; but we can see them as putting forward recognizable philosophical ideals.

4 Phenomenological ontology

Phenomenology shares with Cartesian dualism the belief that subjects and objects are radically different kinds of thing. They are not, however, logically distinct, nor are they the kinds of thing Descartes took them to be (see Descartes, R. §8). Subjects are essentially situated in the world, and the world of objects is essentially our home. Philosophical accounts of conscious subjects and objects in the world must never lose sight of this essential interrelatedness. The transcendental ego might seem to constitute an exception to this; but the claim of transcendental phenomenology is that the transcendental standpoint is just one standpoint which the ego can take and, from that standpoint, it can reflect upon itself as an empirical ego essentially situated in the world.

The phenomenological account of the conscious subject is of a viewpoint on the world, an ‘openness’ to the world. Further, since perceiving the world essentially involves acting in and on the world, the conscious subject is essentially an active and, so, embodied subject. Our bodies are not mechanisms in which consciousness happens to reside; they are the possessors of habits and skills without which action - and therefore perception - would not be possible. All phenomenologists emphasize the importance of the body, but Merleau-Ponty produces the most systematic account. Bodily skills and habits - what he terms ‘bodily intentionality’ - are in many respects exercized ‘pre-consciously’: conscious attention to habitual engagement with one’s familiar surroundings can, notoriously, disrupt performance. Subjectivity is essentially bodily. The subject of consciousness depends on the

‘body-subject’. The body, with its skills and habits, cannot operate except on appropriate instruments, in a suitable habitat, in a world of objects amenable to its skills - miming is a special art.

The phenomenological account of objects is that they present themselves as objects of our gaze, to be wondered at. We perceive them, not as bearers of purely factual primary and secondary properties, but as having all manner of significance, ambiguities and indeterminacies. Sartre writes with approval that Husserl has restored to objects their horrors and their charm. For phenomenology, these - usually deemed at best tertiary properties of objects - are the properties which make them possible objects for us, that without which we could never have discovered their primary and secondary properties.

Underlying the perceptual properties of objects are their practicality: they are, in Heidegger’s terms, ‘ready-to-hand’ prior to being ‘present-at-hand’. As such, they presuppose wider wholes which give the specific instruments a meaningful context. Ultimately, the context is the whole world, and it is a communal world - an essential backdrop for all subjects.

In summary, subjects are essentially bodily, with skills and habits which require instruments and habitats to develop and come into play. The intentionality of consciousness depends on bodily intentionality. Objects compel, invite or resist our actions. Our ability to view them with a neutral scientific gaze involves our ignoring the very features which enable them to be objects for us.

Modern philosophy, empiricist and rationalist, it is claimed, has ignored these fundamental interactions which are presupposed by any propositional knowledge of the world. Deprived of this practical underpinning, propositional knowledge is open to sceptical challenge in a way in which practical knowledge, knowing how to do things, is not. Any notion of a pure conscious subject or an independently existing object is the result of a process of abstraction from the lived-world. To proceed to worry about how the one can interact with or have knowledge of the other is to forget the starting point in practice from which the process of abstraction proceeds, a starting point which, according to phenomenology, is implicit in all phenomena and can be read off from them from a suitably reflective standpoint.

A natural objection to raise against phenomenology is that it gives an account only of intentional objects, objects of consciousness, and not of ‘real’ objects in the external world. The phenomenological rejoinder to this is firstly, that intentional objects are not to be construed as mental contents, inner effects or representations of an external world. Second, phenomenology would press the objector to articulate the distinction between intentional and ‘real’ object. Phenomenology explores the basis in experience of claims concerning the existence of ‘real’ objects; any account of ‘real’ objects which does not so relate them to objects of experience is strictly nonsense. On the phenomenological account of our relations with the external world, we find that our experience is mostly just as it should be to support our claims that the world exists and that we know that it does.

Heidegger, M. (1927) *Sein und Zeit*, trans. J. Macquarrie and E. Robinson as *Being and Time*, Oxford: Blackwell, 1962.(Difficult and often obscure. The translation is conscientious, with helpful notes and index.)

Heidegger, M. (1993) *Basic Writings*, trans. D. Farrell Krell, London: Routledge.(Selection of Heidegger's works from 1927 until his death. The later works promise a depth which is challenging if hard to fathom. Contains a general introduction, and brief introductions to each section.)

Husserl, E. (1931) *Cartesianische Meditationem*, trans. D. Cairns as *Cartesian Meditations*, The Hague: Martinus Nijhoff, 1977.(Short but demanding text outlining the phenomenological method, with many technicalities and few examples. The translation is mainly faithful, with many notes.)

Husserl, E. (1936) *Die Krisis der europäischen Wissenschaften und die transzendentale Phänomenologie*, trans. D. Carr as *The Crisis of European Sciences and Transcendental Phenomenology*, Evanston, IL: Northwestern University Press, 1970. (A longer and more readable work than *Cartesian Meditations*. The translation contains a helpful introduction and notes.)

Langer, M.M. (1989) *Merleau-Ponty's 'Phenomenology of Perception': A Guide and Commentary*, London: Macmillan.(Detailed exposition of Merleau-Ponty's text.)

Merleau-Ponty, M. (1945) *Phénoménologie de la Perception*, trans. C. Smith as *Phenomenology of Perception*, London: Routledge & Kegan Paul, 1981.(Combines detailed criticism with engaging description. The translation replaces a detailed and useful table of contents with an index.)

Sartre, J.-P. (1943) *L'Être et le Néant*, trans. H. Barnes as *Being and Nothingness*, London: Methuen, 1958. (Combines at times tortuous argument with flowing and peceptive descriptions. This translation has been criticized for inaccuracies, but the introduction by Mary Warnock is helpful as, in parts, is the Key to Special Terminology.)

Philip the Chancellor (1160/85-1236)

Philip occupies a pivotal place in the development of medieval philosophy. He is among the very first in the Latin West to have a fairly complete picture of both the newly available natural philosophy and metaphysics of Aristotle and the work of the great Muslim thinkers, Avicenna and Averroes. His Summa de bono, composed sometime between 1225 and 1236, shows the broadening of philosophical interests and the growth of philosophical sophistication that accompanied reflection on these new materials. Philip's Summa had a major impact on subsequent thirteenth-century thinkers, particularly Albert the Great, whose own Summa de bono is closely modelled on that of Philip.

Philip the Chancellor (Philippus Cancellarius) studied at Paris and became Master of Theology there. He was named chancellor of Notre Dame in 1217 and held that position until his death. As the chancellor, Philip was charged with supervising teaching at the University of Paris, and in that capacity he was a key player in several of the university's formative crises. In addition to *Summa de bono*, his works include various (unpublished) *quaestiones*, some four hundred sermons (still unpublished), a homiletics manual on the Psalms and some highly regarded poetry.

Philip's *Summa de bono* is a massive summary of theological and philosophical matters, roughly similar in size to Peter Lombard's *Sentences* and William of Auxerre's *Summa aurea*. However, although Philip's project is in the tradition of these earlier works, it is strikingly different. He takes the notion of the good (*bonum*) as the point of departure and organizing principle for his *Summa*. After a brief introductory discussion which includes three questions on the metaphysics of goodness and four on the highest good and the way created good flows from it, he devotes the entire work to created goods. He offers no extended treatment of God, the Trinity, Incarnation or the sacraments, topics that dominate Lombard's *Sentences* (see Lombard, P.)

The main parts of Philip's *Summa* correspond roughly to the divisions marked by his theoretical classification of the main kinds of created good. The first part is devoted to the good creatures possess by virtue of their nature (*bonum naturae*). Under this heading he discusses the nature of purely intellectual creatures (angels), purely corporeal natures (things created on the first five days of creation), and creatures composed of both intellectual and corporeal natures (human beings). The short second part is devoted to the good possessed by actions by virtue of their type (*bonum in genere*). The third and last part deals with the good that belongs to a creature because of a perfection it has by virtue of both its own nature and activity and the activity of God. Philip calls this the good associated with grace (*bonum gratiae*) and includes under it the topics of grace and virtue. In this third part of *Summa de bono*, Philip gives only passing attention to questions having to do with grace, devoting most of it (roughly half the entire *Summa*) to a detailed treatment of the theological and moral virtues. This part of the *Summa* significantly advances the project, begun by William of Auxerre, of elaborating a comprehensive, systematic moral theory.

Philip's classification of created goods identifies two other sorts of created good which do not figure in the plan of the *Summa*: the good that belongs to an action because of features of it less general than its type - namely, its end and circumstances (*bonum a fine, bonum a circumstantia*) - and the good associated with a perfection that is a pure gift of God - namely, glory (*bonum gloriae*). It is unclear whether Philip intended to include discussions of these goods and, hence, whether he left the *Summa* unfinished. *Summa de bono* is best known for its opening questions, which may constitute the first systematic treatise on the transcendentals. In his prologue, Philip proposes to begin the *Summa* with an inquiry into the relation of good (*bonum*) to being, one and true (*ens*, *unum*, *verum*) because these are the most general principles and because ignorance of the nature of principles can lead one to shipwreck in matters of faith. Philip's position in these questions is seminal. Drawing on suggestions from the newly available Muslim tradition of commentary on Aristotle and reflecting a new, sophisticated familiarity with the concepts of Aristotelian metaphysics, Philip's account centres around the thesis that the transcendentals are extensionally equivalent, although they are intensionally or conceptually distinct. The exposition and defence of this thesis is the defining characteristic of the thirteenth-century discussion of the transcendentals, which includes the work of Alexander of Hales, Albert the Great, Aquinas and Bonaventure.

Philo of Alexandria (*c.*15 BC-*c.* AD 50)

Philo of Alexandria is the leading representative of Hellenistic-Jewish thought. Despite an unwavering loyalty to the religious and cultural traditions of his Jewish community, he was also strongly attracted to Greek philosophy, in which he received a thorough training. His copious writings - in Greek - are primarily exegetical, expounding the books of Moses. This reflects his apologetic strategy of presenting the Jewish lawgiverMoses as the sage and philosopher par excellence, *recipient of divine inspiration, but not at the expense of his human rational faculties. In his commentaries Philo makes extensive use of the allegorical method earlier developed by the Stoics. Of contemporary philosophical movements, Philo is most strongly attracted to Platonism. His method is basically eclectic, but with a clear rationale focused on the figure of Moses.*

Philo's thought is strongly theocentric. God is conceived in terms of being. God's essence is unreachable for human knowledge (negative theology), but his existence should be patent to all (natural theology). Knowledge of God is attained through his powers and, above all, through his Logos *('Word' or 'Reason'), by means of which he stands in relation to what comes after him. In his doctrine of creation Philo leans heavily on Platonist conceptions drawn from reflection on Plato's Timaeus. The conception of a creation* ex nihilo *('from nothing') is not yet consciously worked out. Philo's doctrine of human nature favours the two anthropological texts in Genesis 1-2, interpreting creation 'according to the image' in relation to the human intellect. With regard to ethics, both Stoic concepts and peculiarly Jewish themes emerge in Philo's beliefs. Ethical ideals are prominent in the allegorical interpretation of the biblical patriarchs.*

Philo's influence was almost totally confined to the Christian tradition, which preserved his writings. He was unknown to medieval Jewish thinkers such as Maimonides.

1 Life and works

The thought of Philo of Alexandria is very much the product of his combined Alexandrian and Jewish background. Biographical details are very scarce, but we know that he was born into a prominent and extremely wealthy Jewish family (Josephus, *Antiquities* XVIII 258). In AD 39 he was chosen as leader of a delegation that sailed to Rome to protest to the emperor Gaius Caligula against the pogrom suffered by the Jewish community of Alexandria at the hands of the local populace. The interview with the emperor went badly, but did not cost him his life (see the unintentionally hilarious report in *Embassy to Gaius* 349-67). This incident is often connected with a passage at the beginning of *On the Special Laws*, where Philo complains that involvement in political affairs distracts him from more serious pursuits, and looks back wistfully to the time when he could fully devote himself to the life of philosophy.

From his writings it is apparent that Philo received a thorough training in Greek philosophy, although we have no idea from whom he received it (it has been suggested he may have had house tutors). His knowledge of the Platonic and Stoic traditions is especially thorough. His writings thus provide important, although imprecise, information on contemporary philosophical developments in Alexandria. Philo's extensive use of Plato's *Timaeus* and other dialogues reflects the beginnings of the Middle Platonist movement associated especially with the figure of Eudorus (see Platonism, Early and Middle §1). He is also the first writer to cite the so-called 'ten modes' of the Neo-Pyrrhonist Aenesidemus, who was active in Alexandria a generation before his birth.

Philo was a prolific writer, and the majority of his works appear to have survived. These amount to exactly fifty treatises in all. They can best be divided into three separate groups:

(1) There are five purely *philosophical* treatises, discussing subjects such as the eternity of the cosmos, divine providence, and the rationality of animals. These offer much valuable material on Greek philosophy, and it is only occasionally possible to discern that their author was Jewish.
(2) In addition there are four *historical/apologetic* works, in which Philo defends Judaism against contemporary attacks.
(3) The remaining forty-one works are all *commentaries* on the books of Moses.

These are best sub-divided into four categories:

(a) Two books on the life of Moses, introducing the writer of the holy books to a broad public, both Jewish and Greek.
(b) Ten books on the Exposition of the law, first describing the creation of the world (Genesis 1-3) and the lives of the patriarchs Abraham and Joseph, then expounding the Decalogue, the Special Laws and other subjects related to Mosaic legislation.
(c) The Allegorical commentary in twenty-one books, giving an astonishingly complex running commentary on Genesis 2-17, in which the chief exegetical method used is allegorization of the text.
(d) Eight books of Questions and answers on Genesis and Exodus, in which questions are posed on most verses of the biblical text, and both literal and allegorical answers are given in a consecutive but formally unconnected way.

The great majority of Philo’s writings thus concentrate on the five books of Moses (or Pentateuch), which he read in the Greek translation of the Septuagint. The direction of Philo’s loyalties is very clear. He wishes to defend the cultural and religious heritage of his people in their minority position in Alexandrian society. His chief apologetic strategy is to focus in on the figure of the great sage Moses, exploiting the considerable prestige accorded to barbarian sages such as Zoroaster and the Egyptian priests in contemporary Greek philosophy. Moses is the great sage and paradigm for righteous and holy living. His writings, if appropriately read, are an inexhaustible fount of wisdom.

It may seem, however, that Philo is facing an impossible task. Only a few passages in the Pentateuch, such as the creation account and the stories of Moses on the mountain, offer much scope for philosophical elucidation. His solution is to exploit the method of allegorical interpretation, invented and developed by earlier Greek philosophers (including Stoics) in order to defend the authority of Homer. Like Homer, Moses allegorized: that is to say, he said one thing but meant another. The meaning behind his words has to be uncovered. Moses tells the story of the patriarch Abraham (and Philo would never deny that this progenitor of the Jewish race existed), but the deeper meaning of the text reveals the story of the human soul on the path to perfection and felicity (see §6). Philo is one of the great masters of the allegorical method. In practice it gives him the scope he needs to introduce Greek philosophical doctrines and so develop his own philosophical views by means of a presentation of Mosaic thought.

2 Philosophical position

Understandably, Philo shows no loyalty to any particular school of Greek philosophy. None can match the prestige enjoyed by the school of Moses. From this viewpoint Philo’s method may be considered thoroughly eclectic, but with a clear rationale. It is apparent from his commentaries, however, that his philosophical sympathies lie with Platonism. He is particularly attracted to the revival of transcendentalism undertaken in the Middle Platonist movement. Stoic doctrines are found especially in the area of ethics (see §6). Other themes reflect the influence of Jewish thought, and so offer interesting contrasts with ideas in Greek philosophy.

3 Epistemology

Philo makes no attempt to present a systematic theory of knowledge, but there is at least one epistemological question that he cannot avoid: How was it possible for Moses to attain the pinnacle of human wisdom? Moses is regarded as a prophet, exalted beyond other human beings. Philo distinguishes between two types of prophecy, both of which have antecedents in Greek reflection on the subject. In the first kind, which enables the prophet to predict the future, the prophet is empowered to ‘stand outside’ himself and through divine possession become an instrument of the divine voice speaking through him. This may be called *ecstatic* prophecy. In the second type the prophet is also inspired by God, but remains in full possession of his rational abilities, which allows his mind to contemplate the nature of reality in its fullness. This may be termed *noetic* prophecy. The prophet is one who ‘through virtue rather than birth has advanced to the service of the truly Existent,…since he has within him a noetic sun and shadowless beams of light, which give him the clear apprehension of things invisible to sense but perceptible to the mind’ (*On the Special Laws* 4.192). Philo’s Platonist assumptions emerge clearly here, even if the term ‘apprehension’ (*katalēpsis*) has a Stoic background. It is above all this second type of prophecy, exemplified by Moses’ vision of the *paradeigma* (a Platonic technical term) of the tabernacle and its contents on Mount Sinai (*Exodus* 25: 9), that enables him to be the sage *par excellence* and the author of the sacred books.

4 Theology

As a result of his Jewish background Philo's thought is resolutely theocentric. God is conceptualized primarily in terms of true being. The link to Platonism is apparent, but for Philo the source is above all God's words to Moses in Exodus 3:14, 'I am he who IS'. It is typical of Philo that he alternates speaking of God in personal and impersonal terms: that is, between 'he who is' and 'that which is'.

Crucial to Philo's theology is the distinction between God's *existence* and his *essence*. Through observation and experience of the natural world and particularly of their own intellectual powers, human beings can without any difficulty conclude that God exists and that he is creator of the universe. However, gaining knowledge of God's essence is beyond the reach of human conceptual abilities. Not even the great Moses, although he made many requests, was granted this privilege. God is unknowable in his essence, and thus also unnameable, uncircumscribable and unutterable: that is, there is no name or description that can give accurate expression to his essential nature. Philo thus has a negative and a positive theology, rather similar to what one finds in the Middle Platonist handbook of Alcinous.

God is thus utterly transcendent. At the same time, however, he stands in close relation to the cosmos as its creator and provident maintainer (see §5). Philo argues that the two chief names for God refer to his powers (*dynameis*). The name *theos* (God) indicates his creative power (from the root *tithēmi*, 'I set in place'); the name *kyrios* (Lord) indicates his ruling power. More famously the figure of God's Logos (usually rendered 'Word', but 'Reason' is better) is invoked in order to explain God's relation to what is other than him. Philo's Logos doctrine is complex and certainly not always philosophically consistent. This is due to its double origin in both Jewish thought (especially the 'and God said' in Genesis 1) and Greek thought (especially Stoicism (§3)) (see Logos). The Logos has an immanent aspect, indicating the divine presence in the created realm. It also has a transcendent aspect, and is sometimes identified with the intelligible world. The chief difficulty posed by Philo's doctrine of the Logos is the following. Sometimes Philo speaks of the Logos as if it were simply an aspect of the divine nature, namely that aspect which is accessible to human thought precisely because it is related (in a model/image relation) to that which follows it. At other times the Logos is treated as a *hypostasis*, that is, a self-subsistent theological entity that is at least to some degree independent of God himself. As a Jew, however, Philo refuses to accept the Platonist solution of a hierarchy of divine principles at different ontological levels (see Neoplatonism §3).

5 Doctrine of creation

A second pillar of Philo's thought is the doctrine of creation. Philo is utterly convinced that visible material reality has been created by God, and has nothing but scorn for the minority opinion that it was the result of chance or spontaneous development. Furthermore, because God has created the universe, he will also take care of it through the action of divine providence. Philo agrees with Plato against the Stoics that, although the universe had a beginning, it will not be subject to total destruction. This, he argues, was already Moses' view, as shown by Genesis 8: 22 (see *On the Indestructibility of the Cosmos* 1-19).

In his treatise *On the Creation of the Cosmos According to Moses*, Philo presents his views on creation in greater detail. The cosmos was created in six days. This does not mean that God needed a length of time in which to complete his work. In fact, everything came into being simultaneously, because time commenced with the cosmos itself. The details of Philo's interpretation are strongly influenced by contemporary interpretations of Plato's *Timaeus*. Remarkably, the first day of creation is taken to describe the creation of the intelligible cosmos, which serves as model for the visible cosmos and is equated with the Logos (see §4). If one would wish to summarize the doctrine of creation, Philo writes, 'one might say that the noetic cosmos [of day one] is none other than the Logos of God while he [that is God] is engaged in his creative task' (*On the Creation of the Cosmos* 24). It is noteworthy that Philo does not dissociate God from the creative task and attribute it solely to his Logos, because this would surely endanger the conviction of a unique God.

Philo is less than clear on the origin and ontological status of matter, and especially on the question whether it is created by God or has an independent existence before creation. He does not discuss the question in his commentary on the creation account (Genesis 1: 2 is taken to refer to the intelligible world), and elsewhere he appears to vacillate. It is safest to conclude that he remains prisoner of the axiom almost universally present in Greek philosophy that nothing can come out of nothing, and so is unable to face the full consequences of a doctrine of creation *ex nihilo* such as was developed in early Christian thought (in reaction to Gnosticism).

Philo's cosmology follows the dominant Platonic-Aristotelian model. The cosmos is a work of great beauty and order, produced by a good and gracious creator. It is not autonomous, and certainly should not be worshipped. This was the mistake made - in terms of Philo's allegorical scheme - by the Chaldaeans, whom Abraham left behind in his search for the true God (*On the Life of Abraham* 68-71).

6 Doctrine of human nature, ethics

Philo's doctrine of human nature, the third pillar of his thought, is based primarily on the two texts in the creation account, Genesis 1: 26-27 and 2: 7, both of which are interpreted in terms of the Greek philosophical ideal of human reason. In the former text human beings, male and female, are created 'according to the image (*eikōn*) of God', which is taken to mean that they resemble God not in terms of the body or the lower soul with its passions, but through the rational soul or the mind, which is also their immortal part. In the latter text the human body is 'inbreathed' by God's spirit (*pneuma*). This creative act is also taken to refer to the formation of the human rational faculty. Following basically Platonist lines, Philo regards the human goal (*telos*) as 'assimilation (*homoiōsis*) unto God'. This can be accomplished because of the human image relation to God: that is, it can be accomplished through the powers of the intellect. It is in gaining knowledge of God that humans become like God. This was the nature of Moses' paradigmatic quest. What might seem to be the ultimate goal, however, the knowledge of God's essence, is unreachable, because then assimilation would become identity, which is impossible on account of the gulf separating creator and creature (an instructive contrast can be drawn with Plotinus' doctrine of the union with the One; see Plotinus §3).

In the formulation of his ethical ideals Philo extracts much from Stoicism, but places it in a basically Platonist framework. The journey of the soul involves various stages. It begins with the struggle against the passions resulting from association with the body. As learners advance, they develop the exercise of reason and embark on the path of the virtues. The goal to be attained is the life of perfection, the life lived by the wise person (*sophos*). The wise person is characterized by a freedom from all passion (*apatheia*), not in the sense of having no emotions whatsoever, but because irrational passions have been converted into rational emotional states (*eupatheiai*). However, the ideal of the wise person as represented by Moses is lofty and seldom attained. For many the patriarchs are more accessible symbols of the level a human being can attain. They represent three aspects of the quest for perfection. Abraham is the learner, Isaac is the man with natural aptitude for the quest, Jacob is the practiser who never yields in his struggle to reach the goal. The quest for perfection and the ideal of the wise person is the fourth and final pillar of Philo's thought.

Philo's ethics are not entirely Greek. In his treatment of the virtues Jewish themes can be detected. Philo is more positive towards the feelings of repentance and pity than we find in Greek ethics, and tends to regard piety as the greatest of the virtues. Foreign to Greek philosophical thought also is his emphasis on the nothingness (*oudeneia*) of human beings before God's face, a theme which anticipates the role of humility in Christian ethics.

7 Influence

Philo's influence on the course of philosophical thought was limited to the Christian tradition. The church fathers preserved his works because his method of using Greek philosophical themes to explain scripture appealed to them. Attempts by Wolfson (1947, 1968) and others to demonstrate Philo's influence on later Platonist thought have not been successful. Medieval Jewish philosophers did not know Philo, and Jewish interest in him did not revive until the sixteenth century. From the viewpoint of the history of ideas Philo is interesting above all because in his writings the traditions of Greek philosophy and Judaeo-Christian thought converge for the first time.

DAVID T. RUNIA

List of works

The names of Philo's fifty treatises cannot be included here (but see the sub-division given in §1). A list with the conventional English and Latin titles can be found at the beginning of Loeb Classical Library edition. The chronology of individual writings cannot be determined with any certainty.

Philo (20-50 AD) *Philo*, trans. F.H. Colson and G.H. Whitaker, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1929-62, 10 vols, plus 2 suppl. vols, trans. R. Marcus.(The standard English translation, with Greek text; badly in need of revision.)

Philo (20-50 AD) *The Works of Philo Complete and Unabridged*, London: Bohn's Classical Library, 1854-5; repr.,

trans. C.D. Yonge, Peabody, MA: Hendrickson, 1993.(A single volume edition with modern numbering; unreliable and incomplete.)

Philo (20-50 AD) *On Providence*, vols I and II in M. Hadas Lebel (ed.) *Les Œuvres de Philon d'Alexandrie*, vol. 35, *De providentia I et II*, Paris: Les Éditions du Cerf, 1973.(Survives only in Armenian; not included in the Loeb Classical Library edition.)

Philo (20-50 AD) *On Animals*, ed. A. Terian, *Philonis Alexandrini de Animalibus: The Armenian Text with an Introduction, Translation and Commentary*, Chico, CA: Scholars Press, 1981.(Survives only in Armenian; not included in the Loeb Classical Library edition.)

Philo (20-50 AD) *The Contemplative Life*, trans. D. Winston, *Philo of Alexandria: The Contemplative Life, The Giants and Selections*, New York and Toronto, Ont.: Paulist Press, 1981.(The best anthology of Philo's writings, containing many of his more interesting philosophical passages.)

Philo (20-50 AD) *The Giants*, trans. D. Winston, *Philo of Alexandria: The Contemplative Life, The Giants and Selections*, New York and Toronto, Ont.: Paulist Press, 1981.(The best anthology of Philo's writings, containing many of his more interesting philosophical passages.)

Philo of Larissa (*c*.159-*c*.83 BC)

Philo, head of the Academy from 110 to 88 BC, likened philosophy to medicine. No doubt he was a conscientious therapist himself; but we know little enough about his methods and practices. For most of his life he seems to have been a happy sceptic, and an unremarkable one. But towards the end of his career he introduced - or was deemed to have introduced - startling innovations into the Academy: in particular, by rejecting or modifying the reigning definition of knowledge he was able to separate himself from the scepticism of his school and to rewrite its history.

1 Life and thought

Philo came from Larissa in Thessaly. As a boy he was taught philosophy by a certain Callicles, a friend of Carneades; so that by the time he moved to Athens - perhaps in 134 BC - he was already acquainted with Academic philosophy (see Academy). For some years he continued his studies with Clitomachus, whom he eventually succeeded as scholarch in 110 BC. He remained in office for two decades. Then, in 88 BC, during the turmoil of the Mithridatic War, he left Athens and travelled to Rome. He resumed his teaching, impressing Cicero and Cicero's friends. Some five years later he died.

Our evidence for Philo's thought is meagre. The most substantial text develops a parallel between philosophy and medicine. Doctors must first persuade their patients to accept their own treatment and to reject the advice of rival practitioners; then they must eliminate the causes of disease and implant the causes of health; next they must examine the nature of health, which is the goal of their art; fourth, they must produce comprehensive prescriptions for diet and regimen; and finally - for life is brief and patients are busy - they must prepare a summary brochure on 'healthcare for all'.

So it is also with philosophers. First, a protreptic discourse commending virtue and refuting its detractors; then the elimination of false opinions, which infect the organs of the soul, and the introduction of true opinions; third, an account of the ultimate aim of philosophizing, namely 'happiness' (see Eudaimonia); then practical prescriptions, comprising an ethics and a political philosophy; and finally handbooks for the hurried.

The conception of philosophy as mental therapy was neither unique to Philo nor original to him, but his is the most expansive version of the thing which any ancient text presents. We know little about the particular forms which his therapy took: one notice indicates that he did not altogether abjure the soft pleasures of the Epicureans; another informs us that he taught rhetoric (but perhaps separately from philosophy); otherwise the chief points of interest lie in epistemology.

2 Epistemology

For most of his career Philo of Larissa appeared as an unexceptional philosopher. He continued the Academic technique of arguing 'on both sides' (see Carneades §1); and he professed some form of scepticism. In short, 'he enhanced the teachings of Clitomachus' (Numenius, in Eusebius, *Preparation for the Gospel* XIV 9.1) without adding anything new to them. And then, near the end of his life, he produced work which scandalized his old colleagues, who could hardly believe that it came from his pen.

The innovation is depicted by Cicero as sudden and shocking, and dated to Philo's Roman period. Other texts hint at a gradual realization rather than a flash of enlightenment - and to some extent Philo seems to have been anticipated by Carneades' pupil Metrodorus. However that may be, the scandalous innovation appears to have had two aspects, one of them philosophical, the other historical.

Philo urged that

> as far as the Stoic criterion, i.e. apprehensive appearance (*phantasia katalēptikē*), is concerned, things are inapprehensible; but as far as the nature of the things themselves is concerned, they are apprehensible.
>
> (Sextus Empiricus, *Outlines of Pyrrhonism* I 235)

If things are apprehensible in themselves but not according to the Stoic criterion, then presumably the Stoic criterion is false: it must constitute, or be based upon, a mistaken conception of what knowledge is. And Cicero

reports that Philo 'weakens and destroys' the Stoic account of apprehension. In particular, he denied the crucial element in the Stoic account, namely the claim that an apprehensive appearance must be such that it *could not* have come from any source other than the source it in fact came from (*Academics* II 18) (see Stoicism §12).

We are not told why Philo rejected this claim: no philosophical arguments on the matter have survived. But we do know one result of his having done so: scepticism could now be avoided - for the Academic arguments for scepticism had fastened upon the very clause which Philo decided to reject (see Arcesilaus §2; Carneades §4).

Looking out of my window I receive an appearance of a magpie on the lawn. I thereby know that there is a magpie on the lawn provided that the appearance is an apprehensive appearance. According to the standard definition, the appearance will only be apprehensive if it *could not* have been caused by anything other than a magpie on the lawn. But surely it *could* have been caused by any number of other things - by a jay on the lawn or by an ingenious hologram. And something like this seems to hold not only of my magpie but of all appearances: hence scepticism. But once we reject the requirement that an apprehensive appearance *could not* have been otherwise caused, the sceptical argument collapses. Knowledge does not require that the magpie appearance *could not* have been caused by a jay - but only that it *was not* caused by a jay. Since the appearance was *in fact* appropriately caused, it is apprehensive; and I thereby know that there is a magpie on the lawn.

Such, or so it seems, was the philosophical aspect of Philo's innovation. It would be silly to shower praise on him, for we do not know why he rejected the standard account of knowledge, or what he offered in its place, or how he replied to the objections which his innovation excited. But his innovation was admirable: the requirement that apprehensive appearances *could not* have been otherwise caused is implausibly strong.

Philo was now able to look afresh at the history of the 'sceptical' Academy. Arcesilaus and Carneades, he saw, had not really been attacking *knowledge* or arguing for *scepticism*; rather, they had been attacking a false conception of what knowledge was. Perhaps they themselves supposed that they were attacking the very citadel of knowledge; but in point of fact they were tilting at an antiquated windmill. Hence the 'sceptical' Academy had never been sceptical: its heroes had never cast any doubt on the possibility of knowledge.

No need, therefore, to speak of an Old and a New Academy. The dogmatism of Plato's original school had presupposed the sane, Philonian, account of knowledge - an account which the Peripatetics had inherited; and the 'New' Academics had implicitly countenanced Platonic dogmatism. Hence Philo 'denied that there were two Academies' (Cicero, *Academics* I 13).

Philo's innovations were roughly greeted. Some Academicians maintained that his abandonment of the standard definition of knowledge was folly - and self-destructive folly to boot, inasmuch as he would now be dragged back to the very scepticism which he had hoped to escape (see Antiochus §2). Others accused Philo of misunderstanding the achievement of the New Academy and of betraying his heritage. The controversy was heated; but we learn no details. Nor does Philo seem to have had much effect. After him, it is true, sceptical Platonists were hard to find, but there is no reason to believe that this was due to the arguments of Philo.

Philo the Dialectician (late 4th-early 3rd centuries BC)

A member of the Dialectical school, Philo was a Greek philosopher whose claim to fame is twofold. First, he maintained that one proposition implies another if and only if either the former is false or the latter is true, however irrelevant the two propositions may be to one another. Second, he maintained that some things are necessarily prevented from happening and are nevertheless possible: the water around them prevents shells at the bottom of the ocean from ever being actually perceived; nevertheless, such things are perceptible. As often happened with Dialecticians' ideas, these ideas of Philo elicited (and perhaps were meant to elicit) notoriety rather than agreement.

1 Life, works and reputation

Philo's birthplace is unknown: the belief that it was Megara is a misconception based on the further misconception that he belonged to the Megarian school. In fact, Philo was a Dialectician (see Dialectical school). He was a pupil of the eminent Dialectician Diodorus Cronus at the same time as Zeno of Citium. In spite of his great admiration for both Diodorus and Philo, Zeno left to found the Stoic School (see Stoicism). Philo stayed. He wrote a no longer extant dialogue called the *Menexenus*; its characters included the five daughters of Diodorus, who were themselves all Dialecticians. He also wrote *On Meanings* (or perhaps *On Sign-Inferences*) and *On Forms of Argument*; these works too have been lost, as have the works which the prominent Stoic Chrysippus wrote in reply. Philo had the Dialectician's characteristic interest in paradoxes, and his name is associated with many of them. The only topics on which we have any details of his views are implication and modality.

2 What follows from what?

Hellenistic logicians generally, and rightly, agreed that no falsehood ever follows from a truth: for example, if it is daylight but I am not talking, then 'I am talking' does not follow from 'It is day'. In consequence, a necessary condition for one proposition to follow from another is that either the former is true or the latter is false. Then, as now, logicians agreed that this condition is necessary; then, as now, logicians disagreed over what other conditions are necessary (see Diodorus Cronus §3). Philo's contribution was to maintain that there are no other necessary conditions, and that this condition is therefore not only necessary but also sufficient. In short, according to Philo, one proposition follows from another when and only when either the former is true or the latter is false.

Already in antiquity, this definition was known to have some bizarre consequences. One is that whenever it is day but I am not talking, the proposition 'I am talking' does not follow from the proposition 'It is day'; it does however follow on all other occasions; that is, it follows throughout the night, and it follows also whenever I am talking in the daytime. Thus one proposition can follow from another even though the pair are, to all appearances, entirely irrelevant to one another. Another bizarre consequence known to antiquity is that 'It is day' follows from 'It is night' during the daytime, but not otherwise. Thus even where two propositions are relevant to one another in such a way that each evidently implies the other's falsehood, one of them will also imply the other's truth.

In modern times, people have sometimes given Philonian accounts of conditionals: a conditional is true, on such an account, if and only if either the antecedent is false or the consequent is true. No modern logician however has given such an account of when an argument is valid. Philo did. Like other Hellenistic logicians, he will have meant his definition of 'following from' to apply simultaneously both to the relation between consequent and antecedent in a true conditional and to the relation between conclusion and premises in a valid argument. According to all Hellenistic logicians, the conditional 'If it is day, it is night' is true if and only if the argument 'It is day; so it is night' is valid; and hence, according to Philo, that argument is valid throughout the night and invalid during the day.

It is not known why Philo adopted so strange an idea. His idea is however fairly easily inferred from a couple of assumptions which were widely current among Hellenistic logicians. One of those assumptions runs: validity is only one among several features which our reasonings should possess. That the conclusion follows from the premises is one thing; that the premises are acknowledged as true is another; that the conclusion is not already acknowledged as true is a third; and so on. The other assumption runs: each of these features contributes in a different way to turning our reasonings into decent proofs; and the distinctive contribution of validity is to ensure

that we will not reach false conclusions unless we have started from false premises. This distinctive contribution has been made if the conclusion follows from the premises in the manner defined by Philo. Hence why should not Philo's definition of 'following from' be an adequate definition of validity?

3 Possibility

Diodorus Cronus defined the possible as that which either is or will be true (see Diodorus Cronus §4). Philo devised examples which, if acceptable, refute Diodorus' definition. The examples ascribed to Philo have a common pattern. A typical example runs: a log in mid-Atlantic is not and never will be burning; this is because the log is 'necessarily prevented' from burning by the water that surrounds it; nevertheless, the log can burn; this is because the subject *log* is 'appropriate' to the predicate *burns*, and because 'the bare appropriateness of the subject' to a predicate is enough to make it, 'in itself and as far as its own nature is concerned', capable of having the predicate. Now only if things are possible does it make sense to talk about preventing them: thus since asbestos cannot burn, we need not immerse asbestos in the Atlantic, or take any other precautions, to prevent it from burning. Hence we cannot easily dismiss Philo's examples of possibilities that neither are nor ever will be actual. The very fact that they are prevented from happening indicates, we might say, that they are genuine possibilities.

It is not only Diodorus' definition that Philo's examples threaten. These examples threaten also the more widely accepted thesis that a thing cannot do what it necessarily does not do. For according to Philo's examples, things can act in ways in which they are necessarily prevented from acting; and yet it seems that they necessarily do not do what they are necessarily prevented from doing.

Perhaps Philo's purpose in devising his examples was simply to embarrass the consensus equating the impossible with the necessarily false. Later sources however tell us that, besides his examples, Philo also gave a definition of possibility. According to Philoponus: Philo says that the possible is that which is actualized or can be actualized, even though it never is actualized; as when we say that the shell at the bottom of the ocean is perceptible (*On Aristotle's Prior Analytics* 169).

And according to Boethius, Philo gave systematic definitions of a range of modal concepts:

> Philo says that the possible is that which, by the intrinsic nature of the proposition, would receive truth, as when I say that today I will reread the *Bucolics* of Theocritus: this, if nothing external prevents it, can in itself be truly asserted. This very same Philo defines the necessary in the same way, as that which, since it is true in itself, never could be receptive of falsehood. The non-necessary moreover he defines as that which in itself could receive falsehood: and the impossible as that which in accordance with its intrinsic nature never could receive truth.
>
> (*De Interpretatione* II 234)

The definition in Philoponus moves around too tight a circle to be illuminating. Less unhelpful are the definitions in Boethius. The definitions of the necessary and the non-necessary are not circular at all. Moreover, the clauses about 'intrinsic nature' mean that even the definitions of the possible and the impossible are not as tightly circular as the definition in Philoponus. Nevertheless, these definitions leave something to be desired. Where our subject is *log* and our predicate is *burns*, we have some independent understanding of talk about the subject's 'nature', and its 'appropriateness' to the predicate; but where our 'subject' is the proposition *I will today reread the Bucolics of Theocritus* and our 'predicate' is *true*, such talk is hardly comprehensible save as a long-winded way of saying that the proposition is possible. It is therefore difficult to avoid the suspicion that these definitions were devised not by Philo himself, but by later scholars drawing on his examples of unrealized possibilities. This suspicion is confirmed by the way that the definitions in Boethius invoke as unproblematic the equivalence between the impossible and the necessarily false that Philo's own treatment of his examples had apparently undermined.

Philodemus (*c*.110-*c*.40 BC)

Philodemus of Gadara, a Greek epigrammatic poet, was also an influential Epicurean philosopher. Scrolls containing many of his works, buried by the eruption of Vesuvius in AD 79, have been partially recovered and deciphered. Their themes include epistemology, theology, ethics, philosophical history, poetics, rhetoric and music. He energetically defends Epicureanism against other philosophies, and his own interpretation of Epicureanism against rival factions. Although not a notably original thinker, Philodemus became highly regarded in educated Roman circles.

Philodemus was born in Gadara, southeast of the Sea of Galilee, and died in Italy. He studied at Athens under Zeno of Sidon, then head of the Epicurean school, to whom he retained a lifelong loyalty. Moving to Italy probably in the 70s, he became a friend and philosophical adviser to L. Calpurnius Piso Caesoninus, the father-in-law of Julius Caesar. He seems to have spent some of his life at Herculaneum, probably in his patron's villa, where an Epicurean library consisting largely of his works was excavated in the 1750s. He was known and highly respected by Cicero, and seems to have numbered the poets Virgil and Horace among his circle.

Before the recovery of his philosophical library, Philodemus was known mainly as the author of some elegant epigrams preserved in the Palatine Anthology. Most of them are on the theme of love, but among the others are an invitation to a celebration in honour of Epicurus' birthday, poems about modest feasts and a prayer for a safe journey. The carbonized papyrus scrolls containing his philosophical treatises, because of the adverse physical conditions in which they survived, all lack at least their opening part, and most of them are altogether very poorly preserved. It has nevertheless been possible to gain from them considerable insight into Philodemus' working methods and attitudes to philosophical history and orthodoxy, and his views on the liberal arts. While some of his works may be independent compositions, others, such as *On Signs* and *On Frankness*, are little more than his own transcripts of the lectures he had heard from Zeno in Athens.

Philodemus' wide interest in rhetoric, music and poetry, although at first sight surprising in an Epicurean, is probably not untypical of the school in his day. With regard to rhetoric, he cites chapter and verse from his Epicurean authorities to attack as heterodox the austere rival wing of the school which regarded all rhetoric as philosophically unacceptable. In *On Music*, he criticizes the belief that music influences character: being irrational, it cannot influence the morally all-important rational soul, and it gains its educational power only when combined with language. His *On Poems*, as well as being a major source on Hellenistic poetics, is of particular interest for its development of the thesis that only the combination of word and thought can make a poem a good one. *On the Good King According to Homer* carries a covert political message for Philodemus' Roman audience, praising the mild Homeric king Alcinous as a just ruler who brings prosperity.

Later Philodemus turned to such ethical themes as death and anger, as well as to more practical topics like household management. His *On Frankness* is a work of especial interest, exploring its topic in the specifically Epicurean context of teacher-pupil relationships, with special emphasis on the therapeutic aspect of Epicurean philosophy as medicine for the soul. In *On Anger*, Philodemus seeks a middle position between the Stoic aim of eradicating passion and the Peripatetic ideal of 'moderate emotion': some anger is natural and inevitable, but it should always be controlled by reason to the greatest possible extent (see Peripatetics; Stoicism §19).

On Signs is an epistemological treatise, recording debates between Epicureans (including Zeno of Sidon) and critics who are probably Stoics. The Epicurean method of inference based on similarity, whose main species are (1) induction and (2) analogical reasoning from the visible to the invisible, is defended as both sound and scientifically fundamental (see Epicureanism §7). Two other works, *On the Gods* and *On Piety*, explore the nature of divinity and defend Epicurus' theology against critics who considered it impious. Philodemus' reverence for his Epicurean authorities finds a more concrete embodiment in his biographical studies of early Epicureans through their collected correspondence. He also gained some recognition for his historical work *Compendium of the Philosophers*, from which his histories of two schools, the Academy and the Stoa, partially survive among the papyri.

There is little evidence that Philodemus was interested in physics. His main fields were ethics, theology and the

liberal arts. He may be read as on the one hand a school loyalist, deeply concerned with Epicurean traditions and their correct interpretation, and on the other hand an ambassador mediating these traditions to a largely Roman audience.

Philolaus (*c.*470-380/9 BC)

The Greek philosopher Philolaus of Croton, a contemporary of Democritus and Socrates, was a pre-eminent Pythagorean. His book counts as the first written treatise in the history of Pythagoreanism. Surviving in fragments, it constitutes an important source for our knowledge of fifth-century Pythagoreanism and supplements the picture given by Aristotle of Pythagorean doctrine.

Like earlier Presocratics Philolaus sought to furnish a comprehensive cosmology. Arguing from logical propositions, he posited two pre-existing principles: 'unlimited things' and 'limiting things'. United by harmony these two principles account for the formation of the cosmos and its phenomena. Since Philolaus also invokes number as an all-powerful explanatory concept, it is likely that he associated his first principles and the things originating from them with numbers. The emphasis on harmony and number accords with early Pythagoreanism.

Philolaus also wrote on musical theory and astronomy. A noteworthy feature of his astronomy is the displacement of the earth from the centre of the cosmos by fire, pictured as the 'hearth' of the universe. The fragments further attest Philolaus' interest in embryology, the causes of diseases, and physiology combined with psychological functions.

It was not unusual for early Greek philosophers to treat such a wide variety of topics. The distinctive elements of the thought of Philolaus are the logical arguments evinced in the fragments and the epistemological role of number for understanding the structure of reality.

1 Life

It is generally believed that Philolaus was a native of Croton in southern Italy where Pythagoras had established a community of disciples, although Philolaus would have been too young to have known the master himself. He is also associated with Tarentum and Thebes, cities he is likely to have sought out after the anti-Pythagorean revolts in Croton around 450 BC. That he spent time in Thebes is certain from a report in Plato's *Phaedo* (61d) stating that Philolaus lectured in that city. This must have occurred before 399 BC, the dramatic date of the *Phaedo*. Plato himself, during his travels to Sicily around 388 BC, may have met Philolaus, but this remains speculative.

Ancient sources relate that Philolaus published three books of Pythagoras which Plato sought to buy at great expense. Although these books have been shown to belong to later pseudo-Pythagorean literature, the story at least indicates that Philolaus contributed to the dissemination of Pythagorean ideas and that Plato was interested in Philolaus. Indeed, Plato was charged in antiquity with having copied his *Timaeus* from a book by Philolaus. Bearing the standard Presocratic title, *On Nature*, Philolaus' text represents the first attested written work of Pythagoreanism. With Philolaus, Pythagoreanism passes from an oral to a written tradition. A core of the fragments that survive from Philolaus' book have been established as genuine. These, as well as the testimonies of other ancient authors about Philolaus, form the basis for reconstructing his philosophy.

2 First principles

The Presocratic tradition in Greek philosophy, for all its diversity, has in common the central quest to understand, explain and, if possible define the essential nature (*physis*) of the world. Philolaus emerges from that tradition. The very beginning of his book sets out clearly the object of his philosophical concern: 'The nature in the cosmos was joined together from unlimiteds and limiters, both the whole cosmos and everything in it' (fr. 1). Like other Presocratics Philolaus seeks to explain the nature that makes up this world-order, and from the outset he states his explanatory principles: unlimiteds and limiters (the Greek literally translates as 'unlimited and limiting things'). The existence of both is justified on logical grounds: since the cosmos cannot be composed solely of limiters nor solely of unlimiteds, it must therefore be composed of both, as is evidenced by the phenomena of the world (fr. 2). If all things were wholly limited or wholly unlimited, the multiplicity and diversity that characterizes the world would be non-existent. (Here and in fragment 6, where the principles are said to be 'neither alike nor related', Philolaus may be polemicizing against the Eleatic arguments of Parmenides (§§4-8) and Melissus (§§2-4), who by postulating a single, uniform and eternally stable being denied all plurality, diversity and change.) Moreover, the possibility of human knowledge depends upon the existence of *both* principles, for 'there will not at all be anything that knows if all things were unlimited' (fr. 3).

Because Philolaus does not supply examples for ‘unlimiteds and limiters’, scholars have conjectured empty spaces and atoms, the even (or unlimited) and odd (or limited) elements of number or material components and their defining shapes, but none of these hypotheses receives unqualified support from the fragments. Possibly Philolaus never intended to define these principles more narrowly, given the epistemological scepticism he expresses at the beginning of fragment 6:

> The being of things, being eternal, and nature itself admit of divine and not human knowledge except that none of the things that exist and are known by us could have come to be if the being of the things from which the cosmos is composed did not already exist, [the being] of both limiters and unlimiteds.

The eternal and essential nature of things, including that of limiters and unlimiteds, ultimately lies beyond human understanding. Limiters and unlimiteds as universal, pre-existing principles have at this pre-cosmic stage an indefinable, abstract quality. But when they are joined in the actual process of forming the cosmos and the things in it, their manifest operation renders them in some sense concrete and knowable. On the best evidence of the fragments, the unlimited and limiting principles and the things composed of them become known through number.

3 Cosmogony and number

‘The cosmos is one’ (fr. 17). Limiters and unlimiteds alone, however, do not suffice to account for the unity of the universe. As opposing principles they need to be joined in order to produce a cosmos, a term that in Greek expresses beauty, order and structure. In a continuation of fragment 6, Philolaus reveals what links the unlimited and limiting principles:

> But since these principles pre-existed and were neither alike nor related it would have been impossible for them to be ordered (*kosmēthēnai*), if harmony (*harmonia*), in whatever way it came to be, had not come upon them. Now like things and related things did not require in addition any harmony, but things unlike and not related… such things must be closely linked by harmony, if they are going to be contained in an order (*en kosmōi*).

With the introduction of *harmonia* (literally, a ‘fitting together’), Philolaus evidences a continuity with those Presocratics who emphasized a bonding force in the universe (see Empedocles §3; Heraclitus §3), and especially with the Pythagoreans for whom *harmonia* was a central tenet (see Pythagoreanism §2). Philolaus is not concerned with fathoming the origin of harmony but simply postulates it as necessary to explain the manifest coherence of things.

While the cosmological significance of harmony as an ordering force is implied throughout fragment 6, its specific application to the generation of the cosmos is made in the next fragment: ‘The first thing fitted together, the One, in the middle of the sphere is called the hearth’ (fr. 7). In Philolaus’ astronomy (see §4) the universe is conceived of as a sphere (the uniform nature of a sphere in which the notions of ‘up’ and ‘down’ are relative is stressed in fragment 17). For the concept of a spherical cosmos Philolaus may have been indebted to Parmenides. But breaking with the geocentric view of the Presocratics Philolaus locates in the middle of the sphere the element of fire, here called the hearth (in Greek domestic and religious culture the burning hearth occupied the centre of households and temples). As the centre of a sphere was considered its ‘origin’, so fire functions as the origin of the cosmos, which develops from the centre outwards. The primacy of fire (which also figures significantly in the philosophy of Heraclitus and Hippasus the Pythagorean), its status as the ‘first thing’ in the cosmos, finds a telling correspondence in Philolaus’ biology, according to which our bodies at the embryonic stage are solely constituted out of the ‘hot’. It was common in Greek thought, especially among medical writers with whom Philolaus shows some acquaintance, to make analogies between the life of humans (or animals) and the larger cosmic organism; in Philolaus, the heat or fire that has such a definitive role in biological generation is likewise the primary element in the formation of the cosmos, the starting point of all generation.

As the central fire is itself a result of harmony, it must then also be a compound of unlimited and limiting things, but the extant fragments again do not specify what these are. The product, however, is clearly a unity, described as ‘the One’. Of the different interpretations concerning the One in fragment 7, the view taken in this entry is that it refers to the number one. In fragment 4 Philolaus states emphatically that ‘all things that are known have number; for it is impossible for anything whatsoever to be understood or known without it’. With this assertion Philolaus places himself squarely in the Pythagorean tradition of number philosophy, although it remains questionable

whether he equated things with numbers as some Pythagoreans apparently did. Without question, however, number plays a crucial epistemological role for Philolaus: things can only be understood by means of number. Philolaus breaks down number into 'two proper kinds, odd and even, and third from a mixture of both of these, even-odd' (fr. 5); of the two proper kinds there are 'many forms, which each thing itself signifies'. This means that individual things in the world are signified by the many forms of number, which are the even and odd natural numbers, while it is implied that there are not many forms of the 'even-odd'; possibly only one. That form of the even-odd would be the One, since the Pythagoreans considered the One to be both odd and even in so far as it originates the number series that must consist of both odd and even numbers. It fits Philolaus' system that he should assign the number one to the 'first thing fitted together'. For things to 'have number' means that they can be known by their mathematical structure. The central fire, a harmonization of limiters and unlimiteds, is thus comprehended by a number that is itself a mixture of unlimited and limited - in numerical terms, of even and odd (the Pythagoreans put even on a par with unlimited and odd with limit). Just as the One stands at the beginning of the number series, so the central fire is the starting point for the development of the universe that, taken as a whole, will also be one (fr. 17), while the constituent bodies of the universe are signified by the numbers deriving from the One. In assigning the One to the central fire Philolaus intimates from the outset the close connection between things and their informing numbers that will remain a permanent feature of the cosmos.

The surviving fragments do not explain how the cosmogonical process continued, but a clue may be taken from passages in Aristotle that appear to be based partly on Philolaus' book. Aristotle reports that immediately after the construction of the Pythagorean One, the unlimited is drawn in and limited by the limit. From this and other Aristotelian accounts the picture emerges of the cosmos as a living organism that breathes in various unlimited stuffs from 'outside the heaven', the locale of all that is infinite. The particular unlimiteds are time, breath and the void (emptiness). Their interaction with the One, which is here given a limiting function, produces an orderly world where bodies (and numbers, spatially conceived) are separated by the interjection of empty space (see Democritus §2) and time is divided into measurable units. Some of this information probably derives from other Pythagorean sources, but that Philolaus subscribed to the general concept of a breathing universe originating from the One is suggested again by his embryology: the living animal, being hot, immediately upon birth draws in cold air from the outside and discharges it again, thus starting the regulated process of respiration (A27). This is paralleled on the cosmic level where the central fire (the hot) draws in and imposes limits on breath (the cold) or the void, which are unlimiteds from outside the universe.

4 Astronomy

The most striking feature of Philolaus' astronomy, as noted in §3, is the location of fire in the centre of the spherical cosmos. It is the hearth of the universe (this is not the sun, which is but one of the orbiting planets - heliocentrism first appears with Aristarchus in the third century BC). Philolaus' departure from the usual geocentric world-view of the Greeks appears to be motivated by Homer's description of Tartarus 'as far below Hades as heaven is from earth' (*Iliad* VIII 16). Although Homer does not associate Tartarus with fire, the ancient Pythagorean idea of a fire in the middle of the earth as well as the volcanic fires of southern Italy would have led Philolaus to postulate a sole central fire, identified with the Tartarus of Greek myth (hence also called the 'prison' or 'defence tower of Zeus' in the Philolaic-Pythagorean tradition). The central fire forms the natural counterpart to the fiery envelope that surrounds the spherical universe at its uppermost boundary (A16). In between and revolving around the central fire, apparently at decreasing velocities, are ten astronomical bodies in the following order: counter-earth; earth; moon; sun; the five planets (in no specified order); and the fixed stars. The counter-earth was not simply introduced, as Aristotle charges, to bring the number of all the planets up to the perfect Pythagorean ten. Rather, Philolaus seems to have posited it as a kind of earth in reverse, the world of the dead, and identified it, again according to the Homeric model, with the invisible Hades of Greek myth. Because it could not be seen, he theorized that the earth in its orbit rotates only once on its axis (this itself was to prove a fruitful idea in the history of astronomy), thus keeping its inhabited side turned away from the centre and rendering the counter-earth invisible. There are also indications that Philolaus shared the belief that the earth moved in an inclined orbit (ellipsis) to account for the different altitudes of the sun and the change of seasons. Other astronomical theories held by Philolaus deal with the periodic destruction of the earth, or parts of it, by fire and water (A18), the nature of the sun (which is like a glass reflecting the light and heat of the central fire) (A19) and the inhabitants of the moon (A20).

Philolaus' astronomy thus combines elements of inventive theorizing based on myth (the central fire, the counter-earth) with empirical data concerning celestial phenomena (night and day, the four seasons, etc.) to yield an orderly cosmos. Obviously, his astronomy must be appreciated within the context of the fifth century BC in which the progressive thought of the day was an amalgam of elementary scientific observations, philosophical preconceptions and mythological remnants.

5 Miscellanea

The discovery, attributed to Pythagoras, that the concordant intervals that make musical harmony possible could be expressed by certain numerical ratios, found a cosmic application in Pythagoreanism: 'the whole universe is harmony and number' (see Pythagoreanism §2). It is not surprising, therefore, that Philolaus, after describing the cosmic role of *harmonia* (fr. 6), constructs a diatonic scale to account for 'the size of harmony', incorporating the basic Pythagorean ratios of octave ($2:1$), the fifth ($3:2$) and the fourth ($4:3$) (fr. 6a). One significance of Philolaus' musical theory is that it may lie at the basis of Plato's account of the ratios comprising the structure of the world-soul (*Timaeus* 34b).

Philolaus also called the human soul a harmony (A23). Some scholars have argued that this isolated testimony is based on an inference from Plato's *Phaedo*, where the soul as a harmony of opposites is presented as a Pythagorean teaching, and is therefore spurious. But in the light of the pre-eminent role that Philolaus assigns to harmony, it is reasonable to assume that he would have brought this universally important concept to bear on any particular discussion of the soul.

Further interests of Philolaus concerned biology and medicine, but it is not known to what extent he wrote about these topics. Of his views on embryology and disease we have a single report (A27). Philolaus believed that the embryo is innately hot, because both sperm and the womb in which it is deposited are hot. Immediately at birth, 'the hot' inhales cold air from the outside and emits it again 'like a debt'; the process of respiration is presented as necessary for the cooling of the body. Diseases originate from bile, blood, and phlegm.

Philolaus posited four physiological principles, classified as follows:

> The head is the seat of intellect, the heart of life and sensation, the navel of rooting and first growth, the genitals of the sowing of seed and generation. The brain is the origin of man, the heart the origin of animals, the navel the origin of plants, the genitals the origin of all (living things). For all things both flourish and grow from seed.
>
> (fr. 13)

By locating intellect in the head, Philolaus differs from those Presocratics who associated thinking with the heart (for example, Empedocles). Another noteworthy detail is that Philolaus distinguishes between thought and sensation; this distinction was to be developed and clarified by Plato, who in the *Timaeus* also located psychic functions in different parts of the body. Overall, Philolaus' fourfold division of faculties, neatly applied in a hierarchical fashion to humans, animals, plants and all organisms, manifests the Pythagorean, and generally Presocratic, impulse to detect the order and structure by which the multiplicity of the world's phenomena can be comprehended.

Philoponus (*c.* AD 490-*c.*570)

John Philoponus, also known as John the Grammarian or John of Alexandria, was a Christian philosopher, scientist and theologian. Philoponus' life and work are closely connected to the city of Alexandria and its famous Neoplatonic school. In the sixth century, this traditional centre of pagan Greek learning became increasingly insular, located as it was at the heart of an almost entirely Christian community. The intense philosophical incompatibilities between pagan and Christian beliefs come to the surface in Philoponus' work.

His œuvre comprised at least forty items on such diverse subjects such as grammar, logic, mathematics, physics, psychology, cosmology, astronomy, theology and church politics; even medical treatises have been attributed to him. A substantial body of his work has come down to us, but some treatises are known only indirectly through quotations or translations. Philoponus' fame rests predominantly on the fact that he initiated the liberation of natural philosophy from the straitjacket of Aristotelianism, through his non-polemical commentaries on Aristotle as well as his theological treatises deserve to be appreciated in their own right.

Philoponus' intellectual career began as a pupil of the Neoplatonic philosopher Ammonius, son of Hermeas, who had been taught by Proclus and was head of the school at Alexandria. Some of his commentaries profess to be based on Ammonius' lectures, but others give more room to Philoponus' own ideas. Eventually, he transformed the usual format of apologetic commentary into open criticism of fundamental Aristotelian-Neoplatonic doctrines, most prominently the tenet of the eternity of the world. This renegade approach to philosophical tradition, as well as the conclusions of his arguments, antagonized Philoponus' pagan colleagues; they may have compelled him to abandon his philosophical career. Philoponus devoted the second half of his life to influencing the theological debates of his time; the orthodox clergy condemned him posthumously as a heretic, because of his Aristotelian interpretation of the trinitarian dogma, which led him to enunciate three separate godheads (tritheism).

The style of Philoponus' writing is often circuitous and rarely entertaining. However, he combines an almost pedantic rigour of argument and exposition with a remarkable freedom of spirit, which allows him to cast off the fetters of authority, be they philosophical or theological. Although his mode of thinking betrays a strong Aristotelian influence, it also displays a certain doctrinal affinity to Plato, stripped of the ballast of Neoplatonic interpretation. His works were translated into Arabic, Latin and Syriac, and he influenced later thinkers such as Bonaventure, Gersonides, Buridan, Oresme and Galileo.

1 The grammarian and commentator

In order to appreciate the magnitude of Philoponus' achievement as a philosopher, one has to consider briefly the background. One common way for philosophers in late antiquity to develop and communicate their ideas was the composition of commentaries on classical philosophical authors such as Plato and Aristotle. Generations of commentaries were written from the time of Alexander of Aphrodisias (early third century AD) to the seventh century and later, forming a massive tradition. Many of these works evolved out of the school practice of the Neoplatonists (see Neoplatonism §1) and conformed to several requirements: (1) the commentaries consisted of an extremely detailed oral exegesis of a philosophical text, designed for the benefit of students; (2) not uncommonly, pupils were responsible for taking verbatim notes of their teachers' instruction, thus turning the lecture into a book; (3) each commentary constituted a step within a substantial curriculum of philosophical training which began with Aristotle and aimed at progressing towards Plato - a commentator was expected to demonstrate the agreement between Plato and Aristotle, indeed, to show forth the harmony among all ancient philosophers including Homer; and (4) philosophy in this way was viewed as education as much as pagan religious exercise by which human beings could perfect their intellect and character with a view to 'becoming godlike as far as possible'.

After a basic education in grammar Philoponus, who was probably born into a Christian family, embarked on this curriculum. As a pupil of Ammonius, son of Hermeas, he assumed responsibility for writing down the lectures of the school's ailing head: the commentaries on Aristotle's *On Generation and Corruption*, *On the Soul*, *Prior Analytics* and *Posterior Analytics* explicitly state in their titles that they are 'based on Ammonius' seminars'. The commentaries on the *Categories*, the *Physics* and the *Meteorology* do not make such claims, which suggests, in conjunction with other evidence, that Philoponus was teaching these courses himself. Presumably succeeded Ammonius at some point, although he never held the chair of philosophy but remained *grammatikos*, professor of

philology. After the death of Ammonius, the school's leadership seems to have passed into the hands of the mathematician Eutocius and then on to the philosopher Olympiodorus, who was pagan.

In many ways, Philoponus' commentary on the *Categories* may be regarded as typical of its kind. The exegesis of Aristotle's text is prefaced by a general clarification of matters of interest to the student reading philosophy for the first time. Beginners were first instructed in Aristotle's logical works, arranged according to the principle of increasing complexity: the *Categories*, dealing with simple utterances, were followed by the *De interpretatione* (on propositions), the *Prior Analytics* (on syllogisms) and the *Posterior Analytics* (on proof). Discussing the problem of the subject matter (*skopós*) of the *Categories* (see Aristotle §7), Philoponus says that the *Categories* are about simple utterances (*phōnai*) signifying simple things (*pragmata*) by means of simple concepts.

As opposed to the Stoics, Neoplatonists followed Alexander of Aphrodisias in regarding logic not as a separate philosophical discipline but as philosophy's tool, its *Órganon*. In their commentaries on the *Prior Analytics*, both Philoponus and Ammonius attempt to reconcile the two positions.

The contemporary Athenian Neoplatonist Simplicius, who spent much time repudiating Philoponian ideas, doubted Philoponus' competence as a logician, and modern scholars tend to agree with him. Historians of logic, however, acknowledge that Philoponus was the first to render a satisfactory definition of the syllogism which states that the major premise includes the predicate term of the conclusion, the minor premise the subject term *On Aristotle's Prior Analytics* 67). In Philoponus, one also encounters for the first time the schematic diagram facilitating the construction of valid syllogisms, later termed by the schoolmen *pons asinorum* (*On Aristotle's Prior Analytics* 274).

The commentary on Aristotle's *On the Soul* is perhaps the earliest commentary to contain passages in which Philoponus abandons proper exegesis in order to modify or criticize Aristotelian doctrine, a tendency even more conspicuous in the *Physics* commentary, which can be dated to 517. It is convenient to distinguish between two kinds of criticism: substantial modification of Aristotelian ideas on the one hand, outright rejection on the other. Philoponus' commentary *On the Soul* presents a good example of the first kind of criticism. In *On the Soul* (II 7) Aristotle understood light as incorporeal and described its appearance as an instantaneous transition from the potentiality (*dýnamis*) of a medium to be transparent to the actuality (*enérgeia*) of transparency. The description fails to account both for the laws of optics and for the phenomenon that the region below the moon is warmed by the light of a celestial body, the sun. Philoponus proceeds to interpret the term *enérgeia* not as an actual state but as an 'incorporeal activity' which is capable of warming bodies, just as the soul is in the case of animals. Due to this shift of terminology, light is now understood as dynamic. It is possible to trace Philoponus' further development of the idea: in the *Meteorology* commentary, which belongs to a stage when Philoponus had already abandoned the assumption of an immutable celestial element (*aithēr*), he argues that light and heat may be best explained as consequences of the nature of the sun, which is fire. Heat is generated when the rays emanating from the sun are refracted and warm the air through friction.

2 The grammarian and commentator (cont.)

Philoponus' commentary *On Aristotle's Physics* contains an array of examples of innovative and critical commentary. One of his most celebrated achievements is the theory of impetus, which is commonly regarded as a decisive step from an Aristotelian dynamics towards a modern theory based on the notion of inertia. Concepts akin to impetus theory appear in earlier writers such as Hipparchus and Synesius, but Philoponus never mentions them. As far as one can tell from the text (*On Aristotle's Physics* 639-42), his point of departure is an unsatisfactory Aristotelian answer to a problem that was to puzzle scientists for centuries: why does, for example, an arrow continue to fly after it has left the bowstring? Since Aristotle supposed that (1) whenever there is motion there must be something which imparts the motion, and (2) mover and moved must be in contact, he was led to conclude that the air displaced in front of the projectile somehow rushes round it and pushes from behind, thus propelling the projectile along. This theory was still in vogue among Aristotelians of the sixteenth century, despite the fact that a thousand years earlier Philoponus had demolished it. He proposed instead that a projectile moves on account of a kinetic force impressed on it by the mover, which exhausts itself in the course of the movement. Philoponus compares this 'incorporeal motive *enérgeia*', as he calls it, to the activity earlier attributed to colour and light.

Once projectile motion was understood in terms of an impetus in this way, it became possible to reassess the role

of the medium: far from being responsible for the continuation of a projectile's motion, it in fact impedes it (*On Aristotle's Physics* 681). Against Aristotle Philoponus concludes that there is in fact nothing to prevent one from imagining motion taking place through a void. As regards the natural motion of bodies falling through a medium, Aristotle's verdict that the speed is proportional to the weight of the moving bodies and indirectly proportional to the density of the medium is disproved by an experiment similar to that which Galileo was to carry out centuries later (*On Aristotle's Physics* 682-4).

Philoponus' impetus theory ties in with wider criticisms of Aristotelian principles of physics. Aristotle had dismissed the notion of a void as an incoherent logical impossibility. Philoponus concedes that in nature empty spaces never become actual, but he insists that a clear conception of the void is not only coherent but also necessary if one wants to explain movement in a plenum (the place-swapping of bodies presupposes that there is empty space to be filled; *On Aristotle's Physics* 693-4) or such phenomena as the force of the vacuum (571-2). Philoponus' elaborate defence of the void (675-94) is closely related to his conceptions of place and space (*On Aristotle's Physics* 557-85). Aristotle defined the place of a body as the inner surface of the body that contains it (*Physics* IV 4); Philoponus replies that place ought to be conceived as the three-dimensional extension equal to the determinate size of the body, that is, its volume. Likewise, space is indeterminate pure three-dimensional extension devoid of body. It is not infinite, however, but coextensive with the size of the universe.

Philoponus' discussion of matter dovetails well with this conception of space. In the commentary *On Aristotle's Physics* (687-8) he argues in a vein similar to Aristotle in *Metaphysics* (VII 3). In abstracting all qualities from body Aristotle arrived at prime matter, which the Neoplatonists later defined as incorporeal and formless. Philoponus, in contrast, arrives at something he calls 'corporeal extension', which is a composite of prime matter and indeterminate quantity and must not be confused with space. His argument here may still be regarded as elaboration on Aristotle. However, in book XI of the polemical treatise against Proclus (see §2), he rejects the Aristotelian-Neoplatonic conception of prime matter and lets the most fundamental level of his ontology be constituted by 'the three-dimensional', indeterminate corporeal extension. In this he claims to be following the Stoics; this lowest ontological level is reminiscent of the Cartesian *res extensa*, although Descartes would not permit the distinction between space and corporeal extension (see Stoicism §3; Descartes, R. §11).

In order to rebuff the likely objection that the three-dimensional cannot be the most fundamental level of being because extension, belonging to the category of quantity, is an *accident* and requires the assumption of an underlying *subject*, Philoponus argues that extension is in fact an essential and inseparable differentia of the three-dimensional, just like heat in fire or whiteness in snow. Thus quantity is constitutive of body as such, which amounts to a promotion of quantity to the category of substance. There are indications that Philoponus would have modified Aristotle's scheme of the *Categories* if he had revised his early commentary on that treatise.

The incomplete commentary on the *Meteorology* may well be the last commentary Philoponus wrote on Aristotle. It is worth noting how the lectures are presented, with an air of aloofness and, at times, deliberate vagueness. In several places, especially when he has to comment on the nature and movement of the heavens, Philoponus breaks off and refers the student to previously published work: what Philoponus *really* has to say about the text seems no longer appropriate for the classroom. He has successfully shaken off the weight of Aristotle's and anyone else's authority, and far from demonstrating the harmony among philosophers he himself contributes to their dissent. The commentator has turned into a critic.

3 The critic

In the fifth century, the Athenian Neoplatonist Proclus wrote a defence of the pagan Greek belief in the eternity of the world. His aim was to show that Christian creationism was intellectually untenable. Eighteen arguments were loosely grouped around the myth of Plato's *Timaeus*, which, according to Proclus, was consistent with an eternalist reading.

In 529, when the Emperor Justinian suppressed pagan philosophy in Athens, Philoponus published a reply entitled *On the Eternity of the World against Proclus*. The book is something like an anti-commentary to the Proclean arguments. Combing through the text Philoponus repudiates literally every single point made by Proclus. Although his efforts are evidently motivated by faith, he keeps Biblical theology out of his polemic, attempting to refute Proclus solely within the framework of Platonism. The *Timaeus* is read as a genuine account of creation, and a

fresh analysis of the processes of generation and corruption even renders viable an idea which Greek philosophers never allowed: creation out of nothing. Even if it were true that creation out of nothing never occurs in nature, Philoponus argues, God is surely more powerful a creator than nature and therefore capable of it.

Philoponus' battle against eternalism may be divided into three different stages. The first, the work against Proclus, is followed by a second and even more provocative publication, *On the Eternity of the World against Aristotle*. This work was published *c.*530-4 and involved a close scrutiny of the first chapters of Aristotle's *On the Heavens* (on the theory of aether) and the eighth book of the *Physics* (on the eternity of motion and time). The third stage is represented by one, perhaps two non-polemical treatises in which arguments against eternity and for creation were arranged in systematic order.

Like the polemic against Proclus, that against Aristotle is mainly devoted to removing obstacles for the creationist. If Aristotle were right about the existence of an immutable fifth element (*aithēr*) in the celestial region, and if he were right about motion and time being eternal, any belief in creation would surely be unwarranted. Philoponus succeeds in pointing to numerous contradictions, inconsistencies, fallacies and improbable assumptions in Aristotle's philosophy of nature. Dissecting the text in an unprecedented way, he consistently refutes Aristotle's arguments and so paves the way for demonstrative arguments for non-eternity. One such argument (fr. 132) reported by Simplicius (*On Aristotle's Physics* 1178.7-1179.26) relies on three premises: (1) if the existence of something requires the pre-existence of something else, then it will not come to be without the prior existence of the other; (2) an infinite number cannot exist in actuality, nor be traversed in counting, nor be increased; and (3) something cannot come into being if its existence requires the pre-existence of an infinite number of other things, one arising out of the other. From these not un-Aristotelian premises, Philoponus deduces that the conception of a temporally infinite universe, understood as a successive causal chain, is impossible. Furthermore, given that the spheres have different periods of revolution, the assumption of their motion being eternal would lead to infinity being increased, even multiplied, which Aristotle thought absurd.

The non-polemical treatises exploit, among others, Aristotle's argument that an infinite *dýnamis* cannot reside in a finite body (*Physics* VIII 10); Philoponus infers that since the universe is finite, it cannot have the *dýnamis* to exist for an infinite time. As in the case of the theory of light, this argument involves a shift of meaning. In the context of Aristotle's prime mover argument, *dýnamis* meant 'kinetic force'; Philoponus, however, uses the word in the sense of 'existential capacity' or 'fitness'.

By the end of the 530s Philoponus seems to have stopped producing philosophical works; for reasons on which one can only speculate, his career as a philosopher was over.

4 The theologian

Since there is no evidence that John Philoponus belonged to a clerical order, it is difficult to picture his professional life as a theologian. He published his theological treatises under the same name as before, *Iōánnēs grammatikós*, but it seems hard to imagine him as a professor of grammar. Likewise, his nickname *philóponos* (lover of work) is probably best interpreted as an acknowledgement of his literary productivity, not as an indication of his status as one of the Christian brethren in Egypt who called themselves by that name.

Perhaps some fifteen years after his attack on Aristotle, Philoponus published the Creation story, *On the Creation of the World (De opificio mundi)*, his only theological work extant in Greek. While discussing the biblical text Philoponus frequently refers to philosophers such as Aristotle, Plato and Ptolemy as well as to Basil the Great, whose own treatise on the Creation served as his inspiration (see Creation and conservation, religious doctrine of). The treatise has received some attention from historians of science, because Philoponus suggests at one point (I 12) that the movement of the heavens could be explained by a 'motive force' impressed on the celestial bodies by God at the time of creation. Philoponus had discussed impetus theory for the first time in the context of forced motion (see §2); now he applies the theory to the universe at large. Significantly, Philoponus compares the rotation imparted to the celestial bodies to the rectilinear movements of the elements as well as to the movements of animals: they are all brought about by the creator's divine impetus. Due to this suggestion Philoponus is often credited with having envisaged, for the first time, a unified dynamic theory, striving to give the same kind of explanation for phenomena which Aristotle had to explain by various different principles.

Judging from the fragmentary evidence, Philoponus' later theological treatises are characterized by a curious

mixture of Christian piety and Aristotelian philosophy. On the eve of the fifth Council (Constantinople 553), Philoponus stepped forward as a partisan of monophysite Christology which, in the course of the century, had become increasingly influential in the eastern part of the empire. The monophysites, who emphasized the divinity of Christ, were scandalized by the conjunction of Christological formulas enunciated at the Council of Chalcedon in 451. There Christ was confessed to be: (1) consubstantial (*homooúsios*) with the Father; (2) consubstantial with humans; (3) one person and one *hypóstasis* ('existence'); and (4) 'discernible in two natures', a phrase referring to the '*unitatem personae in utraque natura intelligendam*' endorsed by the Bishop of Rome and familiar to theologians of the Latin West. Although propositions (1), (2) and (3) were no longer controversial, proposition (4) could be read as an unholy concession to those who regarded Jesus merely as a divinely inspired man. In addition, how could it be sensible to predicate two entirely different natures of a single entity?

In the *Arbiter* Philoponus takes the view that the phrase 'in two natures' ought to be abandoned. His main strategy is to argue that in this context the meaning of the terms 'nature' and '*hypóstasis*' is virtually identical. 'Nature' has two senses, one general, one particular - we can speak of the nature of man in general or of the nature of this individual man. When one speaks of the unification of two natures in Christ, the reference cannot be to the universal natures of godhead and manhood (otherwise it would be true to say that the Father and the Spirit have also become man, since the universal nature of 'godhead' applies to them as it does to the Son). Hence, the reference must be to the particular nature of the Logos and the particular nature of Jesus the man. But 'particular nature' is virtually the same as *hypóstasis*, which Philoponus uses also as a synonym of 'person' and 'individual'. Since it is agreed that Christ is one person and *hypóstasis*, he must consequently be of one nature, albeit a complex one which combines and preserves the properties of both god and man: 'one composite nature' (*mía phýsis sýnthetos*).

Besides monophysitism Philoponus' name is associated with the precarious doctrine of tritheism. However, there is an important difference: whereas monophysitism was a reputable and powerful movement among Eastern theologians, tritheism is merely a hostile label attached to those who were not afraid to render the mystery of the Trinity intelligible by drawing some clear distinctions. Already in the *Arbiter* it became clear that Philoponus associated with the term *hypóstasis* something like 'primary substance' in the Aristotelian sense (see above). The fragments of the very late treatise *On the Trinity* confirm this: since *hypostasis* is certainly not an accident of divinity, it must be the case that the three *hypostases* of the Trinity are three divine substances with distinct properties. Only on this assumption, too, is it reasonable to speak of consubstantiality: if there were only *one* divine substance, what could it mean to say that it is consubstantial with itself? When the Cappadocians spoke of the Trinity as 'one substance (*ousia*), three *hypostases*', they were not, Philoponus argues, enunciating a fourth primary substance, but using 'substance' in the secondary, abstract sense. In accordance with Aristotle Philoponus goes on to claim that universals exist only in the human mind, thus reducing monotheism apparently to a mere concept. In order to refute any reminiscences of pagan polytheism Philoponus points out that, unlike the gods of the pagans, the three divinities of the Trinity are all of the same divine nature (in the universal sense).

Philoponus had followers, but this kind of trinitarian philosophy was unacceptable to anyone not committed to Aristotle's ontology. And so, the so-called tritheists faced immediate and severe criticism; Philoponus himself was condemned (posthumously) by the Council of Constantinople in 680/1. It is often stated that Philoponus was one of the first thinkers to reconcile Aristotelian philosophy with Christianity; his contemporaries probably took a different view. Pagan philosophers certainly abhorred the way in which Philoponus used Christianity as a vantage point from which to disturb the harmony of the wise, and Christian theologians could not but castigate his dubious attempt at comprehending a spiritual mystery by making it conform to Aristotle.

5 Influence

In addition to inciting the disapproval of his contemporaries, both pagan and Christian, Philoponus' immediate influence may have been considerable among fellow monophysites in Egypt, but his condemnation as a heretic in 681 made the further proliferation of his theological ideas impossible. Likewise, his arch enemy Simplicius, also a pupil of Ammonius, son of Hermeas, submitted Philoponus' anti-eternalism almost immediately to thundering polemic which resounded through the centuries with the effect that later thinkers like Thomas Aquinas and Zabarella underestimated Philoponus in general. Although his work was studied by the Arabs, who referred to him as Yahya an-Nahwi or Yahya al-'Asqalani, they too tended to side with Aristotle. However, the arguments against

eternity eventually persuaded Bonaventure and Gersonides, and impetus theory was reaffirmed by Buridan and his pupil Oresme. In the sixteenth century, the first editions and numerous translations (into Latin) of Philoponus' commentaries and the treatise against Proclus began to appear in print. In particular his criticism of Aristotle in *On Aristotle's Physics* was widely discussed and persuaded such diverse thinkers as Giovanni Pico della Mirandola and, for different reasons, Galileo Galilei.

Photography, aesthetics of

Claims that photography is aesthetically different from and, in many versions of the argument, inferior to the arts of painting and drawing have taken various forms: that photography is a mechanical process and therefore not an artistic medium; that it is severely limited in its capacity to express the thoughts and emotions of the artist; that its inability to register more than an instantaneous 'slice' of events restricts its representational capacity; that it is not a representational medium at all. Some of these arguments are thoroughly mistaken, while others have an interesting core of truth that will emerge only after some clarification. Central to this clarification is an account of the precise sense in which photography is mechanical, and an explication of our intuition that a photograph puts us 'in touch with' its subject in a way that a painting or drawing cannot. Both these ideas need to be separated from the mistaken view that it is the nature of photography to provide images that are superlatively faithful to the objects they represent. Throughout this entry we shall consider only the case of photographs of a relatively unmanipulated kind, ignoring darkroom techniques that blur the distinction between photography and painting.

1 The supposed limitations of photography

Photography and the traditional forms of image-making - painting and drawing - differ in important ways. Intuitively, a painting can be 'of' something that does not exist (though this idea is hard to make precise in an acceptable way); a photograph can only be of something that actually transmitted light into the mechanism. A photograph can depict more than the artist intended to depict, such as when magnification displays evidence of a crime; a painting records what the artist thought the scene looked like, and the grain of discriminability is set by the artist's own visual acuity and manual skill. Certain kinds of subject seem to have more force or cause more offence when represented photographically; a photograph of martyrdom would be difficult to appreciate aesthetically, whatever its compositional merits. It has not, however, been easy to explain these judgments within a unified theory of the nature and limitations of photography.

One kind of argument for the artistic inferiority of photography depends on claims about the limitations of what photography can convey - limitations which favour the particular, the instantaneous and the visible or surface features of things over the general, the progressive and the hidden aspects, and especially over the underlying emotional and motivational themes. Most of these arguments apply also to painting, an art against which they are rarely directed. It is true that painting can explicitly present a narrative by placing noncontemporaneous events within the same frame, while a photograph of the 'pure' or unmanipulated kind cannot. But even paintings that confine themselves to the depiction of a single moment can draw on beliefs and traditions external to the work to provide narrative force. Photographs can also achieve narrative status by appeal to such sources. It has also been argued that the 'mechanical' nature of the photographic method does not allow significant scope for expressive or intentional qualities. In exactly what sense photography is mechanical is a question we shall examine in detail later on, but any acceptable explication of that notion will surely have to accommodate the fact that some photographs do express beliefs, evaluations and emotions through the evident choices the photographer has made concerning such things as lighting, depth of field, exposure and subject. It may be true that there are fewer choices to be made in determining the visible appearance of a photograph than in determining the visible appearance of a painting, where every brush stroke is, in principle, a matter of independent decision. It does not follow that photography is a less expressive medium than painting. Sometimes the restrictions that an artistic form imposes on its practitioners give a special significance to the choices they are able to make within the constraints imposed. Arguments to the effect that photography is, by its nature, artistically limited are most charitably understood as reactions against the excessively ambitious claims sometimes made on behalf of photography: that it makes representational painting redundant, that it has an unrivalled capacity for documentation, or that it represents the world to us in an undistorted and uninterpreted form.

The claim that photography faithfully reproduces appearance, in the sense that photographs of things are or can be superlative likenesses of them, needs to be distinguished from another thesis with which it is sometimes confused: that photography mechanically reproduces the appearances of things. Both these claims have been used to advance a further claim: that photography gives us access to things in the real world rather than providing, as painting does, mere representations of those things. Let us call these claims the likeness thesis, the mechanicity thesis and the reality thesis respectively. Critics of the reality thesis have attacked both the mechanicity thesis and the likeness

thesis. Against the likeness thesis I believe they have been successful, having shown that there is nothing about photography as a medium that makes its products essentially more faithful than painting to visible appearances. Against the mechanicity thesis, however, the critics have been less successful, their efforts having been directed against its naive and implausible versions. But while the mechanicity thesis stands, it provides little support for the reality thesis, as we shall see.

2 Photography as mechanism

Claims that photography is a mechanical medium are common; clear expositions of the thesis are rare. Perhaps the clearest has been offered by Kendall Walton (1984).Compare a painting and a photograph of a rose. In both cases there is a dependence between the appearance of the rose and the appearance of the picture; if the rose had been different in various ways, the picture would have been different, and so, correspondingly, would the viewer's experience of looking at the picture. But there is a difference between the painting and the photograph: the patterns of dependence that hold in the case of the painting hold in virtue of facts about the painter's mental state. If the rose had had more petals, the painting would have shown more - but only because the painter would have mentally registered the greater number and incorporated it into the painting. In testing for dependence in the case of painting, if we vary the appearance of the rose, but hold fixed the painter's beliefs about its appearance, the appearance of the painting does not vary. Things are different with the photograph; holding fixed the photographer's mental state leaves the dependence between scene and photograph intact. Had the rose had more petals, the photograph would have shown more, regardless of whether the photographer noticed their number. A hallucinating painter will paint what they think is there; a photograph will show what is there. Photography is mechanical in that the relevant counterfactuals are independent, in the sense just described, of mental states. Here we shall concentrate on this version of the claim that photography is mechanical.

Having explicated the mechanicity thesis, let us now make the reality thesis comparably plausible and precise. Some versions of the reality thesis seem to assert obvious falsehoods. André Bazin's claim (1967) that 'the photographic image is the object itself' is hard to reconcile with the fact that the Washington Monument and a photograph of it are utterly distinct and possibly very distant from each other in space and time. A better explication is provided once again by Kendall Walton, according to whom photographs are 'transparent': seeing a photograph of X is a case of *really seeing* X, just as seeing X through a window or through a telescope and seeing X's reflection in a mirror are such cases. On the other hand, seeing a painting or drawing of X is not a case of seeing X. Photographs are 'aids to vision', whereas 'handmade' images are ways of representing. Roger Scruton (1981) has likened photography to the artful arrangement of a frame around a street scene; what we see inside the frame may be pleasing, but it is not a representation. It is the same, he says, with the photograph. Scruton is best understood as asserting, not that the photograph of the street is, or contains, the street, but that seeing the photograph is a way of seeing the street. This way of understanding the reality thesis does not require the photograph to be identified with or even overlap with its subject; we may see someone in a mirror without having to suppose that the mirror is part of the person. Nor does it require spatiotemporal proximity between photograph and subject; we now see stars that ceased to exist millions of years ago. It is this version of the reality thesis which I shall consider. I shall call it the transparency thesis.

Let us see how, on Walton's construal, the mechanicity thesis supports the transparency thesis. Recall that the patterns of dependence holding between the rose and the photograph of the rose hold also between the rose and my experience of seeing the photograph of the rose, and that these dependencies hold independently of the beliefs of the photographer. Let us say that in that case my experience of the photograph is 'mechanically dependent' on the state of the rose. By contrast, my experience of looking at the painting of the rose is 'intentionally dependent' on the state of the rose; if we imagine the appearance of the rose to vary but hold fixed the painter's mental states, my visual experience of seeing the painting does not vary. Now consider the case where I directly see a rose in front of my eyes, through a window, through a lens or in a mirror. All these are cases of mechanical dependence; they are also cases of genuinely seeing the rose. Seeing the photograph of the rose shares this mechanical dependence, but seeing the painting of one does not. So seeing the photograph of the rose is to count as genuinely seeing the rose, but seeing the painting is not.

This nexus of views about the mechanicity and transparency of photography has the advantage of not denying certain facts about photography which are sometimes cited in favour of the view that there is not, after all, any

principled difference between photography and other representational media like painting: for example, that people typically choose the subject, location and lighting conditions of the photographs they take, and that these choices can all be made with more or less skill, aesthetic sensibility and expressive effect. While true, these considerations are largely irrelevant to the thesis that photographs are mechanical and transparent. When we look at something with the naked eye, how it looks to us depends on lighting conditions and on spatial relations between the viewer and the object viewed, and we can choose to look at this rather than at that. None of this impugns the claim that seeing things with the naked eye is in a certain sense a mechanical process: that when we look in a certain direction it is not up to us or to anyone else to decide what we see; what we see is determined 'mechanically' by what is in front of our eyes and not by decisions or preferences. Nor is it an objection to the claims of mechanicity and transparency that photographs do not always look very much like - and never look exactly like - the things they are photographs of. A photograph may grossly distort the appearance of a man by being created with the help of a distorting lens. But you can look at a man through a distorting lens, thereby seeing him in a grossly distorted way: you are still seeing the man. Nor need the advocate of mechanicity and transparency deny that skills are exercised in the production of photographs, and that photographs so produced may exhibit these skills.

Does the mechanicity of photography provide a convincing argument for its transparency? Imagine two indiscernible clocks, A and B, where mechanical connection ensures that the time told by the hands of A causally determines the time told by those of B. If I am looking at clock B, then it is true of my current visual state that, if the hands of A told a different time, my current visual awareness of B would have been correspondingly different. And these counterfactuals, we may assume, are independent of the intentions of agents in the sense described above. But my seeing B is not also a case of my seeing A. So mechanicity is not sufficient for transparency.

Walton grants the insufficiency of mechanicity for transparency; there might, he concedes, be a machine which examines objects and churns out linguistic descriptions of them in such a way that there is mechanical dependency between the object and the descriptions produced; but reading the descriptions would not be a case of seeing, or of perceiving in any way, the thing described. What stops reading the description from being a case of seeing the object described is, Walton claims, the lack of relevant similarities between the experience of reading and the experience of seeing the object itself. Here we are close to the assertion that mechanicity and likeness (in some relevant respect) jointly constitute a sufficient condition for transparency. But that is not so: the experience of seeing clock B from our earlier example is, in every relevant respect, very much like the experience of seeing clock A, but seeing clock B is not a case of seeing clock A. This is not to say that the transparency thesis is false, but merely that it is not supported by the mechanicity thesis.

Physis and nomos

In the fifth and fourth centuries BC *a vigorous debate arose in Greece centred on the terms* physis *(nature) and* nomos *(law or custom). It became the first ethical debate in Western philosophy. Is justice simply a matter of obeying the laws, or does it have some basis in nature? If the laws conflict with my natural needs and desires, why should I submit to them? Is society itself 'natural', and what difference might the answer make to our evaluation of it? Both* nomos *and* physis *had their supporters, while some tried to dissolve the antithesis altogether.*

Physis has two principal meanings. It can refer to the cosmic order as a whole, or to the prime constituent(s) of that order: in these contexts it can often be translated as 'reality'. It can also refer to the intrinsic characteristics of a thing, especially a living thing, or to the thing's growth towards these characteristics. This dynamic aspect of *physis* can seem to give it a prescriptive as well as a descriptive force: it is *good* that things grow towards their mature state and achieving it constitutes their flourishing.

Nomos (plural: *nomoi*) can signify both the unwritten customs and the written laws of a society, and sometimes also an unwritten universal law of divine origin. Even when it refers to a custom, its force is always prescriptive: it indicates not merely a practice, but what the majority accepts as the right practice. However, increasing travel and historical researches heightened awareness of how particular *nomoi* differ between cultures and over time, and the consequent sense of their transience prompted growing speculation about their authority.

The debate was entered by playwrights, orators and historians as well as philosophers. In Sophocles' *Antigone* (450-60), the particular laws of the state are opposed to the universal ordinances (*nomima*) of the gods. Normally, however, the contrast was between the *nomoi* of a particular state and the perceived requirements of human nature - a theme so common that sliding from what is right in law to what is right by nature and vice versa became a standard debating move (see Aristotle, *Sophistical Refutations* 173a7-16). One leading supporter of *physis* was Antiphon, who argued that the claims of the laws are generally antithetical to those of human nature, and that the individual's interests will be best served by following the latter when legal punishment can be avoided, especially given the inevitability of nature's reprisals if flouted, compared to the uncertain outcome of a broken law.

Amongst other champions of *physis*, Callicles in Plato's *Gorgias* makes a radical distinction between conventional justice and 'natural justice'. It is a 'law of nature' that the naturally superior should seize political control; they should also freely indulge their physical desires. Such behaviour is only termed unjust and intemperate by a convention of the weak majority. The notion of a 'law of nature' also occurs in Thucydides' Melian dialogue (V 105.1-3), where the Athenians claim that it is simply an empirical fact that the superior power can do what it wishes; considerations of justice are only relevant among equals. Thrasymachus, however, in Plato *Republic* I, holds that justice is the invention of those in power: they make the laws in their own interests and call obedience to these laws 'justice'. The prudent will on the contrary further their own interests, acting unjustly where necessary. This position is stated in terms of the *nomos*/*physis* debate at *Republic* 359c.

Underlying all these differing positions is a view of humanity as naturally in conflict. The same premise, however, was also employed by supporters of *nomos*, such as Critias and Protagoras (§§2-3). Both argue that without *nomos* life would be chaotic, brutish and short: humans cannot survive unless they live in societies, and societies cannot exist without an agreed moral code. Protagoras, however, seems to offset people's natural aggression with their innate capacity to absorb social training. Democritus (§5) further advocates that people internalize the *nomoi* of society so that these become the *nomos* of the soul.

Protagoras' position has links with the social contract theories prevalent during this period (see, for example, the celebrated position put forward by Glaucon in Plato's *Republic* 358e-359b). In Plato's *Crito*, Socrates argues that each citizen, by freely electing to remain in their city and receive the benefits of its protection, has made an implicit contract to abide by its *nomoi*. Perhaps the strongest defence of *nomos*, however, comes with Plato and Aristotle, who in different ways seek to dissolve the *nomos*/*physis* antithesis by claiming that receptivity to *nomoi* is an essential aspect of human *physis*.

The debate had important political implications. Each term was used to serve both oligarchic and democratic causes. Traditionally *physis* had been employed by aristocrats to support the notion of a superior class naturally

fitted to rule, but by the late fifth century BC appeals to *physis* were also being used to question the social hierarchy. Antiphon claimed that there was no natural distinction between the high- and low-born, or between Greek and non-Greek, and in the mid fourth century Alcidamas attacked as unnatural the institution of slavery. But the defenders of these social distinctions also appealed to *physis*, as Aristotle does regarding slavery in *Politics* book I.

The liberal deployment of *physis* was associated with the democratic belief that human excellence (see Aretē) could be taught through immersion in the *nomoi* of the state, rather than being acquired through aristocratic inheritance. The supremacy of written *nomoi* was also upheld by democratic supporters, while oligarchs increasingly claimed backing from the controversial unwritten *nomoi*.

Issues of epistemology and language were also embraced. Democritus claimed that sensible properties exist only by convention, while in Plato's *Cratylus* it is considered whether there is a 'natural name' for each thing, or whether this too is a matter of *nomos* (see Language, ancient philosophy of). Nor were the gods above scrutiny: a fragment of the lost play *Sisyphus* (possibly by Critias) argues that the gods are a political invention to promote social control.

The debate raises tough philosophical problems. Is the derivation of an ethical prescription from appeals to nature legitimate? (See Naturalism in ethics.) Some scholars hold that the teleological connotations of *physis* make such a derivation at least plausible. Again, can human nature even be distinguished from *nomos*, either conceptually or in practice?

Despite such difficulties, the debate initiated an important tradition in ethical and political thought which required that perceived human needs and desires at least be taken into consideration, even if they are ultimately to be transcended.

Piaget, Jean (1896-1980)

The Swiss psychologist Jean Piaget was the founder of the field we now call cognitive development. His own term for the discipline was 'genetic epistemology', reflecting his deep philosophical concerns. Among Piaget's most enduring contributions were his remarkably robust and surprising observations of children. Time after time, in a strikingly wide variety of domains, and at every age from birth to adolescence, he discovered that children understood the world in very different ways from adults.

But Piaget was really only interested in children because he thought they exemplified basic epistemological processes. By studying children we could discover how biological organisms acquire knowledge of the world around them. The principles of genetic epistemology could then be applied to other creatures, from molluscs to physicists. Piaget's other enduring legacy is the idea that apparently foundational kinds of knowledge were neither given innately nor directly derived from experience. Rather, knowledge was constructed as a result of the complex interplay between organisms and their environment. Piaget saw this view as an alternative to both classical rationalism and empiricism.

1 The stages of development

Piaget described development as a series of wide-ranging stages. At each stage children had quite different basic logical and representational capacities, which underpinned all their behaviour. Infants initially arrived in the world with nothing but motor reflexes and sensory systems. During infancy they elaborated these basic capacities into complex contingent instructions for behaviour, which related actions and sensations. Piaget called these 'sensori-motor schemas'. Infants could make substantial progress even within this apparently limited framework. They learned a great deal about objects, space, action and causality. Nevertheless, there were, quite literally, no representations of the world in infancy, and no conception of a world independent of the infant's experience. There were only instructions for action.

Piaget defended this position with examples of apparently peculiar and irrational behaviour in infancy. One set of examples involved infants' attempts to obtain interesting objects. Six month-old infants behaved as if objects that disappeared under a cloth no longer existed. If they were in the midst of reaching for an object and it was hidden under a cloth, they would give up their attempt to get it. Later, they learned that pulling the cloth would make the object reappear. But if the object was hidden under one cloth and then under another they would continue to search under the original cloth. Similarly, 9-month-olds who learned to pull a blanket towards them to get an object on top of the blanket would continue to do so even when the object was placed to one side of the blanket.

Children only developed the capacity to represent the external world symbolically at about 18 months. This new kind of representation was reflected in the development of language, pretend play and deferred imitation. These symbolic representations also allowed children to understand that there was a world independent of their experience of it. And they enabled children to solve problems 'in their heads', without actually having to act on the world.

These representations, however, initially had little logical or causal structure. They were 'pre-operational'. As a result preschool children were unable to perform even simple logical and causal reasoning. When they were asked to explain natural phenomena they resorted to animistic explanations, or to explanations in terms of their own desires, and they might reverse cause and effect. For example, a 3-year-old child who was asked why it got dark at night might reply that it got dark because we need to sleep or because you could not see then. Similarly, preschool children were unable to understand even simple logical principles such as the law of transitivity. If they were told that stick *A* was longer than stick *B* and stick *B* than stick *C*, they might still deny that *A* was longer than *C*. Finally, these very young children showed little understanding of hierarchical relationships, such as class-inclusion. If you showed them an array of four red flowers and two white ones, they would report that there were more red flowers than flowers.

At about 6, children did begin to use causal and logical reasoning. These kinds of reasoning were, however, initially closely tied to the perceptual appearances of objects. They were 'concrete operational'. The most famous examples of this involved 'conservation'. In a conservation task the properties of objects remain the same in spite

of transformations of the object's appearance. In a classic experiment, Piaget showed children a tall, thin glass of water, poured the water into a short, wide glass and asked children whether there was the same amount of water, more, or less. Seven-year-olds consistently said that there was less water in the short glass, even after the water was poured back and forth from glass to glass. The children were unable to use information about relations among objects and transformations of objects to override perceptual information about the features of objects.

Piaget thought concrete operations were reflected in the child's understanding of psychological states as well as physical objects. Just as school-age children were unable to coordinate different perceptual appearances, they were unable to coordinate their own experiences and those of others (see Mind, child's theory of). They were 'egocentric'. If 7-year-olds were shown a complex scene from one perspective, they could not project how the scene would look to another person at a different viewpoint. Similarly, in moral reasoning children calculated harm by looking at the actual amount of damage that was caused, without considering intention or motivation (see Moral development). Only at adolescence, in the stage of formal operations, did children become able to use logical and scientific reasoning in a way that was fully abstracted from the details of their own experience.

2 The mechanisms of development

Piaget rejected both the classical developmental mechanisms of nativist views, such as maturation, and those of empiricist views, such as association or reinforcement. Moreover, he also rejected, or at least underplayed, the influence of language and social interaction. Instead he proposed three very general mechanisms of development, all involving an interaction between the knowledge the child had already developed and new information from the outside world. Piaget called his overall view of development 'constructivism'.

Assimilation. The child adapted and interpreted information from the world to fit his existing schemas. The manifestations of assimilation ran from a newborn who generalized his sucking reflex from a nipple to a rattle, to a preschool child who used blocks as dolls in her pretend play, to a school-age child in a conservation task who simply misreported counter-evidence to his claims about the water.

Accommodation. The opposite effect took place: the child was forced to adapt his schemas to fit new information from the world. Again these effects could vary from an infant who had to change his style of sucking to accommodate the unyielding rattle, to a preschool child who imitated her mother's phone conversation in an initially uncomprehending way, to a child in a conservation task who at least temporarily admitted that the same water was in both glasses.

Equilibration. This really represented a kind of balance between assimilation and accommodation. When the child's representations and the evidence from the world matched, the process of accommodation and assimilation would end and the child could at least temporarily settle on a particular kind of representation. Piaget saw cognitive development as a highly dynamic process, constantly balancing representations that had already been constructed with new input from the outside world.

Moreover, the child's active attempts to interact with the world were the basic motor driving this dynamic process. Assimilation and accommodation could work only if the child were engaged with the world, usually by physically acting on it. Piaget sometimes illustrated the mechanisms with the biological example of an animal literally assimilating part of its environment by eating it, and literally accommodating the food by physically changing its body as a result.

3 Piaget's influence

Much of Piaget's most significant work was produced in the 1920s and 1930s in Geneva. But Piaget, like the Gestalt psychologists, remained largely unknown in the United States during the long reign of behaviourism (see Behaviourism, methodological and scientific; Gestalt psychology). However, a few Piagetians, like Gestaltists, came to America after the war, and kept the tradition alive in small enclaves in liberal arts colleges. In the 1960s Piaget was rediscovered in the United States and fully translated into English. His rediscovery was itself both a consequence and a cause of the 'cognitive revolution' in psychology. Piaget was one shining example of how you could construct an account of the mind that was mentalistic, but that also emphasized the biological foundations of psychology. Unlike earlier psychologists such as Brentano and Wundt, but like Chomsky and the early computationalists, he detached the idea of mentalistic explanation from phenomenology (see Mind, computational

theories of; Unconscious mental states).

Moreover, Piaget's work led to the recognition that developmental questions were of broad interest and importance in psychology (until the 1960s much developmental psychology was located in home economics departments). Piaget also had a strong influence on education, particularly on 'progressive' educational theory and practice.

4 After Piaget

Where does the theory stand now? Most of Piaget's actual observations, often based only on pen and paper notes of a few children, have held up remarkably well. On the other hand, new techniques have given us a much broader additional database. Most often, the new data suggest that children are more competent and sophisticated in their understanding of the world than Piaget supposed. These new observations have led most cognitive developmentalists to reject the details of Piagetian theory (see Cognition, infant; Cognitive development).

In particular, the idea of broad-ranging stages of development has come under increasing attack. Instead, cognitive development appears to be quite specific to particular domains of knowledge. For example, the infant who fails to understand object permanence may show a sophisticated and clearly representational understanding of object movement or of human action. The same child who gives an animistic or pre-causal explanation of the fact that it gets dark at night will give an entirely accurate causal account of how their tricycle works. The preschool child who is egocentric in Piaget's experiments can tell you that someone on the other side of a screen from them will not be able to see what they themselves see. Even newborn infants show a rich understanding of some domains.

Similarly, it appears that Piaget overestimated the importance of action in cognitive development, particularly in infancy. Very young infants show signs of reasoning and learning about objects, well before they can act on them. On the other hand, Piaget probably underestimated the importance of social interaction and language in cognitive development. Much of the new research suggests that children are extremely sensitive to social information and are tuned in to the social world from an early age. More generally, Piaget's account of assimilation and accommodation as the basic mechanisms of 'constructivism' now seems too vague.

Some developmentalists have seen these problems as a reason for rejecting not only the detailed theory but the project of 'constructivism' - of a middle way between classical nativism and empiricism - altogether. Many have returned to one version or another of the classical philosophical alternatives. Modularity theories, for example, are a variant of classical rationalism (see Modularity of mind). Connectionist or dynamic systems theories, or some version of social constructivism, are a variant of classical empiricism (see Connectionism; Empiricism). However, most developmentalists would probably prefer to revise Piaget's general view of development rather than to replace it. Perhaps the clearest contemporary theoretical legacy of Piaget is the idea that cognitive development is the result of the same mechanisms that lead to theory change in science (see Scientific method; Kuhn, T.). Testing or confirming the theory by experiment might be a modern version of assimilation, while revising the theory in the light of counter-evidence would be more like accommodation. Piaget's most enduring legacy of all, however, was the idea that the grand questions of 'genetic epistemology', questions that date back to Socrates, could be answered by paying attention to the small details of the daily lives of our children.

Pico della Mirandola, Giovanni (1463-94)

Giovanni Pico della Mirandola, today the best known of Renaissance philosophers, was a child prodigy and gentleman scholar who studied humanities, Aristotelianism and Platonism with the greatest teachers of his day. He claimed to have mastered, by the age of twenty-four, all known theological systems, Christian and non-Christian, from Moses to his own time. He was the first important Christian student of the Jewish mystical theology known as Kabbalah. The purpose of Pico's philosophical and theological studies was to produce a grand synthesis of religious wisdom which would both deepen understanding of Christian truth and also serve as an apologetic weapon against non-Christians. This was the project outlined in Pico's most famous work, De dignitate hominis (On the Dignity of Man) (1486), and further illuminated by his Conclusiones (1486) and Apologia (1487). As part of this larger project, Pico planned to write a concord of Plato and Aristotle, of which only a fragment, the treatise De ente et uno (On Being and the One) (1491), was ever finished. Although he proposed to found a new theological school based on an esoteric reading of all theologies past and present, he did not believe that these theologies were the same in substance, differing only in expression. He insisted on the differences between Platonism and Christianity, while holding that every major theological tradition did contain some elements of truth.

In addition to other, non-philosophical works, Pico wrote the Commento (1486), a commentary on a Neoplatonic poem that in effect constituted a critique of Marsilio Ficino's most famous work, the dialogue De amore (On Love) (1469). He criticized Ficino as too literary and defended the use of precise technical language in philosophy. Pico used Neoplatonic metaphysics to rediscover the 'secret mysteries' of pagan theology (though he sometimes criticized the reliability of the Neoplatonists as guides to Plato's thought) and offered a fresh interpretation of the metaphysics of love based on his own reading of Platonic sources, seeing human erotic love as a psychological process distinct from cosmic love.

1 Life and works

Giovanni Pico della Mirandola was born in the small north Italian principality of Mirandola in 1463. Though he eventually succeeded an older brother as Count of Mirandola and Concordia, he was originally intended by his parents for an ecclesiastical career. With this end in view he was sent in 1477 to the University of Bologna to study canon law. In 1479 he left Bologna without taking his degree and went to Ferrara, where he studied with the famous humanist schoolmaster Battista Guarino. By 1480 he was in Padua hearing lectures on Aristotelian philosophy and studying privately with the Jewish Averroist Elijah Delmedigo (see Averroism, Jewish). He also at this time formed a lasting friendship with the great Venetian scholar and humanist Ermolao Barbaro. Barbaro tried to interest Pico in his own project of freeing Aristotle from the 'corrupt' interpretations of medieval Arabic and Latin commentators with the help of Aristotle's ancient Greek commentators. In 1482 Pico wrote to Marsilio Ficino asking for a copy of his recent *Theologia platonica (Platonic Theology)* (1474). He evidently found the work interesting, for in 1484 he came to Florence to sit at Ficino's feet and master the new Platonic sources that Ficino was making available to the Latin world. In 1485 Pico went to Paris to study medieval scholastic philosophy, returning to Florence a year later, where he began to study Hebrew and Arabic with the Jewish Kabbalist Flavio Mithridates. After a scandalous episode in which he attempted to abduct the wife of an Aretine tax official, Pico settled in Perugia where he continued his Hebrew and Kabbalist studies under the tutelage of several Jewish teachers.

Pico's education thus exposed him to practically every sort of philosophical subculture that high Renaissance Europe could offer: humanism, Paduan Averroism, the theological traditions of the great religious orders (particularly Thomism), and the more esoteric traditions of Florentine Neoplatonism and medieval Jewish Kabbalah. Pico mastered each of these traditions without himself being mastered by any of them. Despite his enviable knowledge of Greek, Arabic and Hebrew, and his ability to write elegant humanist Latin, Pico never endorsed the shallow humanist tendency to dismiss scholastic philosophy because of its neglect of good Latinity and its unconcern with the study of Greek philosophy in the original. In a famous letter to Ermolao Barbaro (1485), Pico praised the great medieval philosophers and defended the right of philosophers to use their own precise technical language. Pico was equally discriminating in his use of Ficinian Platonism. As he wrote in another letter to Barbaro (echoing Cicero), he came to his studies with Ficino 'not as a deserter' from Aristotle

'but as a spy' (*explorator*). His own doctrines, though clearly indebted to Ficino as well as to ancient Neoplatonists, were at the same time distinctive, and Pico did not hesitate to criticize even the most authoritative ancient sources, such as Plotinus and Proclus, when he believed that they had misread Plato (see Platonism, Renaissance).

Pico's career as a philosophical writer began in 1486, when he composed the original draft of his *Commento sopra una canzona de amore composta da Girolamo Benivieni secondo la mente et opinione de' Platonici (Commentary on a poem about love composed by Girolamo Benivieni, according to the understanding and opinion of the Platonists)*, known as the *Commento* for short. This work contained extracts from three other works, never published and now presumably lost: a commentary on Plato's *Symposium*, a poetic theology (a reconstruction of 'ancient theology' based on his reading of the pagan myths) and a treatise on love. In 1486 Pico also conceived the idea of holding a great public disputation (or 'council' as he referred to it) in Rome in which he would reveal a new theological system based on a profound study of all philosophies and theologies past and present. In aid of this project he published the *Conclusiones*, a list of 900 theses drawn from Christian, Jewish, Muslim, Platonic, Aristotelian, Hermetist, Orphic, Zoroastrian, Kabbalist and other sources. He announced that he would defend his theses publicly early in 1487, and summoned to the disputation the Pope, the College of Cardinals, and all philosophers and theologians in Italy, offering to pay the travelling costs of any challengers. He also composed, in December 1486, the so-called *De dignitate hominis (Oration on the Dignity of Man)* which was intended as an introductory speech to open the 'council'. This was to become Pico's most famous work.

On 20 February 1487 Pope Innocent VIII, at the instigation of some theologians at his court, ordered Pico's disputation suspended and appointed a commission of inquiry which in due course condemned thirteen of Pico's theses. Pico responded by publishing his *Apologia* in defence of the condemned theses. In a bull dated 4 August 1487 but not (it seems) published until November, Innocent finally condemned all 900 theses *en bloc* and ordered Pico arrested for heresy. By this time Pico had escaped to France, where he was detained by the French king at the Pope's request. The philosopher was eventually allowed to return to Florence (1488) to live under the protection of Lorenzo de'Medici, who had intervened on his behalf with the Pope. Apart from brief visits to Ferrara, Pico spent the last six years of his life at Lorenzo's 'court', attempting to carry forward his project of making a concord of all theologies. In 1489 he published *Heptaplus de opere sex dierum Geneseos (On the Sevenfold Narration of the Six Days of Genesis)*, an attempt to turn the first chapter of Genesis into a textbook of Greek cosmology through the liberal use of allegory. The short tract *De ente et uno (On Being and the One)* was completed in 1491; it was part of a much longer work demonstrating the concord of Plato and Aristotle which was left unfinished at Pico's death in 1494 and is now lost. After the death of Lorenzo de'Medici, Pico came briefly under the influence of the religious reformer Savonarola (see Scepticism, Renaissance §3), and it is to this part of his life that Pico's biblical commentaries and shorter religious and devotional writings belong. Pico also composed a long tract against astrology, an exposition of Kabbalah and a number of letters and poems. Here we shall be concerned only with the philosophical portion of Pico's literary production.

2 The theory of love

Pico's independence as a thinker and his synthetic abilities are well illustrated by his first major work of philosophy, the *Commento*. This was a philosophical commentary in the manner of Dante's *Convivio* on some verses by Pico's friend, Girolamo Benivieni, a gentleman-poet who like Pico had been a disciple of Ficino. Benivieni had composed a *canzone*, 'Amor dalle cui', in emulation of the famous *canzone* 'Donna me prega' written about 1285 by Guido Cavalcanti (whose descendent, Giovanni Cavalcanti, happened to be Ficino's 'Platonic lover'). Guido Cavalcanti's poem had interpreted the phenomena of human love using the Aristotelian psychology and physics just then coming into vogue in Florence; Benivieni, two centuries later, tried to use Ficino's new Platonic metaphysics to describe divine love. His *canzone* was in fact based on five chapters (II.5, 7; V.4; VI.4, 7) of Ficino's most popular work, *De amore (On Love)* (1469) (see Ficino, M. §4). Pico's *Commento* on the poem had two chief aims. One aim was to rediscover the 'secret mysteries' of pagan theology using Neoplatonic metaphysics as a key: in the manner of Proclus and Pletho, Pico argued for identifying pagan divinities with various metaphysical entities and principles (Venus for example with Beauty itself, Uranus with God, Neptune with Mind, Vulcan with the Demiurge of the *Timaeus*, and so forth). Pico's second aim was to supplement and correct Ficino's account of the metaphysics of love with a fresh interpretation based on Pico's own reading of Platonic sources. The original draft of the *Commento*, indeed, was in essence a sharp and often personal

critique of *De amore*. (In the draft finally published in 1519, the attacks on Ficino were edited out by mutual friends.)

Pico criticized Ficino on numerous points, both methodological and doctrinal. Pico found Ficino's approach too literary, faulting it for its failure to define terms and employ precise scholastic terminology. Doctrinally, Pico insisted against Ficino that the contemplative intellect while in the body does not enjoy union with God himself, but only with the First Mind, the highest unity in the Plotinian hypostasis of *nous* (see Plotinus §3). Moreover, while Ficino had built his conception of Platonic love on the metaphysical identity of *philia* and *eros*, friendship and love, Pico asserts that the *eros* of which Plato spoke in the *Symposium* is a special sort of metaphysical power, distinct from friendship, from God's love for his creatures and from other unitive powers in the cosmos (see Love). In the same way, Pico argues for a sharp distinction, both metaphysical and moral, between physical and intellectual love, against Ficino's view that the two 'Venuses' formed a continuum, a unified system of cosmic dynamics. Against Ficino, again, Pico adopts an anti-Plotinian definition of Beauty, seeing it as a visual or intelligible harmony rather than an emanation from an Idea of Beauty belonging to *nous*. Finally, Pico rejects Ficino's attempt to integrate human love into a cosmic cycle of divine creative love descending from God down to creatures and linked back to God by the desire of creation for its creator. Pico, instead, sees love as a psychological process distinct from cosmic love. Divine love is a desire excited by intelligible beauty, and Pico assimilates the excitation of divine love in the rational soul to the process of cognition. In this way Pico transforms Aristotle's analysis of cognition in *On the Soul* (see Aristotle §17), as well as elements taken from Plotinus and Avicenna (see Ibn Sina), into an esoteric key to the speech of Diotima in the *Symposium*.

Despite the vehemence of Pico's disagreements with Ficino, one may not assume that the *Commento* represents Pico's considered views on any question. As the subtitle indicates, the work is intended as a kind of thought experiment or mental game. 'According to the understanding and opinion of the Platonists' means 'what a Platonist would or ought to say about love', not necessarily what Pico himself believed. This is a broadly Averroist approach to Plato in that Pico distinguishes explicitly between 'Christian truth' and Platonic 'understanding and opinion', and it was designed, like much of Pico's work, to infuriate his teacher Ficino. The aim of Ficino's scholarly and philosophical work was always to show the harmony of Plato with Christianity; his chief opponents were Aristotelian Averroists who in Ficino's view were deepening the divide between religion and philosophy (see Averroism). Pico's *Commento* insists at numerous points on the differences between Platonism and Christianity. He asserts that the Platonists believed in the eternal recurrence of the cosmos; in the pre-existence of the soul; in the possibility of embodied souls having direct knowledge of God; in the existence of intermediate creators between God the Supreme Creator and the cosmos. All of these doctrines since the twelfth century had subjected Platonists to charges of unorthodoxy. But since Pico in the *Commento* was writing under the persona of a Platonist, we are not licensed to assume that he had necessarily, at this stage of his career, embraced unorthodox beliefs, nor that his thought went through a development from an early Platonism to a mature Aristotelianism. Where Pico speaks *in propria persona* his works display great internal consistency.

3 The Roman disputation

Within a month of circulating the first draft of his *Commento*, indeed, Pico had published his own 900 theses and had begun drafting an oration meant to introduce them to the learned world. The oration is in effect an apology for a layman's devoting himself to theology and an answer to critics of Pico's proposed disputation. It belongs to the genre of the academic prolusion, a speech meant to introduce a university course of lectures or a formal disputation. Like most academic prolusions, it is divided into two parts, the first part praising the subject-matter, the second offering an overview of the material to be covered. Pico praises his subject-matter, theology, arguing that human beings fulfil the highest potentialities of their nature by contemplating divine things. Humans have a protean nature which permits them to live like beasts or angels, but they have a moral duty to live the highest kind of life of that they can. In order to achieve an angelic life of contemplation and love of the divine, one must pass through the stages of mystical education as set forth by Pseudo-Dionysius the Areopagite: purification, illumination, perfection. Following Byzantine tradition, Pico assimilates these stages to the four parts of philosophy, arranged hierarchically from the lowest (moral philosophy and dialectic), through natural philosophy, to the highest (metaphysics or theology) (see Byzantine philosophy). Using allegory he then proceeds to find these same stages in a variety of theological traditions, including the Mosaic, Pauline, Platonic, Zoroastrian and Pythagorean. Like Plato, Pico believes that the illumination acquired at the apex of metaphysical consciousness

will bring order and peace to the individual soul and unity among all rational beings who share this highest form of consciousness (see Illumination).

Pico's speech was given the title *On the Dignity of Man* by its sixteenth-century editors, and this has led to much misleading commentary on the part of modern scholars. The posthumous title seems to have been derived from the first few pages of the text, where Pico states (in the form of a myth) that the excellence of the human being does not derive from its central place in the Great Chain of Being (as Ficino had maintained), but precisely from its ability to choose its own place in the order of nature. Themselves standing outside the order of nature, human beings can shape their own essence; they can degrade themselves to live like beasts, or can raise themselves to the angelic order. Modern interpreters have seen this passage as embodying a distinctively Renaissance anthropology or even as the forerunner of more modern conceptions of human nature. It has been implausibly maintained that Pico's conception of the human being - placed in the centre of the world as an observer but outside the hierarchy of fixed essences - anticipates Descartes' theory of mind; or that Pico's description of the plasticity of human nature and the impact of moral choices upon metaphysical dignity can be linked to the existentialist doctrine that existence precedes essence. It should nevertheless be recognized that, despite its modern ring, much of Pico's anthropology is derivative from Boethius and Greek patristic sources, particularly from the Platonisms of Gregory of Nyssa (see Patristic philosophy) and Origen. Pico chose not to advertise his debt, probably because the orthodoxy of both Gregory and Origen was suspect. In any case, Pico's account of the 'chameleon' nature of human beings very likely represents an attempt to understand in a Christian sense the Pythagorean and Platonic doctrines of palingenesis or the transmigration of souls. Pico's statement that humans stand outside the triple hierarchy of being, occupying (as he says in the *Heptaplus*) a 'fourth world', may not amount to more than a dramatic restatement of the familiar twelfth-century doctrine of the human being as a microcosm of the universe.

The second part of the *Oration* explains why Pico wanted to defend so many theses from so broad a range of sources both Christian and non-Christian. Disputations in theology faculties of the period typically involved a few dozen theses, mostly from Christian authorities. In Italy theological disputation was normally confined to licensed members of religious orders. So Pico's performance, though not unprecedented, was highly unusual for a layman who lacked a university degree. Pico argued that the method and aims of his inquiry required him to cover a vast field. Theologians who belonged to developed school traditions could confine themselves to the clarification of details. But he was proposing to found a new theological school altogether, and a school based on an esoteric reading of all theologies past and present. He could not therefore be expected to limit himself to a few points of disputation. The same procedure, he observed, was followed by Aristotle, who always began a new inquiry by reviewing all previous opinions. Pico went on to give a *tour d'horizon* of the 900 theses, trying especially to show why the Latin and Arabic theological traditions ought to be enriched by the study of ancient theologies such as Platonism, Hermeticism, Zoroastrianism, Orphism and Kabbalism (see Ficino, M. §2). Pico took particular pride in his efforts to study Kabbalah from a Christian perspective; in the revival of 'ancient theology' this was one area where he had clearly moved beyond the work of Ficino. Pico assured his audience that, rightly understood, this esoteric theological tradition handed down from the time of Moses would only strengthen Christian efforts to convert the Jews.

Pico's published *Conclusiones* and his *Apologia* cast further light on his goals as a philosopher and theologian. Pico's aim is not to show that all theologies agreed in all respects. He was not an eclectic of the ancient type who believed that all philosophers agreed in substance, disagreeing only about words. He held that every major theological tradition contained elements of truth and that these elements could be combined into a grand synthesis that was at the same time compatible with orthodox Christianity. Like Nicholas of Cusa, he believed that the understanding previous theologians had of the sources of their own theological traditions was not necessarily correct. In fact his aim was to construct a new theology using material from existing historical theologies as building blocks. His new theology would be superior to existing theologies because it would give a richer understanding of Christian truths. This is not to imply that Pico was interested in directly challenging Christian dogmas. But he did wish (like many humanists) to move Christian theological speculation beyond the narrow circle of traditional authorities represented by Aristotle, the Bible and the *Sentences* of Peter Lombard. Situating Christian theology in the spectrum of world theologies would show both the superiority of Christian truth and the presence of Christian truths in all religions. Pico's ecumenism is therefore a militant ecumenism. At the same time, Pico hoped that recovering the esoteric truths of other religious traditions would make the mysteries of Christianity

more intelligible.

Pico's concordism might then be read as a kind of Thomistic project to incorporate non-Christian wisdom into a Christian speculative framework. But there is a critical difference between Thomas Aquinas and Pico which is best grasped by noting what is left out of Pico's theology. Pico has no ecclesiology, no soteriology in the traditional sense, and no doctrine of grace. Instead, Pico emphasizes the radical freedom of human beings in this life to achieve angelic levels of illumination and moral dignity through the exercise of powers belonging to human nature *qua* human. The neglect of grace is typical of the humanist theologies of the period, and reflects the widespread contempt for the Church's practice of reinforcing its wealth and position by marketing spiritual favours. That Pico attempted to propagate his new theology among the highest authorities in Christendom thus becomes a highly significant fact. It suggests that he shared some of the aims, if not the strategies, of the Protestant reformers of the next generation. It implies that the theological movement started by Ficino and Pico was not the esoteric and politically quietist movement it is sometimes represented as being, but had transformative aims as radical as those of Girolamo Savonarola and Martin Luther.

4 The concord of Plato and Aristotle

After Pico's first brash attempt to convert the Roman church to his new theology had failed, he devoted his energies to working out two pieces of his larger concordist project: the concord of Christianity and Kabbalism and the concord of Plato and Aristotle. The former task was taken up first, in *Heptaplus de opere sex dierum Geneseos (On the Sevenfold Narration of the Six Days of Genesis)*. Here Pico, like the Platonists of the twelfth century, attempted to use a non-Christian theology as a key to the creation stories in the first chapter of Genesis (see Chartres, School of). Unlike the hexaemeral treatises of the earlier Platonists, however, Pico maintained that Genesis 1 was an esoteric text. Moses had deliberately implanted in it secret cosmological doctrines that might be abstracted by an interpreter learned in Kabbalist lore. Pico's stated purpose in wresting cosmological mysteries from the Bible was to show that Moses knew what the best philosophers knew. He could in this way show that there was no gap between reason and revelation. But whatever Pico's stated aims, his view of Genesis had radical implications. To employ a modern parallel, it is as though a contemporary exegete of the Bible should maintain that there was not only no conflict between Genesis and evolutionary biology, but that Moses had intentionally concealed evolutionary teachings under the guise of Genesis' account of creation. This radical claim, combined with Pico's circular hermeneutical method, in effect turns the literal sense of Genesis into a myth and subordinates traditional Christian teachings to the teachings of philosophers and non-Christian theologians.

Of Pico's other project of his last years, the concord of Plato and Aristotle, we have only the short tractate *On Being and the One*. The purpose of this work was to criticize one of the cardinal theological doctrines of Ficino and the ancient Neoplatonists, namely the radical transcendence of the One 'beyond being'. On this issue Ficino followed Plotinus and Proclus, who had in turn based themselves on a particular reading of Plato's *Parmenides* (see Plato). The Neoplatonists regarded that dialogue as an esoteric work containing the most sublime mysteries of Platonic theology. Against Ficino, Pico maintained that *esse ipsum* (being itself) and the One were 'convertible' or identical in extension, and that both were distinct from *ens* (participated being). This conception was borrowed from Thomas Aquinas; Pico's originality lay in claiming that it was shared by both Plato and Aristotle. To argue the point, Pico was obliged to challenge two assumptions that had gone largely unexamined for a millennium. The first, characteristic of ancient Neoplatonists but found also among Greek patristic and Byzantine interpreters, as well as Latin theologians such as Augustine, was that Plato was superior to Aristotle in theology (see Aristotelianism, medieval; Platonism, medieval). Pico maintained that Aristotle was Plato's equal as a theologian. In effect he includes Aristotle among the ancient theologians. The second assumption was that the Neoplatonists were reliable guides to the thought of Plato. This too Pico denied. Pico revived the Academic sceptical interpretation of the *Parmenides*, which regarded the dialogue as an eristic work, a dialectical exercise containing no positive doctrines. Unlike the Academic sceptics, however, Pico did not interpret all the dialogues of Plato this way. While in his view the *Parmenides* was a purely eristic work, other dialogues of Plato, particularly the *Sophist* and *Philebus*, could be used to recover Plato's own views on metaphysical questions and to correct the false readings of the *platonici*.

Pico's interpretation of Plato thus represents a step towards the modern distinction between Plato and the Neoplatonists, even if his view of the authentic Plato is very different from that of modern scholarship. His

exegetical project is very much a Renaissance project in its attempt to distinguish the original source from later glosses and to privilege the former over the latter. Pico's concordism also reflects the situation of Renaissance philosophy in another respect. In the central Middle Ages, philosophical study in the universities had been carefully regulated by official curricula, textbooks and university statutes. Theology was even more closely controlled. By the fifteenth century, thanks largely to the humanist movement, philosophers were being introduced to an ever-widening range of philosophical and theological opinion, often in far less regulated circumstances. The bewildering variety of intellectual choices and the greater freedom of study (if not of expression) posed a major challenge to philosophers of the later fifteenth and sixteenth centuries. Some philosophers responded by embracing scepticism; others by advocating fideism (see Scepticism, Renaissance); still others - ultimately the most influential group - by exploring new methodologies for adjudicating between incommensurable systems of thought. Pico's concordism represents a fourth alternative. If many of Pico's hermeneutical techniques, especially allegory, now seem little more than primitive forms of secondary elaboration, the dream of a great theological system that would reconcile in itself trans-historical and trans-cultural truths taken from all forms of religious wisdom was one that would have a considerable fortune down to the present day.

Pietism

'Pietism' refers to a Protestant reform movement, arising in the late 1600s in Lutheran Germany, which turned away from contests over theological and dogmatic identity in Protestant confessionalism and urged renewed attention to questions of personal piety and devotion. As such, it has only the most tenuous historical connections to the Christocentric piety of the devotio moderna *or the northern humanist piety of Erasmus or Zwingli. It found its first major voice in P.J. Spener and A.H. Francke, and established its principal centres of influence at the state university at Halle in 1691 and the Moravian community at Herrnhut in 1722. Pietism found followers and allies in the European Reformed churches, in the Church of England (especially through the example of John and Charles Wesley and through the Moravian exile community in England), and in Britain's English-speaking colonies. In the colonies, pietism not only found Lutheran and Reformed colonial hosts, but also saw in New England Puritanism a movement of similar aspirations. Pietism's impact on the spirituality of western Europe and America was clearly felt in the eighteenth-century Protestant Awakenings, and continues to have an influence in the shape of Anglo-American evangelicalism.*

1 Definition

Pietism may be defined very broadly as a reawakening in western Europe (and Europe's American colonies) of the most intense and aggressive forms of devotional Christianity from about 1650 to 1750. In this broad sense, it can include Jansenism in Roman Catholic France, the Non-Jurors, the eighteenth-century Moravians, and the English and American Methodists who followed John and Charles Wesley. But in its most specific use, the term 'pietism' was first used in 1674 to refer to the followers of the German Lutheran spiritual reformer Philip Jakob Spener, and it is from this particular movement within Lutheranism that 'pietism' is generally understood to derive its historical identity.

Pietism can be characterized as a Christian and Protestant movement which located the essence of Christianity more in the quality of an individual's personal feeling of relationship to God than in a rational assent to the various forms of Christian theology or in submission to any Christian rites of identity, such as baptism or the Eucharist. It stands apart from its medieval, mystical and humanist predecessors in its biblicism, its persistently Protestant forms, and the extraordinary energies it devoted to promoting popular awakenings and evangelism. Similarly, pietism's preoccupation with 'personalizing' Christian belief was never a matter of total withdrawal from conventional Christian forms, but rather a matter of emphasis in the priority and use of those forms, since not even the most radical pietist groups completely repudiated the Christian sacraments or questioned the validity of organized churches. But the pietists did subordinate these considerations to those of personal devotion to God. This allowed them to take a remarkably tolerant and irenic stance towards questions of confessional debate within Protestantism, since such questions had little significance for the pietists except in so far as they promoted the individual's personal devotion to God.

But irenicism across confessional boundaries stopped short when pietists addressed the boundary between those who had experienced a renewed dedication of their spiritual lives to God and those who either had not or did not care to do so. Pietists drew a deep antithetical line between those who had experienced a 'new birth' or 'second birth' (*Wiedergeburt*) and those with a purely 'notional' Christianity, who had never experienced contrition and repentance. On the one hand, this drove them to proselytization and missionary programmes among nominal Christian and non-Christian populations in Europe, America and Asia, but on the other, it drove them to place so much distance between 'notional' Christianity and their own personal practice that many pietists came close to a demand for moral perfection. In the case of John Wesley, perfection was actually promoted as an attainable goal (see Sanctification §3).

2 History

The foundations for pietism lie in the first wave of Protestantism, which cultivated a strong sense of personal Christian spirituality alongside its concern with revising Catholic dogma. Much of that devotionalism was submerged, however, during the waves of religious warfare that swept over Europe as a result of the Reformation, and lasted, with intermissions, until 1648. The need clearly to identify who Protestantism's friends and enemies were fostered a century of theological system-building and confession-writing (*Verconfessionalisierung*) in

Germany. But by the end of the Thirty Years' War, with the German lands devastated by the marauding criss-cross of Protestant and Catholic armies, no absolute victor had emerged to legitimize any of the Protestant confessions, and many Lutherans felt betrayed by the failure of their state churches and princes to deliver either Protestant triumph or reform of public life. After 1680, these anxieties were heightened by a renewed Catholic determination to undo the Westphalian compromises of 1648 within Catholic-ruled domains.

Spener was pastor and senior of the ministerium in Frankfurt. He became convinced that the state Lutheran churches had failed the German people and had descended into theological irrelevance and doctrinal trivia. Disgusted, he published *Pia Desideria: or, Heartfelt Desires for a God-Pleasing Improvement of the True Protestant Church* (1675) as his blast against the prevailing lifelessness of the Lutheran churches, and in it he set out six proposals for reviving the German churches:

(1) rededicate the energies of the churches to the study of the Bible as the object of devotional meditation and spirituality;
(2) break down the wall of separation between clergy and laity;
(3) emphasize practical, rather than theological or intellectual, Christianity, in terms of service and worship;
(4) abandon religious argument and controversy with other churches or sects;
(5) reorganize the training of future ministers in the German universities so as to stress the formation of spiritual lives rather than doctrine;
(6) revitalize preaching with view to promoting the people's edification.

In 1686, Spener was appointed official preacher to the court of the Duke of Saxony. There, he met and influenced a young lecturer at the Saxon university at Leipzig, August Hermann Francke. As a theological student, Francke acknowledged that he had grasped confessional Lutheranism 'only in my reason and in my thought' and it was not until he had experienced repentance (*Bußkampf*) that 'all sadness and unrest of my heart was taken away at once, and I was immediately overwhelmed as with a stream of joy so that with full joy I praised and gave honor to God who had shown me such great grace.' Francke 'arose a completely different person' and became Spener's friend and disciple, and when in 1691 the Elector Frederick William III of Prussia promoted the *Ritterakademie* at Halle to the rank of university, Francke was appointed a professor and quickly turned Halle into an engine of pietist recruitment and evangelism. Still another centre of pietist energy sprang up in 1722 under the leadership of Nikolaus Ludwig Graf von Zinzendorf. Zinzendorf was the eldest son of a noble Saxon family, but his parents (and especially the grandmother who was mostly responsible for his upbringing) had been greatly influenced by Spener. His estates at Berthelsdorf lay directly across the track of Moravian Protestant refugees, fleeing forced conversion by the Jesuits under imperial Habsburg rule. Zinzendorf, hearing of the plight of these refugees, turned Berthelsdorf into a refuge for the Moravians and helped organize a community there named 'Herrnhut' ('the Lord watches over'), with a view to turning the entire effort into an experiment in organized pietism.

Spener's criticism of the state Lutheran churches in Germany made the pietists an object of suspicion for Lutheran confessionalists. The use of field meetings, and the encouragement of 'children's testimony' (testimony to religious experience by children in public adult meetings) among Silesian pietists disturbed Lutheran leaders, and the pietists' absorption in personal piety led to charges of indifference to, and even outright departure from, the Lutheran confessional standards. In 1734, Zinzendorf himself was charged with straying from the letter of Lutheran theology; in 1736, he was banished from Saxony. The resurgence of Catholic attempts to impose religious uniformity in France and the Austrian domains also provided an opportunity for Catholic authorities to abrogate tacit agreements with Lutheran minorities in their lands, and in November 1731, the pietist Lutherans of Salzburg were expelled by the archbishop and began a march across Europe that ended only when Prussia opened its doors to approximately 20,000 of the exiles.

Zinzendorf, borrowing money from sympathetic Dutch bankers, moved across Protestant Europe to promote local pietist movements in Württemburg (where he alternately dominated and antagonized F.C. Oetinger and J.A. Bengel) and Switzerland (where the major pietist converts among the state Reformed clergy were Samuel Schumacher and Samuel Lutz in Berne). He was also able to carry the Moravian example abroad, founding new *Herrnhuts* at Marienborn and Herrnhaag in 1736 and 1738, gaining official recognition for the Moravians in England, sponsoring Moravian missions to the West Indies, and planting a Moravian colony in British North America. It was in Georgia that a party of Moravian immigrants confronted the young John Wesley, then an

emissary of the Church of England, and when Wesley returned to London in 1738, it was in a Moravian society-meeting in London's Aldersgate Street that he experienced the vivid personal conversion that led to the founding of Methodism.

Pietism also found already existing allies among the English-speaking Puritans in the British colonies of New England. Spener had drawn significant encouragement from the writings of the English Puritans Lewis Bayly, John Bunyan and Richard Baxter, and the expatriate William Ames wielded great influence on the Dutch pietists Willem Brackel and Abraham Hellenbroeck. Although by the early 1700s much of Puritanism's fervour had settled back on its lees in Britain and New England, the American Puritan minister Cotton Mather insisted in 1717 that 'the *American Puritanism*' was 'so much of a Peece with the Frederician Pietism, that if it were possible…to be transferr'd unto our Friends in the lower *Saxony*, it would find some Acceptance' (Lovelace 1979: 33). The Puritan philosopher-theologian Jonathan Edwards (§1), whose reading list included most of the prominent German pietist titles, was moved by the example of the New Jersey Dutch pietist T.J. Freylinghuysen, the Methodist George Whitefield, and the Scots-Irish pietist Gilbert Tennent to promote (and then write a series of sympathetic rationalizations for) the colonial religious revivals known as the 'Great Awakening' (1739-44). By the time of the deaths of Edwards in 1758 and Zinzendorf in 1760, pietism had taken up residence in all of the confessional Protestant churches of Europe, and had established missions or colonies in Greenland, Scandinavia, Egypt, Ceylon and the Caribbean.

3 Continuing influence

Many accounts of pietist history suggest a communal harmony that many of the pietists actually lacked: Zinzendorf could be tyrannical and bullying, and the resentment of Francke's successor at Halle, Gotthilf August, at Zinzendorf's high-handedness led to a cooling of relations between Halle and Herrnhut. Wesley, similarly, was dictatorial and self-centred, breaking ties over personal and theological issues with his talented associate Whitefield and with his Welsh disciples Howell Harris and Daniel Rowland. As a result, pietism never achieved any measure of hegemony within any major Protestant confessional grouping in the 1700s. Only among separatist movements such as the United Brethren and the Methodists did pietism become the dominant form of theological identity, and even then, by the time the Methodists separated from the Church of England after Wesley's death, the movement had become an expression of an idiosyncratic Wesleyanism rather than the larger spirit of pietism.

Part of that failure was due to the ferocious resistance offered to pietism by confessional theologians. Lutheran confessionalists were concerned that the pietist preoccupation with personal experience would obscure the forensic status of justification, which according to Lutheran dogma was established not by the individual's repentance, but by the death of Jesus Christ (see Justification, religious §4). Calvinist theologians, even those in New England otherwise inclined to sympathize with them, were troubled by the pietists' willingness to redefine the atonement of Christ in general terms in order to heighten the possibility of repentance and redemption for all, which appeared in Calvinist eyes to diminish the actual worth of the atonement as a real means of redemption (see Atonement §4). Wesley in particular repudiated the moderate Calvinism of the Church of England's Thirty-Nine Articles of Religion for an evangelicalized Arminianism which converted the free-will rationalism of Jacobus Arminius into an engine for freely chosen and freely demanded conversion. And, as in the example of both Halle and the Methodists, the high demands of pietism for Christian conduct could easily yield to legalistic requirements for conformity to mere behavioural codes.

However, many other criticisms of the pietists as ascetic, anti-cultural or anti-intellectual have less justification. Except for the Moravians, pietist movements were open associations with little inclination towards communal withdrawal from the world. Francke, the most talented organizer among the pietist leaders, created one of the largest public charities in Europe with the Halle Orphanage in 1695, and his example was imitated (though on a lesser scale) by both Wesley and Whitefield. The musical culture of the Moravians, even in their colonial settlements, was of a very high order, and pietist hymnody, especially from Charles Wesley and Gerhard Tersteegen, has been absorbed into the Church music of many of their confessional critics. If the pietists were, at first appearance, hostile to any learning that lacked personal piety, they also shared a basic similarity with the Enlightenment in their refusal to accept the testimony of past authority for truth and the demand that truth be grounded in demonstration and experience. The pietist revolt against formalism would be re-echoed in the Christian Romantics, especially in Friedrich Schleiermacher (§§1, 7) (who has been rightly called the executor of

pietism's last will and testament) and Søren Kierkegaard (§4). The pietist influence mediated in America by the 'Great Awakening' had a long-term influence in American pragmatic philosophy and has been the dominant force in the shaping of modern American and British evangelicalism.

Planck, Max Karl Ernst Ludwig (1858-1947)

Planck was a German theoretical physicist and leader of the German physics community in the first half of the twentieth century. Famous for his introduction of the quantum hypothesis in physics, Planck was also a prolific writer on popular-scientific and philosophical topics. Even more so than his younger contemporary Albert Einstein, Planck was well-known in his day for his defence of a realist conception of science and his explicit criticism of the positivism of Ernst Mach and the Vienna Circle.

Max Planck was born in Kiel and after 1867 moved with his family to Munich. Planck studied physics with Philipp von Jolly at Munich and with Herman von Helmholtz and Gustav Kirchhoff at Berlin, taking his doctorate in Munich in 1879. After working as a *Privatdozent* in Munich, Planck was named *Außerordentlicher Professor* in Kiel in 1885. Most of his career was lived in Berlin, where he was called as Kirchhoff's successor in 1889, being named *Ordentlicher Professor* in 1892. During his Berlin years, Planck became perhaps the most influential figure in the German physics community, serving, among other roles, as secretary of the Prussian Academy of Sciences from 1912 until 1938 and as President of the Kaiser-Wilhelm-Gesellschaft from 1930 to 1935 and again briefly after the Second World War, before it was renamed the Max-Planck-Gesellschaft in his honour in 1946. Among Planck's students in Berlin was Moritz Schlick, who completed a dissertation under Planck in 1904. From 1914 until 1933, Albert Einstein was one of his closest colleagues; Erwin Schrödinger was his successor. After retirement in 1928, Planck continued to be quite active, writing especially on broader popular and philosophical topics, and struggling after 1933 to preserve some of the dignity and integrity of German physics under Hitler. Planck was a political conservative and a defender of the highest ideals of German culture. For all of Planck's prominence, his life was dogged by tragedy, including the death of his first wife Marie, in 1909, the deaths of his twin daughters Grete and Emma, in childbirth in 1917 and 1919, the death of his elder son Karl, from war wounds in 1918, the destruction by bombing in 1944 of his home in Berlin-Grünewald, along with all of the personal papers and possessions it contained, and the execution of his younger son Erwin, in 1945, for complicity in the plot to assassinate Hitler.

Planck's early work concerned primarily thermodynamics and efforts to clarify the concept of entropy - this in the tradition of Rudolf Clausius and the mechanical theory of heat. One early controversy involved his defence of the mechanical worldview against energeticist critics of atomism and mechanism, including Wilhelm Ostwald and Georg Helm; another involved his defence of the second law of thermodynamics as a deterministic law against Ludwig Boltzmann's statistical interpretation of the entropy law (see Thermodynamics). Planck's most famous contribution to physics, for which he earned the Nobel Prize in 1918, was his introduction of the quantum hypothesis. The idea of the quantum first appeared in the formula for the frequency distribution of the energy of black-body radiation as a function of temperature that Planck derived late in 1900. The Planck formula contained two constants. One is the constant, h, later recognized as representing the quantum of action and named the Planck constant. Planck originally thought that it was only the exchange of energy between matter and radiation that was quantized. Einstein first proposed in 1905 that free radiant energy itself exists in a quantized form as photons. Planck's analysis of how the second constant, k, the Boltzmann constant, entered the derivation of the distribution formula yielded a theoretical determination of the value of Avogadro's number and hence confirmation of the atomistic hypothesis. Planck was an early and enthusiastic supporter of the theory of relativity (see Relativity theory, philosophical significance of), but to the end of his life remained sceptical of the Copenhagen interpretation of quantum mechanics associated with Niels Bohr and Werner Heisenberg (see Quantum mechanics, interpretation of).

Planck's commitment to atomism led him into a well-known debate with Ernst Mach over realism and positivism (Planck 1909, 1910; Mach 1910) (see Scientific realism and antirealism; Logical positivism). In his lecture, 'Die Einheit des physikalischen Weltbildes' (1909), Planck argued against Mach that ' however little we know about their more specific properties, the atoms are no more and no less real than the heavenly bodies', adding that what sustained the 'great masters' of natural science - Copernicus, Kepler, Newton, Huygens and Faraday - in their struggles against 'received opinion' and 'higher authorities' was not the 'economical point of view' but their 'rock-solid…belief in the reality of their world picture'. With the rise of the Vienna Circle and logical empiricism in the later 1920s (see Vienna Circle), Planck returned to this theme. It was sufficiently important for him to make

it the focus of his first major address to the Kaiser-Wilhelm-Gesellschaft after being named its President. *Positivismus und reale Außenwelt* (1930) represents Planck's most thoroughgoing critique of positivism. According to Planck, when positivism is carried to its logical conclusion, it ' denies the concept and the necessity of an objective physics, that is to say, one independent of the individuality of the researcher'. An objective physics is achieved only through a 'step into the metaphysical', with the hypothesis 'that our experiences do not themselves constitute the physical world, that they instead only give us information about another world that stands behind them and is independent of us, in other words, that a real external world exists'.

Platform Sutra

The Platform Sutra is the single most important work of early Chinese Chan Buddhism, perhaps of the entire Chan/Sôn/Zen tradition. It purports to contain the teachings of the Sixth Patriarch Huineng (638-713), whom it celebrates as an illiterate but enlightened sage. The centrepiece is an exchange of verses attributed to Shenxiu (606?-706) and Huineng, generally taken to represent, respectively, a gradual or progressive self-cultivation leading to perfect enlightenment and a sudden or subitist style of practice in which enlightenment is attained all at once. The Platform Sutra was actually composed around 780, more than a century after the events it describes. Its reportage is demonstrably inaccurate and its traditional interpretation problematic, but this does not alter the profound mythopoeic importance of the text.

The events described in the *Platform Sutra* supposedly took place at the Chan community led by Hongren (601-74), described here as the Fifth Patriarch. Needing a successor, he instructed his students each to compose and submit a verse describing their understanding of Buddhism. The only one to do so was Shenxiu, depicted here as the earnest and well-educated but as yet unenlightened senior student of the community, who after much consternation wrote the following:

The body is the *bodhi* tree.

The mind is like a bright mirror's stand.

At all times we must strive to polish it

and must not let dust collect.

Hongren praised this verse in public and instructed his students to recite and practice according to it, but in private he told Shenxiu that it was insufficient. Shortly thereafter, Huineng, who was working in the rice threshing room, heard Shenxiu's verse being recited by an acolyte. He immediately understood that its author was still unenlightened and offered his own response:

Bodhi originally has no tree.

The bright mirror also has no stand.

Fundamentally there is not a single thing.

Where could dust arise?

Hongren rejected this verse in public, but in private he bestowed both a final teaching and the status of Sixth Patriarch on Huineng, gave the still unordained layman his robe and bowl as proof of the transmission, and told him to leave the monastery. Huineng spent the next sixteen years living with hunters in the mountains before he presented himself at a Buddhist temple, was recognized as the Sixth Patriarch, and received ordination as a Buddhist monk.

It is the dust-polishing of the first verse that has been interpreted since at least the time of Zongmi (780-841) onward as an expression of gradualism, while the negations contained in the second verse are taken as evidence of subitism. The third line of the second verse, in fact, has been described by the modern Zen popularizer D.T. Suzuki as 'a bomb thrown into the camp of Shen-hsiu [Shenxiu] and his predecessors' (Suzuki 1949: 22). However, these interpretations, the religious identity of the Northern and Southern schools and the nature of the relationship between them are habitually misunderstood in popular writings on Chan.

First, note that there is no explicit reference to gradual improvement in 'Shenxiu's' verse; in fact, Shenxiu and his followers taught a doctrine of the constant and perfect practice of the *bodhisattva*. In the Chinese Buddhist context of the eighth century and beyond, gradualism was considered too elementary, limited by the dualistic conceptualization of enlightenment as a goal that should be reached through progressive effort. In fact, the historical Shenxiu's teachings are expressed in dualistic terms, but they are not gradualistic. Second, where is the subitism of 'Huineng's' verse? This verse cannot stand by itself, but is dependent on the first. If the original author of these verses understood Shenxiu's teachings, then the intent would have been to suggest that Huineng's were

similar in content but more advanced in that they went beyond conceptual or dualistic positions. This explanation of the meaning of the two verses is supported by the following details: (1) Shenxiu and Huineng were never at Hongren's side at the same time, so that the story is fictional; (2) the famous third line above is not contained in the earliest version of the text (from Dunhuang), which actually attributes two slightly different verses to Huineng; and (3) the terms used in both verses - including the third line cited here - were derived from Northern school sources (McRae 1986: 1-6, 235-38). The doctrines of the *Platform Sutra* are similar to those of the Oxhead school of early Chan, which made extensive use of a thesis-antithesis-synthesis form of doctrinal exposition.

Nevertheless, the populist image of Huineng as illiterate sage was profoundly important to the development of Chinese Chan, in that it provided a framework by which to emphasize the primacy of the actual experience of enlightenment over all other factors. By recognizing Huineng as Sixth Patriarch, the Chan tradition showed that - in theory, at least - it would not hesitate to recognize someone so déclassé as an illiterate woodcutter from the far south. Thus, in a fashion akin to the legendary acceptance of Shun as sage emperor, every subsequent selection of a successor by any teacher within Chan - no matter how well-placed the candidate might be in social, political, or economic terms - could similarly be ascribed to purely religious factors. The paradoxical impact of the Huineng story was thus strong ideological support for the developing lineage schema of Chan, in which masters were identified within specific networks of patriarchal relationship.

In addition, from the advent of the *Platform Sutra* the Chan school maintained a consistent preference for sudden over gradual, as well as an equal reluctance to use dualistic doctrinal formulations in teaching. This combination resulted in the development of a new type of religious practice: encounter dialogue, the sometimes spontaneous repartee between master and student that formed the new locus of spiritual cultivation. Huineng had exemplified an intuitive style of teaching that responded to the needs of individual students, and this image was transformed with time into the more dynamic persona of monks such as Linji (d. 866 or 867), who forced his students through their spiritual paces with shouts and fists. The texts of later periods of Chan are stylistically quite different from the *Platform Sutra*, which thus marked the end of early Chan even as it helped lay the groundwork for later developments.

Plato (427-347 BC)

Plato was an Athenian Greek of aristocratic family, active as a philosopher in the first half of the fourth century BC. He was a devoted follower of Socrates, as his writings make abundantly plain. Nearly all are philosophical dialogues - often works of dazzling literary sophistication - in which Socrates takes centre stage. Socrates is usually a charismatic figure who outshines a whole succession of lesser interlocutors, from sophists, politicians and generals to docile teenagers. The most powerfully realistic fictions among the dialogues, such as Protagoras and Symposium, recreate a lost world of exuberant intellectual self-confidence in an Athens not yet torn apart by civil strife or reduced by defeat in the Peloponnesian War.

Some of Plato's earliest writings were evidently composed in an attempt to defend Socrates and his philosophical mission against the misunderstanding and prejudice which - in the view of his friends - had brought about his prosecution and death. Most notable of these are Apology, which purports to reproduce the speeches Socrates gave at his trial, and Gorgias, a long and impassioned debate over the choice between a philosophical and a political life. Several early dialogues pit Socrates against practitioners of rival disciplines, whether rhetoric (as in Gorgias) or sophistic education (Protagoras) or expertise in religion (Euthyphro), and were clearly designed as invitations to philosophy as well as warnings against the pretensions of the alternatives. Apologetic and protreptic concerns are seldom entirely absent from any Platonic dialogue in which Socrates is protagonist, but in others among the early works the emphasis falls more heavily upon his ethical philosophy in its own right. For example, Laches (on courage) and Charmides (on moderation) explore these topics in characteristic Socratic style, relying mostly on his method of elenchus (refutation), although Plato seems by no means committed to a Socratic intellectualist analysis of the virtues as forms of knowledge. That analysis is in fact examined in these dialogues (as also, for example, in Hippias Minor).

In dialogues of Plato's middle period like Meno, Symposium and Phaedo a rather different Socrates is presented. He gives voice to positive positions on a much wider range of topics: not just ethics, but metaphysics and epistemology and psychology too. And he is portrayed as recommending a new and constructive instrument of inquiry borrowed from mathematics, the method of hypothesis. While there are continuities between Plato's early and middle period versions of Socrates, it is clear that an evolution has occurred. Plato is no longer a Socratic, not even a critical and original Socratic: he has turned Socrates into a Platonist.

The two major theories that make up Platonism are the theory of Forms and the doctrine of the immortality of the soul. The notion of a Form is articulated with the aid of conceptual resources drawn from Eleatic philosophy. The ultimate object of a philosopher's search for knowledge is a kind of being that is quite unlike the familiar objects of the phenomenal world: something eternal and changeless, eminently and exclusively whatever - beautiful or just or equal - it is, not qualified in time or place or relation or respect. An account of the Form of Beautiful will explain what it is for something to be beautiful, and indeed other things are caused to be beautiful by their participation in the Beautiful. The middle period dialogues never put forward any proof of the existence of Forms. The theory is usually presented as a basic assumption to which the interlocutors agree to subscribe. Plato seems to treat it as a very general high-level hypothesis which provides the framework within which other questions can be explored, including the immortality of the soul. According to Phaedo, such a hypothesis will only stand if its consequences are consistent with other relevant truths; according to Republic its validity must ultimately be assured by its coherence with the unhypothetical first principle constituted by specification of the Good.

The Pythagorean doctrine of the immortality of the soul, by contrast, is something for which Plato presents explicit proofs whenever he introduces it into discussion. It presupposes the dualist idea that soul and body are intrinsically distinct substances, which coexist during our life, but separate again at death. Its first appearance is in Meno, where it is invoked in explanation of how we acquire a priori knowledge of mathematical truths. Socrates is represented as insisting that nobody imparts such truths to us as information: we work them out for ourselves, by recollecting them from within, where they must have lain untapped as latent memory throughout our lives. But innate forgotten knowledge presupposes a time before the soul entered the body, when it was in full conscious possession of truth. Phaedo holds out the promise that the souls of philosophers who devote their lives to the pursuit of wisdom will upon death be wholly freed from the constraints and contaminations of the body, and achieve pure knowledge of the Forms once again.

Republic, Plato's greatest work, also belongs to this major constructive period of his philosophizing. It gives the epistemology and metaphysics of Forms a key role in political philosophy. The ideally just city (or some approximation to it), and the communist institutions which control the life of its elite governing class, could only become a practical possibility if philosophers were to acquire political power or rulers to engage sincerely and adequately in philosophy. This is because a philosopher-ruler whose emotions have been properly trained and disciplined by Plato's reforming educational programme, and whose mind has been prepared for abstract thought about Forms by rigorous and comprehensive study of mathematics, is the only person with the knowledge and virtue necessary for producing harmony in society. Understanding of Forms, and above all of the Good, keystone of the system of Forms, is thus the essential prerequisite of political order.

It remains disputed how far Plato's vision of a good society ruled by philosopher-statesmen (of both sexes) was ever really conceived as a blueprint for practical implementation. Much of his writing suggests a deep pessimism about the prospects for human happiness. The most potent image in Republic is the analogy of the cave, which depicts ordinary humanity as so shackled by illusions several times removed from the illumination of truth that only radical moral and intellectual conversion could redeem us. And its theory of the human psyche is no less dark: the opposing desires of reason, emotion and appetite render it all too liable to the internal conflict which constitutes moral disease.

While Republic is for modern readers the central text in Plato's œuvre*, throughout much of antiquity and the medieval period Timaeus was the dialogue by which he was best known. In this late work Plato offers an account of the creation of an ordered universe by a divine craftsman, who invests pre-existing matter with every form of life and intelligence by the application of harmonious mathematical ratios. This is claimed to be only a 'likely story', the best explanation we can infer for phenomena which have none of the unchangeable permanence of the Forms. None the less Timaeus is the only work among post-Republic dialogues, apart from a highly-charged myth in Phaedrus, in which Plato was again to communicate the comprehensive vision expressed in the Platonism of the middle period dialogues.*

Many of these dialogues are however remarkable contributions to philosophy, and none more so than the self-critical Parmenides. Here the mature Parmenides is represented as mounting a powerful set of challenges to the logical coherence of the theory of Forms. He urges not abandonment of the theory, but much harder work in the practice of dialectical argument if the challenges are to be met. Other pioneering explorations were in epistemology (Theaetetus) and philosophical logic (Sophist). Theaetetus mounts a powerful attack on Protagoras' relativist theory of truth, before grappling with puzzles about false belief and problems with the perennially attractive idea that knowledge is a complex built out of unknowable simples. Sophist engages with the Parmenidean paradox that what is not cannot be spoken or thought about. It forges fundamental distinctions between identity and predication and between subject and predicate in its attempt to rescue meaningful discourse from the absurdities of the paradox.

In his sixties Plato made two visits to the court of Dionysius II in Sicily, apparently with some hopes of exercising a beneficial influence on the young despot. Both attempts were abysmal failures. But they did not deter Plato from writing extensively on politics in his last years. Statesman explores the practical knowledge the expert statesman must command. It was followed by the longest, even if not the liveliest, work he ever wrote, the twelve books of Laws, perhaps still unfinished at his death.

1 Life

Evidence about Plato's life is *prima facie* plentiful. As well as several ancient biographies, notably that contained in book III of Diogenes Laertius' *Lives of the Philosophers*, we possess a collection of thirteen letters which purport to have been written by Plato. Unfortunately the biographies present what has been aptly characterized as 'a medley of anecdotes, reverential, malicious, or frivolous, but always piquant'. As for the letters, no scholar thinks them all authentic, and some judge that none are.

From the biographies it is safe enough to accept some salient points. Plato was born of an aristocratic Athenian family. He was brother to Glaucon and Adimantus, Socrates' main interlocutors in the *Republic*; his relatives included Critias and Charmides, members of the bloody junta which seized power in Athens at the end of the Peloponnesian War. He became one of the followers of Socrates, after whose execution he withdrew with others

among them to the neighbouring city of Megara. His travels included a visit to the court of Dionysius in Sicily. On returning from Sicily to Athens he began teaching in a gymnasium outside the city, called the Academy.

The *Seventh Letter*, longest and most interesting of the collection of letters, gives a good deal of probably trustworthy information, whether or not it was written by Plato himself. It begins with an account of his growing disenchantment with Athenian politics in early manhood and of his decision against a political career. This is prefatory to a sketch of the visit to Dionysius in Syracuse, which is followed by an elaborate self-justifying explanation of why and how, despite his decision, Plato later became entangled in political intrigue in Sicily, once the young Dionysius II had succeeded to his father's throne. There were two separate visits to the younger Dionysius: one (*c*.366 BC) is represented as undertaken at the behest of Dion, nephew of Dionysius I, in the hope of converting him into a philosopher-ruler; the other (*c*.360 BC) was according to the author an attempt to mediate between Dionysius and Dion, now in exile and out of favour. Both ventures were humiliating failures.

Of more interest for the history of philosophy is Plato's activity in the Academy. We should not conceive, as scholars once did, that he established a formal philosophical school, with its own property and institutional structures. Although he acquired a house and garden in the vicinity, where communal meals were probably taken, much of his philosophical teaching and conversation may well have been conducted in the public space of the gymnasium itself. Some sense of the Academy's distinctive style may be gleaned from evidence of the contemporaneous writings of the philosophical associates he attracted, notably his nephew Speusippus, Xenocrates, Aristotle and the mathematician Eudoxus. Discussion of Plato's metaphysical ideas figured prominently in these; but orthodoxy was not expected, to judge from their philosophical disagreements with him and with each other. Aristotle's early *Topics* suggests that an important role was played by formal disputation about philosophical theses.

From the educational programme of the *Republic* one might have guessed that Plato would have attached importance to the teaching of mathematics as a preparation for philosophy, but we have better evidence for his encouraging research in it. While he was not an original mathematician himself, good sources tell us that he formulated problems for others to solve: for example, what uniform motions will account for the apparent behaviour of the planets. Otherwise there is little reliable information on what was taught in the Academy: not much can be inferred from the burlesque of comic playwrights. Since almost certainly no fees were charged, most of those who came to listen to Plato (from all over the Greek world) must have been aristocrats. Some are known to have entered politics or to have advised princes, particularly on constitutional reform. But the Academy had no political mission of its own. Indeed the rhetorician Isocrates, head of a rival school and admittedly not an unbiased witness, dismissed the abstract disciplines favoured by the Academy for their uselessness in the real world.

2 Writings

Thrasyllus, astrologer to the emperor Tiberius, is the unlikely source of the arrangement of Platonic writings adopted in the manuscript tradition which preserves them. For his edition of Plato he grouped them into tetralogies, reminiscent of the trilogies produced in Athenian tragic theatre. These were organized according to an architectonic scheme constructed on principles that are now only partially apparent, but certainly had nothing to do with chronology of composition. His arrangement began with a quartet 'designed to show what the life of the philosopher is like' (Diogenes Laertius, III 57): *Euthyphro*, or 'On Piety', classified as a 'peirastic' or elenctic dialogue (see Socrates §§3-4), which is a species of one of his two main genres, the dialogue of inquiry; *Apology*, *Crito* and *Phaedo* are all regarded as specimens of exposition, his other main genre, or more specifically as specimens of ethics. These four works are all concerned in one way or another with the trial and death of Socrates.

There followed a group consisting of *Cratylus*, or 'On the Correctness of Names', *Theaetetus*, or 'On Knowledge', *Sophist* and *Politicus* (often Anglicized as *Statesman*). Plato himself indicates that the last three of this set are to be read together. They contain some of his most mature and challenging work in epistemology, metaphysics and philosophical methodology. In this they resemble *Parmenides*, with its famous critique of the theory of Forms, the first of the next tetralogy, which was completed by three major dialogues all reckoned 'ethical' by Thrasyllus: *Philebus*, an examination of pleasure, *Symposium* and *Phaedrus*, both brilliant literary divertissements which explore the nature of love.

A much slighter quartet came next: two dialogues entitled *Alcibiades*, plus *Hipparchus* and *Rivals*. None of these,

with the disputed exception of the first *Alcibiades*, is thought by modern scholarship to be authentic Plato. They were followed by *Theages*, a short piece now generally reckoned spurious, *Charmides*, *Laches*, *Lysis*. These three works are generally regarded by modern scholars as Socratic dialogues: that is, designed to exhibit the distinctive method and ethical preoccupations of the historical Socrates, at least as Plato understood him, not to develop Plato's own philosophy. Thrasyllus would agree with the latter point, since he made them dialogues of inquiry: *Laches* and *Lysis* 'maieutic', in which the character 'Socrates' attempts as intellectual midwife to assist his interlocutors to articulate and work out their own ideas on courage and friendship respectively; *Charmides* elenctic, with the interlocutors Charmides and Critias and their attempts to say what moderation is put to the test of cross-examination, something Thrasyllus interestingly distinguished from philosophical midwifery.

The next group consisted of *Euthydemus*, *Protagoras*, *Gorgias*, *Meno*, important works in which modern scholarship finds analysis and further elaboration by Plato of the Socratic conception of virtue. The first three present a Socrates in argumentative conflict with sophists of different sorts (see Sophists), so it is understandable that under the general heading 'competitive' Thrasyllus characterized *Euthydemus* and *Gorgias* as dialogues of refutation, and *Protagoras* as a dialogue of display - presumably because Protagoras and Socrates are each portrayed as intent on showing off their debating skills. *Meno*, on the other hand, is labelled an elenctic work. It was followed by the seventh tetralogy: *Hippias Major* and *Hippias Minor*, two very different dialogues (of refutation, according to Thrasyllus), both featuring the sophist of that name; *Ion*, a curious piece on poetic performance; and *Menexenus*, a still more curious parody of a funeral oration, put in the mouth of Pericles' mistress Aspasia.

For the last two tetralogies Thrasyllus reserved some of Plato's major writings. The eighth contained the very brief (and conceivably spurious) *Clitophon*, in which a minor character from the *Republic* plays variations on themes in the *Republic*, the second dialogue in the group, and generally regarded nowadays as Plato's greatest work. This quartet was completed by *Timaeus* and its unfinished sequel *Critias*, no doubt because these dialogues represent themselves as pursuing further the discussions of the *Republic*. The pre-Copernican mathematical cosmology of *Timaeus* no longer attracts readers as it did throughout antiquity, and particularly in the Middle Ages, when the dialogue was for a period the only part of Plato's *œuvre* known to the Latin West. Finally, the ninth tetralogy began with the short *Minos*, a spurious dialogue taking up issues in the massive *Laws*, Plato's longest and probably latest work, which was put next in the group. Then followed *Epinomis*, an appendix to *Laws* already attributed to one of Plato's pupils in antiquity (Philip of Opous, according to a report in Diogenes Laertius, III 37). Last were placed the *Letters*, briefly discussed above.

3 Authenticity and chronology

Thrasyllus rejected from the canon a variety of minor pieces, some of which still survive through the manuscript tradition. Modern judgment concurs with the ancient verdict against them. It also questions or rejects some he thought genuinely Platonic. But we can be fairly sure that we still possess everything Plato wrote for publication.

Attempting to determine the authenticity or inauthenticity of ancient writings is a hazardous business. Egregious historical errors or anachronisms suffice to condemn a work, but except perhaps for the *Eighth Letter*, this criterion gets no purchase on the Platonic corpus. Stylistic analysis of various kinds can show a piece of writing to be untypical of an author's *œuvre*, without thereby demonstrating its inauthenticity: *Parmenides* is a notable example of this. Most of Plato's major dialogues are in fact attested as his by Aristotle. The difficult cases are short pieces such as *Theages* and *Clitophon*, and, most interestingly, three more extended works: the *Seventh Letter*, *Alcibiades I* and *Hippias Major*. Opinion remains divided on them. Some scholars detect crude or sometimes brilliant pastiche of Plato's style; a parasitic relationship with undoubtedly genuine dialogues; a philosophical crassness or a misunderstanding of Platonic positions which betrays the forger's hand. Yet why should Plato not for some particular purpose recapitulate or elaborate things he has said elsewhere? And perhaps he did sometimes write more coarsely or didactically or long-windedly than usual. Such assessments are inevitably matters of judgment, on which intelligent and informed readers will legitimately differ.

Prospects for an absolute chronology of Plato's writings are dim. There are no more than two or three references to datable contemporaneous events in the entire corpus (leaving aside the *Letters*). Relative chronology is another matter. Some dialogues refer back to others. A number of instances have been mentioned already, but we can add a clear reminiscence of *Meno* in *Phaedo* (72e-73b), and of *Parmenides* in both *Theaetetus* (183e-184a) and *Sophist*

(217c). According to one ancient tradition *Laws* was unfinished at Plato’s death, and Aristotle informs us that it was written after *Republic* (*Politics* 1264b24- 7), to which it appears to allude (see, for example, *Laws* 739a-e). Attempts have sometimes been made to find evidence, whether internal or external, for the existence of early versions of works we possess in different form (see for example Thesleff 1982). One example is the suggestion that Aristophanes’ comedy *Ecclesiazousae* or *Assembly of Women* (388 BC) was parodying an early version of book V of *Republic*. But while the idea that Plato may have revised some of his writings is plausible, concrete instances in which such revision is plainly the best explanation of the phenomena are hard to find. Even if they were not, it is unlikely that the consequences for relative chronology would be clear.

For over a century hopes for a general relative chronology of Plato’s writings have been pinned on the practice of stylistic analysis. This was pioneered by Lewis Campbell in his edition of *Sophist* and *Politicus*, published in 1867. His great achievement was to isolate a group of dialogues which have in common a number of features (added to by subsequent investigators) that set them apart from all the rest. *Timaeus*, *Critias*, *Sophist*, *Politicus*, *Philebus* and *Laws* turn out to share among other things a common technical vocabulary; a preference for certain particles, conjunctions, adverbs and other qualifiers over alternatives favoured in other dialogues; distinctive prose rhythms; and the deliberate attempt to avoid the combination of a vowel at the end of one word followed by another vowel at the beginning of the next. Since there are good independent reasons for taking *Laws* to be Plato’s last work, Campbell’s sextet is very likely the product of his latest phase of philosophical activity. Application of the same stylistic tests to the Platonic corpus as a whole, notably by Constantin Ritter (1888), established *Republic*, *Theaetetus* and *Phaedrus* as dialogues which show significantly more of the features most strongly represented in the late sextet than any others. There is general agreement that they must be among the works whose composition immediately precedes that of the *Laws* group, always allowing that *Republic* must have taken several years to finish, and that parts of it may have been written earlier and subsequently revised. *Parmenides* is ordinarily included with these three, although mostly on non-stylistic grounds.

Since Campbell’s time there have been repeated attempts by stylometrists to divide the remaining dialogues into groups, and to establish sequences within groups. The heyday of this activity was in the late nineteenth and early twentieth centuries. Since the 1950s there has been a revival in stylistic study, with the use of increasingly sophisticated statistical techniques and the resources of the computer and the database. Secure results have proved elusive. Most scholars would be happy to date *Phaedo*, *Symposium* and *Cratylus* to a middle period of Plato’s literary and philosophical work which may be regarded as achieving its culmination in *Republic*. But while this dating is sometimes supported by appeal to stylistic evidence, that evidence is in truth indecisive: the hypothesis of a middle period group of dialogues really rests on their philosophical affinities with *Republic* and their general literary character. The same can be said *mutatis mutandis* of attempts to identify a group assigned to Plato’s early period.

The cohesiveness of Campbell’s late group has not gone unchallenged. For example, in 1953 G.E.L. Owen mounted what for a while seemed to some a successful attack on his dating of *Timaeus* and *Critias*, on the ground that these dialogues belong philosophically in Plato’s middle period. Broadly speaking, however, stylistic studies have helped to establish an agreed chronological framework within which most debates about philosophical interpretation now take place. This is not to say however that there is unanimity either about the way Plato’s thought developed or about the importance of the notion of development for understanding his philosophical project or projects in the dialogues.

4 The Platonic dialogue

Who invented the philosophical dialogue, and what literary models might have inspired the invention, are not matters on which we have solid information. We do know that several of Socrates’ followers composed what Aristotle calls *Sōkratikoi logoi*, discourses portraying Socrates in fictitious conversations (see Socratic dialogues). The only examples which survive intact besides Plato’s are by Xenophon, probably not one of the earliest practitioners of the genre.

One major reason for the production of this literature was the desire to defend Socrates against the charges of irreligion and corrupting young people made at his trial and subsequently in Athenian pamphleteering, as well as the implicit charge of guilt by association with a succession of oligarchic politicians. Thus his devotion to the unstable and treacherous Alcibiades was variously portrayed in, for example, the first of the *Alcibiades* dialogues

ascribed to Plato and the now fragmentary *Alcibiades* of Aeschines of Sphettos, but both emphasized the gulf between Alcibiades' self-conceit and resistance to education and Socrates' disinterested concern for his moral wellbeing. The same general purpose informed the publication of versions of Socrates' speech (his 'apology') before the court by Plato, Xenophon and perhaps others. Writing designed to clear Socrates' name was doubtless a particular feature of the decade or so following 399 BC, although it clearly went on long after that, as in Xenophon's *Memorabilia* (see Xenophon §2). After starting in a rather different vein *Gorgias* turns into Plato's longest and angriest dialogue of this kind. Socrates is made to present himself as the only true politician in Athens, since he is the one person who can give a truly rational account of his conduct towards others and accordingly command the requisite political skill, which is to make the citizens good. But he foresees no chance of acquittal by a court of jurors seeking only gratification from their leaders.

Placing Socrates in opposition to Alcibiades is a way of defending him. Arranging a confrontation between a sophist (Protagoras or Hippias) or a rhetorician (Gorgias) or a religious expert (Euthyphro) or a Homeric recitalist (Ion) and Socrates is a way of exposing their intellectual pretensions, and in most cases their moral shallowness, while celebrating his wit, irony and penetration and permitting his distinctive ethical positions and ethical method to unfold before the reader's eyes. The elenchus (see Socrates §§3-4) is by no means the only mode of argument Socrates is represented as using in these fictional encounters. Plato particularly enjoys allowing him to exploit the various rhetorical forms favoured by his interlocutors. But it is easy to see why the dialogue must have seemed to Plato the ideal instrument not only for commemorating like Xenophon Socrates' style of conversation, but more importantly for exhibiting the logical structure and dynamic of the elenchus, and its power in Socrates' hands to demolish the characteristic intellectual postures of those against whom it is deployed.

In these dialogues of confrontation Socrates seldom succeeds in humbling his interlocutors into a frank recognition that they do not know what they thought they knew: the official purpose - simultaneously intellectual and moral - of the elenchus. It would not have been convincing to have him begin to convert historical figures with well-known intellectual positions. The main thing registered by their fictional counterparts is a sense of being manipulated into self-contradiction. In any case, the constructive response to the extraordinary figure of Socrates which Plato really wants to elicit is that of the reader. We have to suppose that, as conversion to philosophy was for Plato scarcely distinguishable from his response to Socrates (devotion to the man, surrender to the spell of his charisma, strenuous intellectual engagement with his thought and the questions he was constantly pursuing), so he conceived that the point of writing philosophy must be to make Socrates charismatic for his readers - to move us to similar devotion and enterprise. In short, the dialogues constitute simultaneously an invitation to philosophy and a critique of its intellectual rivals.

Whatever Plato's other accomplishments or failures as a writer and thinker, one project in which he unquestionably succeeds is in creating a Socrates who gets under the reader's skin (see Socrates §7). Plato has a genius for portrayal of character: the 'arrogant self-effacement' of Socrates' persona; the irony at once sincere and insincere; the intellectual slipperiness in service of moral paradox; the nobility of the martyr who loses everything but saves his own soul, and of the hero who stands firm on the battlefield or in face of threats by the authorities; relentless rationality and almost impregnable self-control somehow cohabiting with susceptibility to beautiful young men and their erotic charm. Also important is the ingenious variety of perspectives from which we see Socrates talking and interacting with others. Sometimes he is made to speak to us direct (for example, *Apology*, *Gorgias*). Sometimes Plato invites us to share complicity in a knowing narrative Socrates tells of his own performance (as in *Charmides*, *Protagoras*). Sometimes someone else is represented as recalling an unforgettably emotional occasion when Socrates dominated a whole roomful of people, as in the most powerfully dramatic dialogues of all, *Phaedo* and *Symposium*. Here we have the illusion that Socrates somehow remains himself even though the ideas advanced in them must go beyond anything that the historical Socrates (or at any rate the agnostic Socrates of *Apology*) would have claimed about the soul and its immortality or about the good and the beautiful.

5 The problem of writing

It might seem strange that an original philosopher of Plato's power and stature should be content, outside the *Letters* if some of them are by him, never to talk directly to the reader, but only through the medium of narrative or dramatic fiction, even granted the pleasure he plainly takes in exhibiting his mastery of that medium. This will become less mysterious if we reflect further on Socrates and Socratic questioning. At any rate by the time of the

Meno, Plato was wanting to suggest that the elenchus presupposes that understanding is not something one person can transmit in any straightforward way to another, but something which has to be worked out for oneself and recovered from within by recollection. The suggestion is made by means of an example from mathematics, where it is transparently true that seeing the answer to a problem is something that nobody else can do for us, even if Socrates' questions can prompt us to it. The moral we are to draw is that in pressing his interlocutors on what they say they believe, Socrates is merely an intellectual midwife assisting them to articulate for themselves a more coherent and deeply considered set of views, which will ideally constitute the truth.

The Platonic dialogue can be interpreted as an attempt to create a relationship between author and reader analogous to that between Socrates and his interlocutors. Given that that relationship is to be construed in the way indicated in *Meno*, the point of a dialogue will be like that of the elenchus: not to teach readers the truth (it is strictly speaking unteachable), but to provoke and guide them into working at discovering it for themselves. Most of the dialogues of Campbell's late sextet are admittedly more didactic than one would expect on this view of the dialogue, and it is significant that except in *Philebus* Socrates is no longer the main speaker. Yet even here use of the dialogue form can be taken as symbolizing that responsibility for an active philosophical engagement with what Plato has written rests with the reader, as the difficulty and in some cases the methodological preoccupations of most of these works confirms.

In a much discussed passage at the end of *Phaedrus* (275-8), Socrates is made to speak of the limitations of the written word. It can answer no questions, it cannot choose its readers, it gets misunderstood with no means of correcting misunderstanding. Its one worthwhile function is to remind those who know of what they know. By contrast with this dead discourse live speech can defend itself, and will be uttered or not as appropriate to the potential audience. The only serious use of words is achieved when speech, not writing, is employed by dialecticians to sow seeds of knowledge in the soul of the learner. If they commit their thoughts to writing they do so as play (*paidia*). The *Seventh Letter* (341-2) makes related remarks about the writing of philosophy; and at various points in, for example, *Republic*, *Timaeus* and *Laws*, the discussions in which the interlocutors are engaged are described as play, not to be taken seriously.

Interpreters have often taken these written remarks about writing with the utmost seriousness. In particular the Tübingen school of Platonic scholarship has connected them with references, especially in Aristotle, to unwritten doctrines of Plato. They have proposed that the fundamental principles of his philosophy are not worked out in the dialogues at all, but were reserved for oral discussions in the Academy, and have to be reconstructed by us from evidence about the unwritten doctrines. But this evidence is suspect where voluble and elusive when apparently more reliable. There are two star exhibits. First, according to the fourth century BC music theorist Aristoxenus, Aristotle used to tell of how when Plato lectured on the good he surprised and disappointed his listeners by talking mostly about mathematics (*Harmonics II*, 30.16-31.3). Second, at one point in the *Physics* (209b13-6) Aristotle refers to Plato's 'so-called unwritten teachings'; and the Aristotelian commentators report that Aristotle and other members of the Academy elsewhere wrote more about them. Plato's key idea was taken to be the postulation of the One and the great and the small, or 'indefinite dyad' as principles of all things, including Forms. In his *Metaphysics* (I.6) Aristotle seems to imply that in this theory the Forms were construed in some sense as numbers. It remains obscure and a subject of inconclusive scholarly debate how far the theory was worked out, and what weight we should attach to it in comparison to the metaphysical explorations of the dialogues of Plato's middle and late periods (see for example Ross 1951, Gaiser 1968, Guthrie 1978, Gaiser 1980, Burnyeat 1987).

The general issue of how far we can ascribe to Plato things said by interlocutors (principally Socrates) in his dialogues is something which exercises many readers. The position taken in this entry will be that no single or simple view of the matter is tenable: sometimes, for example, Plato uses the dialogue form to work through a problem which is vexing him; sometimes to recommend a set of ideas to us; sometimes to play teasingly with ideas or positions or methodologies without implying much in the way of commitment; and frequently to suggest to us ways we should or should not ourselves try to philosophize. As for the Tübingen school, we may agree with them that when it introduces the Form of the Good the *Republic* itself indicates that readers are being offered only conjectures and images, not the thorough dialectical discussion necessary for proper understanding. But the notions of seriousness and play are less straightforward than they allow. Playing with ideas - that is, trying them out and developing them to see what might work and what will not - is the way new insights in philosophy and science are often discovered. When we meet it in Plato's dialogues it usually seems fun without being frivolous.

Nor should we forget that the Platonic dialogue represents itself as a spoken conversation. It seems hard to resist the thought that we are thereby invited to treat his dialogues not as writing so much as an attempt to transcend the limitations of writing. Perhaps the idea is that they can achieve the success of living speech if treated not as texts to be interpreted (despite Plato's irresistible urge to produce texts devised precisely to elicit attempts at interpretation), but as stimuli to questions we must put principally to ourselves, or as seeds which may one day grow into philosophy in our souls.

6 Early works

There is widespread scholarly agreement that the following are among Plato's earliest writings: *Apology*, *Crito*, *Ion*, *Hippias Minor*, *Laches* and *Charmides*. *Apology*, as we have noted, best fits into the context of the decade following Socrates' death, and so does *Crito*, which explores the question why he did not try to escape from the condemned cell; the others are all short treatments of questions to do with virtue and knowledge, or in the case of *Ion*, with expertise (*technē*), and all are relatively simple in literary structure. The brief *Euthyphro* and the much longer *Protagoras* and *Gorgias* (with which *Menexenus* is often associated) are usually seen as having many affinities with these, and so are put at least fairly early, although here anticipations of the style or content of the mature middle-period dialogues have also been detected. The connections in thought between *Lysis*, *Euthydemus* and *Hippias Major* and middle-period Plato may be argued to be stronger still, even though there remain clear similarities with the dialogues generally accepted as early. We do not know whether Plato wrote or published anything before Socrates' death; *Menexenus* cannot be earlier than 386 BC, *Ion* might be datable to around 394-391 BC, but otherwise we can only guess.

All those listed above fall under the commonly used description 'Socratic dialogues', because they are seen as preoccupied with the thought of the historical Socrates as Plato understood him, in contrast with writings of the middle period, where 'Socrates' often seems to become a vehicle for exploring a more wide-ranging set of ideas (see Socrates §2). In the Socratic dialogues discussion is confined almost exclusively to ethical questions, or problems about the scope and credentials of expertise: metaphysics and epistemology and speculation about the nature and powers of the soul are for the most part notable by their absence. Use of the elenchus is prominent in them as it is not, for example, in *Republic* (apart from book I, sometimes regarded as an early work subsequently reused as a preface to the main body of the dialogue). The hypothesis that philosophizing in this style was the hallmark of the historical Socrates is broadly consistent with what we are given to understand about him by Xenophon, Aristotle and Plato's *Apology* - which is usually thought to be particularly authoritative evidence, whether or not it is a faithful representation of what Socrates really said at his trial.

How historical the historical Socrates of the hypothesis actually is we shall never know. The conjecture that many of the Socratic dialogues are early works is likewise only a guess, which gets no secure support from stylometric evidence. None the less the story of Plato's literary and philosophical development to which it points makes such excellent sense that it has effectively driven all rival theories from the field. The placing of individual dialogues within that story remains a matter for controversy; and doubts persist over how far interpretation of Plato is illuminated or obstructed by acceptance of any developmental pattern. With these provisos, the account which follows assumes the existence of a group of early Socratic dialogues in the sense explained.

The convenience of the description 'Socratic dialogues' should not generate the expectation of a single literary or philosophical enterprise in these writings. It conceals considerable variety, for example as between works devoted to articulating and defending the philosophical life and works which problematize Socratic thought as much as they exhibit its attractions. This distinction is not an exhaustive one, but provides useful categories for thinking about some of the key productions of Plato's early period.

7 Apologetic writings

Moral, or indeed existential, choice, to use an anachronistic expression, is the insistent focus of *Apology*. God has appointed Socrates, as he represents it to his judges, to live the philosophical life, putting himself and others under constant examination. The consistency of his commitment to this mission requires him now to face death rather than abandon his practice of philosophy, as he supposes for the sake of argument the court might require him to do. For confronted with the choice between disobeying God (that is, giving up philosophy) and disobeying human dictate (that is, refusing to do so), he can only take the latter option. What governs his choice is justice:

> It is a mistake to think that a man worth anything at all should make petty calculations about the risk of living or dying. There is only one thing for him to consider when he acts: whether he is doing right or wrong, whether he is doing what a good man or a bad man would do.
>
> (*Apology* 28b)

Whether death is or is not a bad thing Socrates says he does not know. He does know that behaving wrongly and disobeying one's moral superior - whether divine or human - is bad and shameful. The demands of justice, as his conscience (or 'divine sign') interpreted them, had earlier led him to choose the life of a private citizen, conversing only with individuals, rather than the political life: for justice and survival in politics are incompatible. When he did carry out the public obligations of a citizen and temporarily held office, justice again compelled him to choose the dangerous and unpopular course of resisting a proposal that was politically expedient but contrary to the law. As for those with whom he talked philosophy, they too faced a choice: whether to make their main concern possessions and the body, or virtue and the soul; that is, what belongs to oneself, or oneself. And now the judges too must choose and determine what is just as their oath requires of them.

Crito and *Gorgias* continue the theme in different ways. *Crito* has often been found difficult to reconcile with *Apology* when it argues on various grounds (paternalistic and quasi-contractual) that citizens must always obey the law, unless they can persuade it that it is in the wrong. Hence, since the law requires that Socrates submit to the punishment prescribed by the court, he must accept the sentence of death pronounced on him. The higher authority of divine command stressed in *Apology* seems to have been forgotten. Once again, however, the whole argument turns on appeal to justice and to the choices it dictates: we must heed the truth about it, not what popular opinion says; we must decide whether or not we believe the radical Socratic proposition that retaliation against injury or injustice is never right (see Socrates §4). *Gorgias*, one of the longest of all the dialogues, ranges over a wide territory, but at its heart is the presentation of a choice. Socrates addresses Callicles, in whose rhetoric Nietzsche saw an anticipation of his ideal of the superman:

> You see that the subject of our arguments - and on what subject should a person of even small intelligence be more serious? - is this: what kind of life should we live? The life which you are now urging upon me, behaving as a *man* should: speaking in the assembly and practising rhetoric and engaging in politics in your present style? Or the life of philosophy?
>
> (*Gorgias* 500c)

The dialogue devotes enormous energy to arguing that only philosophy, not rhetoric, can equip us with a true expertise which will give us real power, that is power to achieve what we want: the real not the apparent good. Only philosophy can articulate a rational and reliable conception of happiness - which turns out to depend on justice.

8 *Laches* and *Charmides*

Contrast the works outlined in §7 with *Laches* and *Charmides*, which were very likely conceived as a pair, the one an inquiry into courage, the other into *sōphrosynē* or moderation. Both engage in fairly elaborate scene setting quite absent from *Crito* and *Gorgias*. In both there is concern with the relation between theory and practice, which is worked out more emphatically in *Laches*, more elusively in *Charmides*. For example, in *Laches* Socrates is portrayed both as master of argument about courage, and as an exemplar of the virtue in action - literally by reference to his conduct in the retreat from Delium early in the Peloponnesian War, metaphorically by his persistence in dialectic, to which his observations on the need for perseverance in inquiry draw attention.

A particularly interesting feature of these dialogues is their play with duality. Socrates confronts a *pair* of main interlocutors who clearly fulfil complementary roles. We hear first the views of the more sympathetic members of the two pairs: the general Laches, whom Socrates identifies as his partner in argument, and the young aristocrat Charmides, to whom he is attracted. Each displays behavioural traits associated with the virtue under discussion, and each initially offers a definition in behavioural terms, later revised in favour of a dispositional analysis: courage is construed as a sort of endurance of soul, *sōphrosynē* as modesty. After these accounts are subjected to elenchus and refuted, the other members of the pairs propose intellectualist definitions: according to Nicias (also a general), courage is knowledge of what inspires fear or confidence, while Critias identifies *sōphrosynē* with self-knowledge.

Broad hints are given that the real author of these latter definitions is Socrates himself; and in *Protagoras* he is made to press Protagoras into accepting the same definition of courage. There are also hints that, as understood by their proponents here, this intellectualism is no more than sophistic cleverness, and that neither possesses the virtue he claims to understand. Both are refuted by further Socratic elenchus, and in each case the argument points to the difficulty of achieving an intellectualist account which is not effectively a definition of virtue in general as the simple knowledge of good and bad. *Laches* explicitly raises the methodological issue of whether one should try to investigate the parts of virtue in order to understand the whole or vice versa (here there are clear connections with the main argument of *Protagoras*).

Aristotle was in no doubt that Socrates 'thought all the virtues were forms of knowledge' (*Eudemian Ethics* 1216b6); and many moves in the early dialogues depend on the assumption that if you know what is good you will *be* good (see Socrates §5). But *Laches* and *Charmides* present this Socratic belief as problematical. Not only is there the problem of specifying a unique content for the knowledge with which any particular virtue is to be identified. There is also the difficulty that any purely intellectual specification of what a virtue is makes no reference to the dispositions Charmides and Laches mention and (like Socrates) exemplify. In raising this difficulty Plato is already adumbrating the need for a more complex moral psychology than Socrates', if only to do justice to how Socrates *lived*. If the viewpoints of Laches and Nicias are combined we are not far from the account of courage in *Republic*, as the virtue of the spirited part of the soul, which 'preserves through pains and pleasures the injunctions of reason concerning what is and is not fearful' (442b).

9 Other dialogues of inquiry

In *Protagoras* it is Socrates himself who works out and defends the theory that knowledge is sufficient for virtuous action and that different virtues are different forms of that knowledge (see Aretē). He does not here play the role of critic of the theory, nor are there other interlocutors who might suggest alternative perceptions: indeed Protagoras, as partner not adversary in the key argument, is represented as accepting the key premise that (as he puts it) 'wisdom and knowledge are the most powerful forces governing human affairs' (352c-d). It would be a mistake to think that Plato found one and the same view problematic when he wrote *Laches* and *Charmides* but unproblematic when he wrote *Protagoras*, and to construct a chronological hypothesis to cope with the contradiction. *Protagoras* is simply a different sort of dialogue: it displays Socratic dialectic at work from a stance of some detachment, without raising questions about it. *Protagoras* is an entirely different kind of work from *Gorgias*, too: the one all urbane sparring, the latter a deadly serious confrontation between philosophy and political ambition. *Gorgias* unquestionably attacks hedonism, *Protagoras* argues for it, to obtain a suitable premise for defending the intellectualist paradox that nobody does wrong willingly, but leaves Socrates' own commitment to the premise at best ambiguous (see Socrates §6). Incommensurabilities of this kind make it unwise to attempt a relative chronology of the two dialogues on the basis of apparent incompatibilities in the positions of their two Socrates.

Space does not permit discussion of *Ion*, or of *Hippias Minor*, in which Socrates is made to tease us with the paradox - derived from his equation of virtue and knowledge - that someone who *did* do wrong knowingly and intentionally would be better than someone who did it unintentionally through ignorance. Interpretation of *Euthyphro* remains irredeemably controversial. Its logical ingenuity is admired, and the dialogue is celebrated for its invention of one of the great philosophical questions about religion: either we should do right because god tells us to do so, which robs us of moral autonomy, or because it is right god tells us to do it, which makes the will of god morally redundant.

Something more needs to be said about *Lysis* and *Euthydemus* (which share a key minor character in Ctesippus, and are heavy with the same highly charged erotic atmosphere) and *Hippias Major*. They all present Socrates engaging in extended question and answer sessions, although only in *Hippias* is this an elenchus with real bite: in the other dialogues his principal interlocutors are boys with no considered positions of their own inviting refutation. All end in total failure to achieve positive results. All make great formal play with dualities of various kinds. Unusually ingenious literary devices characterize the three works, ranging from the introduction of an *alter ego* for Socrates in *Hippias* to disruption of the argument of the main dialogue by its 'framing' dialogue in *Euthydemus*, at a point where the discussion is clearly either anticipating or recalling the central books of *Republic*. All seem to be principally preoccupied with dialectical method (admittedly a concern in every dialogue). Thus *Hippias* is a study in definitional procedure, applied to the case of the fine or beautiful, *Lysis* a study in thesis

and antithesis paralleled in Plato's *œuvre* only by *Parmenides*, and *Euthydemus* an exhibition of the contrast between 'eristic', that is, purely combative sophistical argument, demonstrated by the brothers Euthydemus and Dionysodorus, and no less playful philosophical questioning that similarly but differently ties itself in knots. It is the sole member of the trio which could be said with much conviction to engage - once more quizzically - with the thought of the historical Socrates about knowledge and virtue. But its introduction of ideas from *Republic* makes it hard to rank among the early writings of Plato. Similarly, in *Lysis* and *Hippias Major* there are echoes or pre-echoes of the theory of Forms and some of the causal questions associated with it. We may conclude that these ingenious philosophical exercises - 'gymnastic' pieces, to use the vocabulary of *Parmenides* - might well belong to Plato's middle period.

10 The introduction of Platonism

Needless to say, no explicit Platonic directive survives encouraging us to read *Meno*, *Symposium* and *Phaedo* together. But there are compelling reasons for believing that Plato conceived them as a group in which *Meno* and *Symposium* prepare the way for *Phaedo*. In brief, in *Meno* Plato introduces his readers to the non-Socratic theory of the immortality of the soul and a new hypothetical method of inquiry, while *Symposium* presents for the first time the non-Socratic idea of a Platonic Form, in the context of a notion of philosophy as desire for wisdom. It is only in *Phaedo* that all these new ideas are welded together into a single complex theory incorporating epistemology, psychology, metaphysics and methodology, and constituting the distinctive philosophical position known to the world as Platonism.

Meno and *Symposium* share two features which indicate Plato's intention that they should be seen as a pair, performing the same kind of introductory functions, despite enormous differences for example in dialogue form, scale and literary complexity. First, both are heavily and specifically foreshadowed in *Protagoras*, which should accordingly be reckoned one of the latest of Plato's early writings. At the end of *Protagoras* (361c) Socrates is made to say that he would like to follow up the inconclusive conversation of the dialogue with another attempt to define what virtue is, and to consider again whether or not it can be taught. This is exactly the task undertaken in *Meno*. Similarly, not only are all the *dramatis personae* of *Symposium* except Aristophanes already assembled in *Protagoras*, but at one point Socrates is represented as offering the company some marginally relevant advice on how to conduct a drinking party - which corresponds exactly to what happens at the party in *Symposium* (347c-348a).

Second, both *Meno* and *Symposium* are exceedingly careful not to make Socrates himself a committed proponent either of the immortality of the soul or of the theory of Forms. These doctrines are ascribed respectively to 'priests and priestesses' (*Meno*) and to one priestess, Diotima, in particular (*Symposium*); in *Meno* Socrates says he will not vouch for the truth of the doctrine of immortality, in *Symposium* he records Diotima's doubts as to whether he is capable of initiation into the mysteries (a metaphor also used of mathematics in *Meno*) which culminate in a vision of the Form of the Beautiful. In *Symposium* these warning signs are reinforced by the extraordinary form of the dialogue: the sequence of conversations and speeches it purports to record are nested inside a Chinese box of framing conversations, represented as occurring some years later and with participants who confess to inexact memory of what they heard.

Phaedo for its part presupposes *Meno* and *Symposium*. At 72e-73b *Meno*'s argument for the immortality of the soul is explicitly recalled, while the Form of Beauty is regularly mentioned at the head of the lists of the 'much talked about' Forms which *Phaedo* introduces from time to time (for example, 75c, 77a, 100b). It is as though Plato relies upon our memory of the much fuller characterization of what it is to be a Form supplied in *Symposium*. Unlike *Meno* and *Symposium*, *Phaedo* represents Socrates himself as committed to Platonist positions, but takes advantage of the dramatic context - a discussion with friends as he waits for the hemlock to take effect - and makes him claim prophetic knowledge for himself like a dying swan (84e-85b). The suggestion is presumably that Platonism is a natural development of Socrates' philosophy even if it goes far beyond ideas about knowledge and virtue and the imperatives of the philosophical life to which he is restricted in the early dialogues.

11 *Meno*

Meno is a dialogue of the simplest form and structure. It consists of a conversation between Socrates and Meno, a young Thessalian nobleman under the spell of the rhetorician Gorgias, interrupted only by a passage in which

Socrates quizzes Meno's slave, and then later by a brief intervention in the proceedings on the part of Anytus, Meno's host and one of Socrates' accusers at his trial. The dialogue divides into three sections: an unsuccessful attempt to define what virtue is, which makes the formal requirements of a good definition its chief focus; a demonstration in the face of Meno's doubts that successful inquiry is none the less possible in principle; and an investigation into the secondary question of whether virtue can be taught, pursued initially by use of a method of hypothesis borrowed from mathematics. Although the ethical subject matter of the discussion is thoroughly Socratic, the character and extent of its preoccupation with methodology and (in the second section) epistemology and psychology are not. Nor is *Meno*'s use of mathematical procedures to cast light on philosophical method; this is not confined to the third section. Definitions of the mathematical notion of shape are used in the first section to illustrate for example the principle that a definition should be couched in terms that the interlocutor agrees are already known. And the demonstration of an elenchus with a positive outcome which occupies the second is achieved with a geometrical example.

It looks as though Plato has come to see in the analogy with mathematics hope for more constructive results in philosophy than the Socratic elenchus generally achieved in earlier dialogues. This is a moral which the second and third sections of *Meno* make particularly inviting to draw. In the second Socrates is represented as setting Meno's untutored slave boy a geometrical problem (to determine the length of the side of a square twice the size of a given square) and scrutinizing his answers by the usual elenctic method. The boy begins by thinking he has the answer. After a couple of mistaken attempts at it he is persuaded of his ignorance. So far so Socratic. But then with the help of a further construction he works out the right answer, and so achieves true opinion, which it is suggested could be converted into knowledge if he were to go through the exercise often. The tacit implication is that if elenchus can reach a successful outcome in mathematics, it ought to be capable of it in ethics too.

None the less direct engagement with the original problem of what virtue is is abandoned, and the discussion turns to the issue of its teachability, and to the method of hypothesis. Here the idea is that instead of investigating the truth of proposition *p* directly 'you hit upon another proposition *h* ('the hypothesis'), such that *p* is true if and only if *h* is true, and then investigate the truth of *h*, undertaking to determine what would follow (quite apart from *p*) if *h* were true and, alternatively, if it were false' (Gregory Vlastos' formulation (1991)). After illustrating this procedure with an exceedingly obscure geometrical example, Socrates makes a lucid application of it to the ethical problem before them, and offers the Socratic thesis that virtue is knowledge as the hypothesis from which the teachability of virtue can be derived. The subsequent examination of this hypothesis comes to conclusions commentators have found frustratingly ambiguous. But the survival and development of the hypothetical method in *Phaedo* and *Republic* are enough to show Plato's conviction of its philosophical potential.

The slave boy episode is originally introduced by Socrates as a proof of something much more than the possibility of successful inquiry. The suggestion is that the best explanation of that possibility is provided by the doctrine of the immortality of the soul, a Pythagorean belief which makes the first of its many appearances in Plato's dialogues in *Meno* (see Psychē; Pythagoras §2; Pythagoreanism §3). More specifically, the idea as Socrates presents it is that the soul pre-exists the body, in a condition involving conscious possession of knowledge. On entry into the body it forgets what it knows, although it retains it as latent memory. Discovery of the sort of a priori knowledge characteristic of mathematics and (as Plato supposes) ethics is a matter of recollecting latent memory. This is just what happens to the slave boy: Socrates does not impart knowledge to him; he works it out for himself by recovering it from within. Once again, although the Socrates of *Meno* does not in the end subscribe to belief in learning as recollection of innate knowledge, it is embraced without equivocation in *Phaedo*, as also in the later *Phaedrus*. But *what* exactly is recollected? *Phaedo* will say: knowledge of Forms. *Meno* by contrast offers no clues. The introduction of the theory of Forms is reserved for *Symposium*.

12 *Symposium*

Symposium has the widest appeal of all Plato's writings. No work of ancient Greek prose fiction can match its compulsive readability. Plato moves through a rich variety of registers, from knockabout comedy and literary parody to passages of disturbing fantasy or visionary elevation, culminating in a multiply paradoxical declaration of love for Socrates put in the mouth of a drunken Alcibiades. Love (*erōs*) is the theme of the succession of *encōmia* or eulogies delivered at the drinking party (*symposion*) hosted by the playwright Agathon: not sublimated 'Platonic' love between the sexes, but the homoerotic passion of a mature man for a younger or indeed a teenager.

This continues until Aristophanes (one of the guests) and Socrates broaden and transform the discussion. Socrates' speech, which is a sort of anti-eulogy, develops a general theory of desire and its relation to beauty, and it is in this context that the idea of an eternal and changeless Form makes its first unequivocal appearance in Plato's *œuvre*. Thus Plato first declares himself a metaphysician not in a work devoted to philosophical argument, but in a highly rhetorical piece of writing, albeit one in which fashionable models of rhetoric are subverted.

Love and beauty are first connected in some of the earlier *encōmia*, and notably in Agathon's claim that among the gods 'Love is the happiest of them all, for he is the most beautiful and best' (195a). This thesis is subjected to elenchus by Socrates in the one argumentative section of the dialogue. Agathon is obliged to accept that love and desire are necessarily love and desire *for something*, namely, something they are in need of. Following his concession Socrates argues that beauty is not what love possesses but precisely the thing it is in need of. This argument constitutes the key move in the philosophy of the dialogue, which Plato elaborates in various ways through the medium of Diotima, the probably fictitious priestess from whom Socrates is made to claim he learned the art of love in which he has earlier (177d) claimed expertise. First she tells a myth representing Love as the offspring of poverty and resource, and so - according to her interpretation - occupying the dissatisfied intermediate position between ignorance and wisdom which characterizes philosophy: hence presumably the explanation of Socrates' claim to be an expert in love, since the pursuit of wisdom turns out to be the truest expression of love. Then she spells out the theoretical basis for this intellectualist construction of what love is. The theory has rightly been said to combine 'a psychology that is strictly or loosely Socratic with a metaphysics that is wholly Platonic' (Price 1995).

This psychology holds that a person who desires something wants not so much the beautiful as the good, or more precisely happiness conceived as permanent possession of the good. Love is a particular species of desire, which occurs when perception of beauty makes us want to reproduce. (Socrates is made to express bafflement at this point: presumably an authorial device for indicating that Diotima's line of thought is now moving beyond anything Plato considered strictly Socratic.) Diotima goes on to explain that reproduction is the way mortal animals pursue immortality, interpreted in its turn in terms of the longing for permanent possession of good with which she has just identified desire. Other animals and many humans are content with physical reproduction, but humans are capable of *mental* creation when inspired by a beautiful body, and still more by a beautiful soul or personality. This is how the activities of poets and legislators and the virtuous are to be understood.

Perhaps Plato thought these ideas, although no longer Socratic, provided a convincing explanation of the drive which powered Socrates' philosophical activity in general, and made him spend so much time with beautiful young men in particular. However that may be, in what follows he has Diotima speak of greater mysteries which 'I do not know whether you [that is, Socrates] would be able to approach'. These are the subject of a lyrical account of how a true lover moves step by step from preoccupation with the beauty of a single beloved, to appreciating that there is one and the same beauty in all bodies and so loving them all, and then to seeing and loving beauty in souls or personalities and all manner of mental creations, until he 'turns to the great sea of beauty, and gazing upon this gives birth to many gloriously beautiful ideas and theories, in unstinting love of wisdom [that is, philosophy]' (210d). The final moment of illumination arrives when the philosopher-lover grasps the Beautiful itself, an experience described as the fulfilment of all earlier exertions. Unlike other manifestations of beauty the Form of the Beautiful is something eternal, whose beauty is not qualified in place or time or relation or respect. It is just the one sort of thing it is, all on its own, whereas other things that are subject to change and decay are beautiful by participation in the Form. Only someone who has looked upon it will be capable of giving birth not to images of virtue (presumably the ideas and theories mentioned a little earlier), but to virtue itself, and so achieving immortality so far as any human can.

It is striking that the doctrine of the immortality of the soul forms no part of Diotima's argument. If we assume the scholarly consensus that *Symposium* postdates *Meno*, this poses something of a puzzle. One solution might be to suppose that, although *Meno* presents the doctrine, Plato is himself not yet wholly convinced of its truth, and so gives it no role in his account of the desire for immortality in *Symposium*. This solution might claim support from the fact that *Phaedo* takes upon itself the task of arguing the case for the immortality of the soul much more strenuously than in *Meno*, and in particular offers a much more careful and elaborate version of the argument from recollection. Additionally or alternatively, we may note that when Plato presents the doctrine of the immortality of the soul in the dialogues, he always treats it as something requiring explicit proof, unlike the theory of Forms,

which generally figures as a hypothesis recommending itself by its explanatory power or its ability to meet the requirements of Plato’s epistemology. Since Diotima’s discourse is not constructed as argument but as the explication of an idea, it is not the sort of context which would readily accommodate the kind of demonstration Plato apparently thought imperative for discussion of the immortality of the soul.

13 *Phaedo*

The departure point for *Phaedo*’s consideration of the fate of the soul after death is very close to that idea of love as desire for wisdom which Diotima offers at the start of her speech in *Symposium*. For Socrates starts with the pursuit of wisdom, which he claims is really a preparation for death. This is because it consists of an attempt to escape the restrictions of the body so far as is possible, and to purify the soul from preoccupation with the senses and physical desires so that it can think about truth, and in particular about the Forms, which are accessible not to sense perception but only to thought. Pure knowledge of anything would actually require complete freedom from the body. So given that death is the separation of soul from body, the wisdom philosophers desire will be attainable in full only when they are dead. Hence for a philosopher death is no evil to be feared, but something for which the whole of life has been a training. The unbearably powerful death scene at the end of the dialogue presents Socrates as someone whose serenity and cheerfulness at the end bear witness to the truth of this valuation.

Symposium implied that a long process of intellectual and emotional reorientation was required if someone was to achieve a grasp of the Form of Beauty. *Phaedo* has sometimes been thought to take a different view: interpreters may read its argument about recollecting Forms as concerned with the general activity of concept formation in which we all engage early in life. In fact the passage restricts recollection of Forms to philosophers, and suggests that the knowledge they recover is not the basic ability to deploy concepts (which Plato seems in this period to think a function of sense experience), but hard-won philosophical understanding of what it is to be beautiful or good or just. The interlocutors voice the fear that once Socrates is dead there will be nobody left in possession of that knowledge; and the claim that pure knowledge of Forms is possible only after death coheres with the *Symposium* account very well, implying as it does that the path to philosophical enlightenment is not just long but a journey which cannot be completed in this life.

The proposal that the soul continues to exist apart from the body after death is immediately challenged by Socrates’ interlocutors. Much of the rest of *Phaedo* is taken up with a sequence of arguments defending that proposal and the further contention that the soul is immortal, pre-existing the body and surviving its demise for ever. The longest and most ambitious of these arguments is the last of the set. It consists in an application of the method of hypothesis, which is explained again in a more elaborate version than that presented in *Meno*. The hypothesis chosen is the theory of Forms, or rather the idea that Forms function as explanations or causes of phenomena: beautiful things are beautiful by virtue of the Beautiful, large things large by virtue of the Large, and so on. Socrates is made to represent his reliance on this apparently uninformative or ’safe and simple’ notion of causation as a position he has arrived at only after earlier intellectual disappointments: first with the inadequacies of Presocratic material causes, then with the failure of Anaxagoras’ promise of a teleological explanation of why things are as they are (see Anaxagoras §4).

He soon goes on to argue however that the hypothesis can be used to generate a more sophisticated model of causation. Instead of proposing merely that (for example) hot things are hot by virtue of the Hot, we may legitimately venture the more specific explanation: ‘Hot things are hot by virtue of fire’, provided that it is true that wherever fire exists, it always heats things in its vicinity, being itself hot and never cold. After elaborating this point Socrates is ready to apply the model to the case of life and soul. By parity of reasoning, we may assert that living things are alive not just in virtue of life, but in virtue of soul, given that wherever soul exists it makes things it occupies alive, being itself alive and never dead. From this assertion there appears to follow the conclusion whose derivation is the object of the exercise: if soul is always alive and never dead, it must be immortal (that is, incapable of death) and so imperishable.

Phaedo, like *Republic*, ends with a sombre myth of last judgment and reincarnation, designed primarily to drive home the moral implications of Plato’s distinctive version of soul-body dualism. It reminds us of the Pythagorean origins of the doctrine of the immortality of the soul. Yet the Platonism of *Phaedo* owes a great deal also to the metaphysics of Parmenides. Both here and in *Symposium* the characterization of Forms as simple eternal beings,

accessible only to thought, not the senses, and the contrast both dialogues make with the changing and contradictory world of phenomena, are couched in terms borrowed from Parmenides and the Eleatic tradition which he inaugurated. Platonism can accordingly be seen as the product of an attempt to understand a fundamentally Socratic conception of philosophy and the philosophical life in the light of reflection on these two powerful Presocratic traditions of thought, using the new methodological resources made available by geometry.

14 *Republic*

Republic is misleadingly titled. The Greek name of the dialogue is *Politeia*, which is the standard word for constitution or ordering of the political structure: ’political order’ would give a better sense of what Plato has in mind. There is a further and deeper complication. Once you start reading the dialogue you find that it is primarily an inquiry into justice, conceived as a virtue or moral excellence of individual persons. The philosophical task it undertakes is the project of showing that justice so conceived is in the best interests of the just person, even if it brings nothing ordinarily recognizable as happiness or success, or indeed (as with the sentence of death passed on Socrates) quite the opposite. Thus *Republic* carries forward the thinking about justice begun in early dialogues such as *Apology*, *Crito* and *Gorgias*. Why, then, the title’s suggestion that it is a work of political rather than moral philosophy?

One way of answering this question is to attend to the formal structure of *Republic*. After book I, an inconclusive Socratic dialogue which none the less introduces, particularly in the conversation with Thrasymachus, many of the themes pursued in the rest of the work, the interlocutors agree to take an indirect approach to the problem of individual justice: they will consider the nature of justice and injustice in the *polis*, that is the (city-)state, in the hope that it will provide an illuminating analogy. Books II-IV spell out the class structure required in a ’good city’. It is suggested that in such a state political justice consists in the social harmony achieved when each class (economic, military, governing) performs its own and only its own function. This model is then applied to the individual soul (see Psychē). Justice and happiness for an individual are secured when each of the parts of the soul (appetite, emotion, reason) performs the role it should in mutual harmony. In working out the idea of psychic harmony, Plato formulates a conception of the complexity of psychological motivation, and of the structure of mental conflict, which leaves the simplicities of Socratic intellectualism far behind, and one which has reminded interpreters of Freudian theory, particularly in books VIII-IX. Here he examines different forms of *un*just political order (notably oligarchy, democracy and tyranny) and corresponding conditions of order, or rather increasing *dis*order, in the soul.

Political theory therefore plays a large part in the argument of the dialogue, even though the ultimate focus is the moral health of the soul, as is confirmed by the conclusion of book IX. Socrates suggests that it may not matter whether we can actually establish a truly just political order, provided we use the idea of it as a paradigm for founding a just city within our own selves.

This account of *Republic* omits the central books V-VII. These explore the notion of political order much further than is necessary for the purposes of inquiry into individual justice. This is where Plato develops the notion of a communistic governing class, involving the recruitment of talented women as well as men, the abolition of the family, and institution of a centrally controlled eugenic breeding programme. And it is where, in order to meet the problem of how the idea of the just city he has been elaborating might ever be put into practice, he has Socrates introduce philosopher-rulers:

> Unless either philosophers rule in our cities or those whom we now call rulers and potentates engage genuinely and adequately in philosophy, and political power and philosophy coincide, there is no end, my dear Glaucon, to troubles for our cities, nor I think for the human race.
>
> (*Republic* 473c-d)

What Plato perhaps has most in mind when he makes Socrates speak of ’troubles’ is as well as civil war the corruption he sees in all existing societies. As he acknowledges, this makes the emergence of an upright philosopher-ruler an improbability - and incidentally leaves highly questionable the prospects of anyone but a Socrates developing moral order within the soul when society without is infected with moral disorder.

Here we touch on another broadly political preoccupation of *Republic*, worked out at various places in the

dialogue. It offers among other things a radical critique of Greek cultural norms. This is highlighted in the censorship of Homer proposed in books II and III, and in the onslaught on the poets, particularly the dramatists, in book X, and in their expulsion from the ideal city. But these are only the more memorable episodes in a systematic attack on Greek beliefs about gods, heroes and the departed, on the ethical assumptions underlying music, dance and gymnastics (see Mimēsis), and again erotic courtship, and on medical and judicial practice. *Republic* substitutes its own austere state educational programme, initially focused on the training of the emotions, but subsequently (in books VI and VII) on mathematics and philosophy. Plato sees no hope for society or the human race without a wholesale reorientation, fostered by an absolute political authority, of all the ideals on which we set our hearts and minds.

Republic itself is written in such a way as to require the reader to be continually broadening perspectives on the huge range of concerns it embraces, from the banalities of its opening conversation between Socrates and the aged Cephalus to its Platonist explication of the very notion of philosophy in the epistemology and metaphysics of books V-VII. At the apex of the whole work Plato sets his presentation of the Form of the Good, as the ultimate goal of the understanding that philosophy pursues by use of the hypothetical method. The dialogue offers a symbol of its own progress in the potent symbol of the cave. We are like prisoners chained underground, who can see only shadows of images flickering on the wall. What we need is release from our mental shackles, and a conversion which will enable us gradually to clamber out into the world above and the sunlight. For then, by a sequence of painful reorientations, we may be able to grasp the Good and understand how it explains all that there is.

15 Critical dialogues

Parmenides is that rare phenomenon in philosophy: a self-critique. Plato here makes his own theory of Forms the subject of a penetrating scrutiny which today continues to command admiration for its ingenuity and insight. *Theaetetus* (datable to soon after 369 BC) also reverts to Plato’s critical manner. It applies an enriched variant of the Socratic elenchus to a sequence of attempts to define knowledge. The confidence of *Phaedo* and *Republic* that Platonist philosophers are in possession of knowledge and can articulate what it consists in is nowhere in evidence, except in a rhetorical digression from the main argument. Methodological preoccupations are dominant in both works. *Parmenides* suggests that to defend the Forms against its critique, one would need to be much more practised in argument than is their proponent in this dialogue (a young Socrates fictively encountering a 65-year old Parmenides and a middle-aged Zeno). And it sets out a specimen of the sort of exercise required, running to many pages of purely abstract reasoning modelled partly on the paradoxes of Zeno of Elea, partly on Parmenides’ deductions in the Way of Truth (see Parmenides §§3-8). *Theaetetus* likewise presents itself, initially more or less explicitly, later implicitly, as a model of how to go about testing a theory without sophistry and with due sympathy. While the conclusions achieved by this ’midwifery’ - as Socrates here calls it - are as devastatingly negative as in the early dialogues, we learn much more philosophy along the way. Many readers find *Theaetetus* the most consistently rewarding of all the dialogues.

A sketch of the principal concerns of the two dialogues will bring out their radical character. *Parmenides* raises two main questions about Forms. First, are there Forms corresponding to every kind of predicate? Not just *one* and *large*, or *beautiful* and *just*, familiar from the middle period dialogues, but *man* and *fire*, or even *hair* and *dirt*? Socrates is represented as unclear about the issue. Second, the idea that other things we call for example ’large’ or ’just’ are related to the Form in question by participation is examined in a succession of arguments which seek to show that, however Forms or the participation relation are construed, logical absurdities of one kind or another result. The most intriguing of these has been known since Aristotle as the Third Man: if large things are large in virtue of something distinct from them, namely the Form of Large, then the Large itself and the other large things will be large in virtue of *another* Form of Large - and so *ad infinitum*.

Theaetetus devotes much of its space to considering the proposal that knowledge is nothing but sense perception, or rather to developing and examining two theories with which that proposal is taken to be equivalent: the view of Protagoras (§3) that truth is relative, since ’man is the measure of all things’, and that of Heraclitus that everything is in flux, here considered primarily in application to the nature of sense perception. The dialogue is home to some of Plato’s most memorable arguments and analogies. For example, Protagoreanism is attacked by the brilliant (although perhaps flawed) self-refutation argument: if man is the measure of *all* things, then the doctrine of the relativity of truth is itself true only in so far as it is believed to be true; but since people in general believe it to be

false, it must be false. The next section of *Theaetetus* worries about the coherence of the concept of false belief. Here the soul is compared to a wax tablet, with false belief construed as a mismatch between current perceptions and those inscribed on the tablet, or again to an aviary, where false belief is an unsuccessful attempt to catch the right bird (that is, piece of knowledge). In the final section the interlocutors explore the suggestion that knowledge must involve the sort of complexity that can be expressed in a *logos* or statement. Socrates' 'dream' that such knowledge must be built out of unknowable simples fascinated Wittgenstein (§5), who saw in it an anticipation of the theory of his *Tractatus*.

Are we to infer that in opening or reopening questions of this kind Plato indicates that he is himself in a real quandary about knowledge and the Forms? Or is his main target philosophical complacency in his readers, as needing to be reminded that no position is worth much if it cannot be defended in strenuous argument? Certainly in the other two dialogues grouped here with *Parmenides* and *Theaetetus* the theory of Forms is again in evidence, presented as a view the author is commending to the reader's intellectual sympathies. *Cratylus* is a work whose closest philosophical connections are with *Theaetetus*, although its relative date among the dialogues is disputed. It is a pioneering debate between rival theories of what makes a word for a thing the right word for it: convention, or as Cratylus holds, a natural appropriateness - sound somehow mirroring essence (see Language, ancient philosophy of §2). Underlying Cratylus' position is an obscurely motivated commitment to the truth of Heracliteanism (see Cratylus). For present purposes what is of interest is the final page of the dialogue, which takes the theory of Forms as premise for an argument showing that the idea of an absolutely universal Heraclitean flux is unsustainable. As for *Phaedrus*, it contains one of the most elevated passages of prose about the Forms that Plato ever wrote.

The context is an exemplary rhetorical exercise in which *Symposium*'s treatment of the philosophical lover's attraction to beauty is reworked in the light of Republic's tripartition of the soul. Subsequently Plato has Socrates dismiss the speech as 'play', useful only for the methodological morals about rhetorical procedure we happen to be able to derive from it - together with a preceding denunciation of love by Socrates, capping one by his interlocutor Phaedrus - if we are dialecticians. This comment has led some readers to conjecture that Phaedrus accordingly marks Plato's formal leave-taking of the theory of Forms: in retrospect he sees it more as rhetoric than as philosophy or dialectic, which will henceforward confine itself to something apparently less inspiring - the patient, thorough, comprehensive study of similarities and differences. Yet *Phaedrus* is pre-eminently a dialogue written not to disclose its author's mind, but to make demands on the sophisticated reader's. Perhaps Socrates' great speech on the philosophical lover is 'play' not absolutely, but only relative to the controlling and unifying preoccupation of the dialogue, which is to work through a fresh examination of rhetoric, going beyond Gorgias in explaining how it can be a genuine form of expertise, based on knowledge of truth and variously geared to the various psychological types to which oratory addresses itself. We might speculate that Plato writes the speech as he does precisely because he thinks or hopes many of his readers will be of a type persuadable to the philosophical life by its vision of the soul's desire for the Beautiful.

16 Later dialogues

The theory of Forms also figures prominently in *Timaeus*. *Timaeus* is Plato's one venture into physical theory, and appropriately has in the Italian Greek Timaeus someone other than Socrates as main speaker. It is presented as an introduction to the story of Atlantis, allegedly an island power defeated by the prehistoric Athenians, and mentioned only by Plato among classical Greek authors. The conflict between Atlantis and Athens was to be the subject of *Critias*, conceived as a dialogue that would demonstrate the political philosophy of *Republic* in practice. But *Critias* was never completed, so *Timaeus* stands as an independent work.

The argument of *Timaeus* is based on the premise that the universe is not eternal but created - although debate has raged from antiquity onwards whether this means created in time, or timelessly dependent on a first cause. From the order and beauty of the universe Plato infers a good creator or craftsman (*dēmiourgos*), working on pre-existing materials (with their own random but necessary motions) from an eternal blueprint encoding life and intelligence: namely, the Form of Animal. The greater part of *Timaeus* consists in an account of how first the universe (conceived of as a living creature), then humans are designed from the blueprint for the best. Much use is made of mathematical models, for example for the movements of the heavenly bodies and the atomistic construction of the four elements. The account is presented as inevitably only a 'likely story', incapable of the

irrefutable truths of metaphysics.

There is no more austere or profound work of metaphysics in Plato’s *œuvre* than *Sophist*. Like many of the post-*Republic* dialogues it is ’professional’ philosophy, probably written primarily for Plato’s students and associates in the Academy. The style of *Sophist* and the remaining works to be discussed is syntactically tortuous and overloaded with abstraction and periphrasis; they are altogether lacking in literary graces or dramatic properties which might commend them to a wider readership. *Sophist*’s main speaker is a stranger from Elea, symbolizing the Parmenidean provenance of the problem at the heart of the long central section of the dialogue: how is it possible to speak of what is not (see Parmenides §2)? This puzzle is applied for example both to the unreality of images and to falsehood, understood as what is not the case. The solution Plato offers required some revolutionary moves in philosophical logic, such as the explicit differentiation of identity from predication, and the idea that subject and predicate play different roles in the syntax of the sentence. These innovations and their bearing on analysis of the verb ’to be’ have made *Sophist* the subject of some of the most challenging writing on Plato in the twentieth century.

The companion dialogue *Politicus* or *Statesman* addresses more squarely than *Republic* did the practical as distinct from the theoretical knowledge of the ideal statesman. Its contribution to this topic consists of three major claims. First is the rejection of the sovereignty of law. Plato has nothing against law as a convenient but imprecise rule of thumb in the hands of an expert statesman, provided it does not prevent him using his expertise. Making law sovereign, on the other hand, would be like preferring strict adherence to a handbook of navigation or a medical textbook to the judgment of the expert seafarer or doctor. If you have no such expert available, a constitution based on adherence to law is better than lawlessness, but that is not saying much. What law cannot do that expert rulers can and must is judge the *kairos*: discern the right and the wrong ’moment’ to undertake a great enterprise of state. This proposition follows from the second of Plato’s key claims, which is represented as one true of all practical arts: real expertise consists not of measuring larger and smaller, but in determining the norm between excess and defect - a notion which we ordinarily think more Aristotelian than Platonic (see Aristotle §22), although it recurs in a different guise in *Philebus*. Finally, Plato thinks we shall only get our thinking straight on this as on any matter if we find the right - usually homely - model. *Statesman* makes the statesman a sort of weaver. There are two strands to the analogy. First, like weaving statesmanship calls upon many subordinate skills. Its job is not to be doing things itself, but to control all the subordinate functions of government, and by its concern for the laws and every other aspect of the city weave all together. Second, the opposing temperaments of the citizens are what most need weaving together if civil strife is to be avoided, and (as in *Republic*) expert rulers will use education and eugenics to that end.

Statesman shares themes with both *Philebus* and *Laws*. *Philebus* is the one late dialogue in which Socrates is principal speaker, as befits its ethical topic: the question whether pleasure or understanding is the good, or at least the more important ingredient in the good life. After so much insistence in middle-period dialogues on the Form as a unity distinct from the plurality of the phenomena, it comes as a shock to find Socrates stressing at the outset that there is no merit in reiterating that pleasure or understanding is a unity. The skill resides in being able to determine what and how many forms of understanding and pleasure there are. What *Philebus* goes on to offer next is a model for thinking about how any complex structure is produced, whether a piece of music or the universe itself. It requires an intelligent cause creating a mixture by imposing limit and proportion on something indeterminate. This requirement already indicates the main lines of the answer to our problem, at any rate, if it is accepted that pleasure is intrinsically indeterminate. Clearly intelligence and understanding will be shaping forces in the good life, but pleasures are only admissible if suitably controlled. At the adjudication at the end of the dialogue, this is just the result we get. The majority of the many forms of pleasure defined and examined in the course of the dialogue are rejected. They do not satisfy the criteria of measure and proportion which are the marks of the good.

17 *Laws*

The vast *Laws* is in its way the most extraordinary of all Plato’s later writings, not for its inspiration (which flags) but for its evidence of tireless fascination with things political. Its relation to *Republic* and *Statesman* has been much debated. What is clear is that Plato is legislating - through the last eight of its twelve long books - for a second best to the ideal state and ideal statesman of *Republic*, with greater zeal than *Statesman* might have led one to expect. Is this because he has lost faith in those ideals, which still seemed alive in *Statesman* at least as ideals?

That view is in danger of overlooking *Republic*'s own indication that it would be wrong to expect in practice anything but an approximation of the ideal.

Philosophers do not often read *Laws*. But book X presents Plato's natural theology, as the background to laws dealing with atheists. And perhaps the most interesting proposal in the dialogue concerns the very idea of legislation. It is the notion of a 'prelude' to a law, which is the attempt the legislator should make to *persuade* citizens of the necessity of the prescriptions of the law itself. Here is a theme which relates interestingly to conceptions of reason, necessity and persuasion found in several other dialogues, notably *Republic* and *Timaeus*.

18 Plato's influence

Plato's influence pervades much of subsequent Western literature and thought. Aristotle was among those who came to listen to him in the 'school' he founded in the Academy; and a great deal of Aristotle's work is conceived in explicit or implicit response to Plato. Other philosophical traditions flourished after Aristotle's time in the last centuries BC, and the Academy of the period read Plato through sceptical spectacles (see Arcesilaus). But from the first century AD onwards Platonism in various forms, often syncretistic, became the dominant philosophy of the Roman Empire (see Platonism, Early and Middle), especially with the rise of Neoplatonism in late antiquity (see Neoplatonism). Some of the Fathers of the early Greek Church articulated their theologies in Platonist terms; and through Augustine in particular Plato shaped, for example, the Western Church's conception of time and eternity (see Patristic philosophy). A Neoplatonist version of him prevailed among the Arabs (see Platonism in Islamic philosophy).

With the translation of Plato into Latin in the high Middle Ages (see Platonism, medieval) and the revival of Greek studies in the Renaissance, Platonism (again in a Neoplatonic guise) once more gripped the minds of learned thinkers in the West, for example at the Medici court in fifteenth century Florence (see Platonism, Renaissance). But none of the great philosophers of the modern era has been a Platonist, even if Plato was an important presence in the thought of a Leibniz or a Hegel or a Russell. Probably he has never been studied more intensively than in the late twentieth century. Thanks to the availability of cheap translations in every major language and to his position as the first great philosopher in the Western canon, he figures in most introductory courses offered every year to tens of thousands of students throughout the developed world.

MALCOLM SCHOFIELD

List of works

Plato (390s-347 BC) *Platonis Opera*, ed. J. Burnet, Oxford: Clarendon Press, 1900-7, 5 vols.(The classic Oxford Classical Texts edition of the Greek text of all Plato's works, including those frequently regarded as spurious or dubious; follows the Thrasyllan organization of the corpus adopted in the manuscript tradition.)

Plato (390s-347 BC) *Platonis Opera*, vol. 1, *Euthyphro, Apologia Socratis, Crito, Phaedo, Cratylus, Theaetetus, Sophistes, Politicus*, ed. E.A. Duke, W.F. Hicken, W.S.M. Nicoll, D.B. Robinson and J.C.G. Strachan, Oxford: Clarendon Press, 1995.(The first volume of a new Oxford Classical Text, designed to replace Burnet's 1900-7 edition.)

Plato (390s-347 BC) *The Collected Dialogues of Plato including the Letters*, ed. E. Hamilton and H. Cairns, Princeton, NJ: Princeton University Press, 1961.(Useful one-volume collection of translations by various hands; excludes a few of the dialogues generally regarded as spurious.)

Plato (390s-347 BC) *Plato: Complete Works*, ed. J.M. Cooper, Indianapolis, IN: Hackett, 1997.(The most complete one-volume collection, with translations by various hands; includes *Spuria* and *Dubia*, introductions and bibliography; many dialogues are also available separately in paperback editions.) Any chronological order for Plato's writings is speculative. That given below reflects the view of Plato taken in this entry. The list includes all the works generally agreed to be authentic, and one or two that may be inauthentic.

Plato (*c*.395-387 BC) *Ion*, trans. and ed. T.J. Saunders, in *Plato: Early Socratic Dialogues*, Harmondsworth: Penguin, 1987.(Includes bibliography.)

Plato (*c*.395-387 BC) *Hippias Minor*, trans. R. Waterfield, in T.J. Saunders (ed.) *Plato: Early Socratic Dialogues*, Harmondsworth: Penguin, 1987.(Includes bibliography.)

Plato (*c*.395-387 BC) *Crito*, ed. J. Burnet, in *Plato's Euthyphro, Apology of Socrates, and Crito*, Oxford: Clarendon Press, 1924; trans. R.E. Allen, *Socrates and Legal Obligation*, Minneapolis, MN: University of Minnesota Press, 1970.(The former contains notes on the Greek text, the latter notes and essays.)

Plato (*c*.395-387 BC) *Apology*, ed. J. Burnet, in *Plato's Euthyphro, Apology of Socrates, and Crito*, Oxford:

Clarendon Press, 1924; trans. R.E. Allen, *Socrates and Legal Obligation*, Minneapolis, MN: University of Minnesota Press, 1970.(The former contains notes on the Greek text, the latter notes and essays.)

Plato (*c*.395-387 BC) *Gorgias*, ed. E.R. Dodds, *Plato Gorgias*, Oxford: Clarendon Press, 1959; trans. T.H. Irwin, *Plato: Gorgias*, Oxford: Clarendon Press, 2nd edn, 1995; trans. R. Waterfield, *Plato Gorgias*, Oxford and New York: Oxford University Press, 1994.(A major work of scholarship, Dodds includes introduction, summaries and full commentary on the Greek text; Irwin and Waterfield include bibliographies.)

Plato (*c*.386-380 BC) *Menexenus*, trans. and ed. R.G. Bury, in *Plato: Timaeus, Critias, Cleitophon, Menexenus, Epistles*, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1929. (Greek text with facing English translation.)

Plato (*c*.386-380 BC) *Euthyphro*, ed. J. Burnet, in *Plato's Euthyphro, Apology of Socrates, and Crito*, Oxford: Clarendon Press, 1924; trans. R.E. Allen, *Plato's 'Euthyphro' and the Earlier Theory of Forms*, London: Routledge & Kegan Paul, 1970.(The former contains notes on the Greek text, the latter commentary and essays.)

Plato (*c*.386-380 BC) *Laches*, trans. I. Lane, in T.J. Saunders (ed.) *Plato: Early Socratic Dialogues*, Harmondsworth: Penguin, 1987.(Includes bibliography.)

Plato (*c*.386-380 BC) *Charmides*, trans. D. Watt, in T.J. Saunders (ed.) *Plato: Early Socratic Dialogues*, Harmondsworth: Penguin, 1987.(Includes bibliography.)

Plato (*c*.386-380 BC) *Protagoras*, trans. B. Jowett, revised M. Ostwald, *Plato Protagoras*, Indianapolis, IN: Bobbs-Merrill, 1956; trans. C.C.W. Taylor, *Plato: Protagoras*, Oxford: Clarendon Press, 2nd edn, 1991. (Ostwald includes a classic essay by G. Vlastos as introduction; Taylor includes notes and bibliography.)

Plato (*c*.386-380 BC) *Meno*, ed. R.S. Bluck, *Plato's Meno*, Cambridge: Cambridge University Press; ed. and trans. R.W. Sharples, *Plato: Meno*, Warminster: Aris & Phillips, 1985; trans. J.M. Day, *Plato's Meno in Focus*, London and New York: Routledge, 1994.(Bluck includes introduction and commentary on the Greek text; Sharples includes notes and bibliography; Day has both introduction and bibliography as well as essays by various hands.)

Plato (*c*.386-380 BC) *Symposium*, ed. R.G. Bury, *The Symposium of Plato*, Cambridge: Cambridge University Press, 2nd edn, 1932; ed. K.J. Dover, *Plato: Symposium*, Cambridge: Cambridge University Press, 1980; trans. A. Nehamas and P. Woodruff, *Plato: Symposium*, Indianapolis, IN: Hackett, 1989; trans. R. Waterfield, *Plato Symposium*, Oxford and New York: Oxford University Press, 1994. (Both Bury and Dover include introductions and notes on the Greek text; also Nehamas and Woodruff, and Waterfield, include introduction and bibliography.)

Plato (*c*.386-380 BC) *Phaedo*, ed. C.J. Rowe, *Plato: Phaedo*, Cambridge: Cambridge University Press, 1995; trans. R. Hackforth, *Plato's Phaedo*, Cambridge: Cambridge University Press, 1955; trans. D. Gallop, *Plato Phaedo*, Oxford and New York: Oxford University Press, 1993. (Rowe includes introduction, notes on the Greek text and bibliography; Hackforth offers commentary; Gallop includes notes and bibliography.)

Plato (*c*.380-367 BC) *Hippias Major*, ed. D. Tarrant, *The Hippias Major attributed to Plato*, Cambridge: Cambridge University Press, 1928; trans. P. Woodruff, *Plato: Hippias Major*, Oxford: Blackwell, 1982.(The former offers Greek text with introduction and commentary; the latter includes introduction, essays and bibliography.)

Plato (*c*.380-367 BC) *Republic*, ed. J. Adam, revised. D.A. Rees, *The Republic of Plato*, Cambridge: Cambridge University Press, 1963, 2 vols; trans. P. Shorey, *Plato: Republic*, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1930, 2 vols; trans. A.D. Lindsay, revised T.H. Irwin, *Plato: Republic*, London: Dent, 1992.(Adam includes Greek text with notes; the Loeb edition has Greek text with facing English version; Lindsay includes introduction and bibliography.)

Plato (*c*.380-367 BC) *Cratylus*, ed. L. Méridier, *Platon: Cratyle*, Budé series, Paris: Les Belles Lettres, 3rd edn, 1961; trans. H.N. Fowler, in *Plato: Cratylus, Parmenides, Greater Hippias, Lesser Hippias*, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1926.(Méridier offers Greek text with facing French translation, introduction and notes; Fowler has Greek text with facing English translation.)

Plato (*c*.380-367 BC) *Euthydemus*, ed. E.H. Gifford, *The Euthydemus of Plato*, Oxford: Clarendon Press, 1905; trans. R.K. Sprague, *Plato, Euthydemus*, Indianapolis, IN: Bobbs-Merrill, 1985; trans. R. Waterfield, in T.J. Saunders (ed.) *Plato: Early Socratic Dialogues*, Harmondsworth: Penguin, 1987.(Gifford includes Greek text with notes; Sprague and Waterfield both include bibliographies.)

Plato (*c*.380-367 BC) *Lysis*, trans. D. Bolotin, *Plato's Dialogue on Friendship*, Ithaca, NY: Cornell University Press, 1979; trans. D. Watt, in T.J. Saunders (ed.) *Plato: Early Socratic Dialogues*, Harmondsworth: Penguin, 1987.(Both include bibliographies.)

Plato (*c*.380-367 BC) *Parmenides*, trans. F.M. Cornford, *Plato and Parmenides*, London: Routledge & Kegan Paul,

1939; trans. M.L. Gill and P. Ryan, *Plato: Parmenides*, Indianapolis, IN: Hackett, 1996.(Cornford supplies a running commentary; Gill and Ryan include substantial introductory essay and bibliography.)

Plato (*c*.380-367 BC) *Theaetetus*, ed. L. Campbell, *The Theaetetus of Plato*, Oxford: Clarendon Press, 1883; trans. J.H. McDowell, *Plato: Theaetetus*, Oxford: Clarendon Press, 1973; trans. M.J. Levett, revised M. Burnyeat, *The Theaetetus of Plato*, Indianapolis, IN: Hackett, 1990.(Campbell includes Greek text and notes; Burnyeat includes bibliography and book-length introductory essay of classic status.)

Plato (*c*.366-360 BC) *Phaedrus*, ed. and trans. C.J. Rowe, *Plato: Phaedrus*, Warminster: Aris & Phillips, 1986; trans. A. Nehamas and P. Woodruff, *Plato: Phaedrus*, Indianapolis, IN: Hackett, 1995.(Both includes bibliographies; the latter also includes an introduction.)

Plato (*c*.366-360 BC) *Timaeus*, ed. A. Rivaud, *Platon: Timée, Critias*, Budé series, Paris: Les Belles Lettres, 1925; trans. F.M. Cornford, *Plato's Cosmology*, London: Routledge & Kegan Paul, 1937.(The former has Greek text with facing French translation, introduction and notes; the latter includes commentary of classic status.)

Plato (*c*.366-360 BC) *Critias*, ed. C. Gill, *Plato: The Atlantis Story*, Bristol: Bristol Classical Press, 1980; trans. H.D.P. Lee, *Plato: Timaeus and Critias*, Harmondsworth: Penguin, 1971.(Gill includes introduction and commentary.)

Plato (*c*.366-360 BC) *Sophist*, ed. L. Campbell, *The Sophistes and Politicus of Plato*, Oxford: Clarendon, 1867; trans. F.M. Cornford, *Plato's Theory of Knowledge*, London: Routledge & Kegan Paul, 1935; trans. N.P. White, *Plato: The Sophist*, Indianapolis, IN: Hackett, 1993.(Campbell's is the classic edition, especially for the introduction on Plato's late style, and includes notes on the Greek text; White includes introduction and bibliography, Cornford a running commentary.)

Plato (*c*.366-360 BC) *Statesman (Politicus)*, ed. L. Campbell, *The Sophistes and Politicus of Plato*, Oxford: Clarendon Press, 1867; trans. J.B. Skemp, *Plato: The Statesman*, London: Routledge & Kegan Paul, 1952; ed. and trans. C.J. Rowe, *Plato: Statesman*, Warminster: Aris & Phillips, 1995.(Campbell's is the classic edition, especially for the introduction on Plato's late style; Skemp offers a substantial introduction; Rowe includes bibliography and notes.)

Plato (*c*.360-347 BC) *Philebus*, ed. R.G. Bury, *The Philebus of Plato*, Cambridge: Cambridge University Press, 1897; trans. R. Hackforth, *Plato's Examination of Pleasure*, Cambridge: Cambridge University Press, 1945; trans. J.C.B. Gosling, *Plato: Philebus*, Oxford: Clarendon Press, 1975; trans. D. Frede, *Plato: Philebus*, Indianapolis, IN: Hackett, 1993.(Bury offers notes on the Greek text, Hackforth a commentary, Gosling and Frede include substantial introductions and bibliography.)

Plato (*c*.360-347 BC) *Seventh Letter*, ed. R.S. Bluck, *Plato's Seventh and Eighth Letters*, Cambridge: Cambridge University Press, 1947; trans. W. Hamilton, *Plato: Phaedrus and Letters VII and VIII*, Harmondsworth: Penguin, 1973.(Bluck includes Greek text with notes.)

Plato (*c*.360-347 BC) *Laws*, ed. E.B. England, *The Laws of Plato*, Manchester: Manchester University Press, 1921, 2 vols; trans. T.J. Saunders, *Plato: Laws*, Harmondsworth: Penguin, 1970. (England includes Greek text with notes; Saunders includes introduction, summaries and bibliography.)

Platonism in Islamic philosophy

*Plato seems to have been more an icon and an inspiration than an authentic source for Islamic philosophers. So far as is known, the only works available to them in Arabic translation were the Laws, the Sophist, the Timaeus and the Republic. His name was often invoked as a sage and an exemplar of that wisdom available to humankind among the Greeks before the revelation of the Qur'an. This in itself could represent a kind of affront to orthodox Islam, which tended to view the human situation before the Qur'an's 'coming down' as one of pervasive ignorance (*jahaliyya*). However, the rise of humanist culture in Baghdad during the ninth and tenth centuries* AD, *which involved Syriac Christian translators, presupposed a gradual acceptance of Greek wisdom in which Plato figured paradigmatically, even though far fewer of his works were made available in translation than those of Aristotle.*

Plato's influence on Islamic philosophy can be observed most clearly in ethics and political philosophy, given the works available to Islamic thinkers. However, his role lay more in creating an environment hospitable to philosophical reflection than in contributing to the formation of specific philosophical doctrines (where the influence of Aristotle was stronger) (see Aristotelianism in Islamic philosophy). He was referred to as 'the sublime and divine Plato', no doubt because his writings seemed to lead one more directly than any other Greek philosopher to reflect on human actions in the light of transcendent goals. At this level of inspiration, collections of sayings attributed to Plato, notably on the adverse relation of knowledge to wealth and power, helped to set a stage on which philosophy could play a propaedeutic role for Muslims seeking truth as they followed the 'straight path' laid out in the Qur'an. At the same time 'philosophy' so practised could present itself as an encompassing way of life, so competing with observant Islam. Here a discussion inspired by Plato regarding the relative weight of logic and grammar is relevant, since Arabic had tended to legislate semantic conflicts by recourse to grammar, while Greek philosophical texts (themselves originating in another language) extolled logic as a norm for rational discourse, transcending the peculiarities of a single tongue and the grammar proper to it. This potential conflict came to the fore in considering the qualities required for a just ruler of a Muslim polity, specifically regarding the relative merits of 'prophecy' (the generic Islamic term for the deliverances of revelation) and philosophical reason.

The *locus classicus* for such considerations is Plato's *Republic*, which offered an ideal paradigm for a just ruler that was adopted in lieu of Aristotle's more legislative treatment in the *Politics* - the only text of Aristotle's not translated into Arabic. Al-Farabi's treatise on the 'perfect state' (*al-Madina al-fadila (The Virtuous City)*) presents a didactic Neoplatonic version of Plato's *Republic*, one in which 'the Good' is transmuted into 'the First' in such manner that the ordering proper to cosmos and the microcosmic ideal polity emanates from the ever-fruitful One (see al-Farabi §§2, 4). Al-Farabi states unequivocally that philosophical reason outstrips prophecy as a requisite for the wise and just ruler, but the pattern established in his treatise was able to be adapted by those who weighed their relative merits otherwise. What was severely contested, however, was the relevance of Plato's ideal scenario (or its adaptation by al-Farabi) to the actual ruling of an Islamic polity. Rulers themselves took issue with it, speaking from experience, as did intellectuals (such as al-'Amiri) who assimilated Plato's lofty philosophical ideals to Sufi ascetic practices. For such as these, Plato's dictum that philosophers are prevented from attaining wisdom by the mores of the city in which they live spoke more directly to their experience.

Plato's teaching on the human soul as 'an incorporeal substance that moves the body' seemed to offer a philosophical teaching conducive to Islam, even though Ibn Sina's way of adopting this teaching would put 'philosophy' in conflict with Qur'anic faith in resurrection of the body (see Ibn Sina §6; al-Ghazali §3). Ethical thinkers like Ibn Miskawayh adopted Plato's tripartite division of the soul, however, in elaborating an ethical teaching relating Islam to a wider humanist culture, relying on extant sayings which quoted Plato: 'whoever rules his reason is called wise; whoever rules his anger is called courageous; and whoever rules his passion is called temperate.' The influence of sayings of this sort would permit a wise ruler like Ibn al-'Amid to say that he considered himself a 'member of the following [*shi'a*] of Plato, Socrates and Aristotle'. In this manner, Plato contributed an anthropology to Islamic thought which could be used to elaborate the 'straight path' of the Qur'an as well as bring it into contact with a wider humanist civilization.

Platonism, Early and Middle

Platonism is the body of doctrine developed in the school founded by Plato, both before and (especially) after his death in 347 BC*. The first phase, usually known as 'Early Platonism' or the 'Early Academy', ran until the 260s* BC*, and is represented above all by the work of Plato's first three successors, Speusippus, Xenocrates and Polemo. After an interval of nearly two centuries during which the Academy became anti-doctrinal in tendency, doctrinal Platonism re-emerged in the early first century* BC *with Antiochus, whose school the 'Old Academy' claimed to be a revival of authentic Platonism, although its self-presentation was largely in the terminology forged by the Stoics. The phase from Antiochus to Numenius is conventionally known as Middle Platonism, and prepared the ground for the emergence of Neoplatonism in the work of Plotinus. Its leading figures are Antiochus, Eudorus, Plutarch of Chaeronea, Atticus, Alcinous, Albinus, Calvenus Taurus and Numenius. Its influence is also visible in major contemporary thinkers like the Jewish exegete Philo of Alexandria and the doctor Galen.*

Like Neoplatonism, Early and Middle Platonism were founded on a very close reading of the text of Plato, especially the Timaeus*, often facilitated by commentaries, and further supplemented by knowledge of his 'unwritten doctrines'. However, Early and Middle Platonists did not develop nearly so elaborate a metaphysics as the Neoplatonists, and there was a much greater concentration on ethics. Most Middle Platonists regarded Aristotle as an ally, and incorporated significant parts of his thought into Platonism, especially in ethics and logic. Some were Neo-Pythagorean in tendency, and most claimed in some sense to be able to trace Platonic thought back to Pythagoras.*

The Platonists developed the dualism of the One (an active, defining principle) and the Indefinite Dyad (an indeterminate, material principle), bequeathed by Plato, especially through his oral teachings. These eventually emerged as, respectively, God and matter, supplemented by the Platonic Forms, which Middle Platonists typically identified with God's thoughts. The world-soul was distinguished from the demiurge or creator, who was in turn either distinguished from or collapsed into the primary divinity, a supreme intellect. Some, notably Plutarch, postulated in addition a counterbalancing evil world-soul. As regards the human soul, Plato's division of it into a rational plus two irrational parts was maintained, along with his doctrine of transmigration. There was also an increasing focus on the intermediary role played by daemons in the functioning of the world.

*In ethics, most Middle Platonists came to effect an assimilation between Plato's and Aristotle's views. All agreed with Plato and Aristotle, against the Stoics, that as well as moral there are also non-moral goods, such as health and wealth. While there was a consensus that the latter are not necessary for happiness, some, notably Antiochus, defended the view that non-moral goods are indispensable, at least to supreme happiness. In addition, Aristotle's doctrine that virtue lies in a 'mean' became a central feature of Platonist ethics. As for the 'goal' or 'end' (*telos*) of life, this came from the first century* BC *onwards, perhaps starting with Eudorus, to be specified by Platonists as 'likeness to God'. Finally, the issue of determinism was, in the wake of Hellenistic philosophy, recognized as important by Middle Platonists, who defended the existence of free will.*

Platonism never developed its own logic, but adopted Peripatetic logic, including both syllogistic and the theory of categories, both of which, it was claimed, had been anticipated by Plato.

1 Historical outline

Plato was succeeded in the headship of the Academy (see Academy) by his nephew Speusippus, whose most distinctive contributions to Platonism were developments of Plato's 'unwritten doctrines', based on a mathematicizing metaphysics. Speusippus' own successor, Xenocrates, did much more to further the formalization of Plato's thought into a system. He was succeeded in turn by Polemo, whose own contributions were mainly in ethics (see Ariston of Chios §2), although he is said still to have maintained the Platonic system as a whole: Polemo's contemporary Crantor was the first Platonic commentator. Soon after Polemo's death, the Academy became the sceptical 'New Academy', and remained so for nearly two centuries. Only in the early first century BC was a serious attempt made, by Antiochus of Ascalon, to recreate doctrinal Platonism under the title 'Old Academy', although his version was perceived as uncomfortably close to Stoicism. Antiochus, like most Middle Platonists in his wake (the main exceptions being Eudorus and Atticus), regarded Aristotle as himself a Platonist, whose ideas could, with some caution, be incorporated into Platonism.

Antiochus strongly rejected the claim of the sceptical Academics to be true to the Platonic tradition, although some later Platonists, notably Plutarch of Chaeronea, were prepared to accept the contribution of the New Academy to the overall development of Platonism, and to use the arguments of the New Academy (as, indeed, was Antiochus himself on occasion) to combat the Stoics. It was perhaps around this time that a tradition grew up which held that the New Academics had ‘dogmatized in secret’, using scepticism merely as a device for confounding their opponents, particularly the Stoics, and revealing positive Platonic doctrines to trusted disciples after years of initiation. In general, however, the scepticism of the New Academy came to be regarded as an aberration in Platonism.

The Athenian ’Academy’ does not seem to have survived into the later part of the first century BC (we hear of only two other heads, the first of whom was Antiochus’ brother, Aristus). Thereafter there was no central Platonic school, and the centre of activity in Platonism shifted for a while to Alexandria, where we find the shadowy figure of Eudorus propounding a more transcendental, Pythagorean-influenced Platonism. He apparently wrote a commentary on Plato’s *Timaeus*, as well as a critical one on Aristotle’s *Categories*. He also seems to have written on the first principles of the Pythagoreans, expounding his own doctrine in the process. Perhaps close in date to Eudorus is the anonymous commentator on Plato’s *Theaetetus*, part of whose commentary survives on papyrus.

The next known representative of Platonism, in the early first century AD, is the emperor Tiberius’ court philosopher Thrasyllus, who came from Alexandria, and produced what was to become the definitive edition of Plato’s works (see Plato §§2-3). In addition, something can be learnt of contemporary Platonism from the works of the Jewish philosopher Philo of Alexandria. The scene then moves back to Athens, in the latter half of the first century, with Plutarch’s teacher Ammonius, who was prominent in civic life there. Plutarch himself did not continue Ammonius’ school - it is doubtful whether anyone did - but set up a circle of his own in his home town Chaeronea.

Plutarch is an interesting mixture of influences. On the one hand he supported an almost Persian degree of dualism in his interpretation of Plato, which involves, among other things, a literal interpretation of Plato’s creation myth of the *Timaeus*, and belief in an independent, irrational world-soul. On the other he fostered a hospitality to the tradition of the New Academy, which sets him at odds with the tradition of both Antiochus and Eudorus, although this did not make him a sceptic to any serious extent. In ethics, Plutarch inclined to Aristotelian moderation rather than Stoic asceticism.

In the next generation, we find in Athens Calvenus Taurus from Beirut, who ran a school of much the same simple nature as that of Ammonius (although we cannot judge whether he is in a strict sense Ammonius’ successor). Taurus was, like Plutarch, Aristotelian in his ethics, but he did not share Plutarch’s views on the temporal creation of the world. He was perhaps succeeded in Athens by Atticus, who may also be the first incumbent of the Chair of Platonic Philosophy which the emperor Marcus Aurelius (§1) set up in Athens in AD 176. Atticus, however, agreed with Plutarch, against Taurus, on the question of the temporal creation of the world, and showed, in the one (polemical) work of his of which we have any fragments, a strong aversion to the Aristotelian tradition, with a corresponding hospitality to the Stoics. We know of a pupil of his, Harpocration of Argos, who seems, however, also to be influenced by the Neo-Pythagorean tradition emanating from Numenius.

Neo-Pythagoreanism is a significant force in Middle Platonism (see Neo-Pythagoreanism). Although most of its adherents wished to be regarded as a distinct sect, it seems more accurate to regard it as a phenomenon emanating from the Early Academy, and specifically from the tendency of Speusippus and Xenocrates to project their versions of Platonism back onto Pythagoras. Perhaps its most substantial figures are Moderatus of Gades, who repudiated the Platonists and claimed to be restoring the true doctrines of Pythagoras, and Numenius of Apamea (Syria), the ’grandfather’ of much of Neoplatonism, noted for his knowledge of, and hospitality towards, oriental philosophical and religious systems, including Judaism. Plotinus seems more influenced by Numenius than by any other Middle Platonist.

Other influential Platonists of the second century included Gaius and his pupil Albinus, the teacher of Galen. We also have two important handbooks of Platonism of the time: one, the *Didaskalikos* or ’Manual of Platonism’ by Alcinous (whom scholars long wrongly identified with Albinus), the other, *On Plato and his Doctrine*, composed by the distinguished north African rhetorician Apuleius of Madaura. Both are invaluable summaries of Platonic doctrine of the early centuries AD.

2 Plato's legacy

Plato bequeathed to his successors not so much a well-rounded and coherent philosophical system as an immensely fertile and provocative series of problems. Certainly there were distinctive doctrines that one can identify as Platonic - the theory of Forms or the doctrine of the (tri)partition of the soul - but even these, when examined, are seen to be fluid and open-ended. There was also a persistent tradition about 'unwritten doctrines' of Plato's, in particular, the derivation of everything from just two principles, the 'One' and the 'Indefinite Dyad'. Such views are better seen as working hypotheses, to be taken up and developed at will by his successors.

Plato's immediate successors were not obedient disciples, but independent thinkers who, to paraphrase the words of the most independent of them, Aristotle, 'loved Plato, but loved truth more'. Nor, so far as we can see, did Plato demand or encourage unquestioning acceptance of his beliefs. The whole rationale of composing dialogues rather than formal treatises, as well as the process of dialectic, indicates the opposite. It is in fact a profound mystery how Plato presented, or 'published', the dialogues, and what relation they were meant to have to the on-going work of the school. In the case of at least one dialogue, the *Timaeus*, one of the most influential in later times, and in view of the controversy that sprang up immediately after Plato's death as to its correct interpretation, it would seem that the master himself declined to give an authoritative exegesis of it. If, among Plato's own pupils, Aristotle could maintain that Plato taught the temporal creation of the world (*On the Heaven* I 12, II 2) while Speusippus and Xenocrates could deny this, claiming that Plato only presented such a scenario 'for instructional purposes', it cannot be the case that Plato himself made his intentions clear.

If then the dialogues are not the sole repository of Platonic doctrine, what is? There is, in fact, considerable secondary evidence as to the views entertained by Plato on certain basic questions. A good deal of this is preserved only in late authorities, such as the commentators on Aristotle (particularly Alexander and Simplicius) - although such information is sometimes explicitly referred back to contemporaries of Plato, such as Hermodorus. The greatest single source is however Aristotle himself, and Aristotle had been an associate of Plato's for twenty years. It has been claimed that Aristotle's reports of Platonic doctrines not present in Plato's dialogues are based on repeated misunderstandings of the content of the dialogues (Cherniss 1945); this view is too extreme, but we must always remember that Aristotle, although he doubtless knew what he was talking about in each instance, is nearly always giving a polemical and allusive, rather than a scholarly and systematic, account of what he knows. Nevertheless, by looking at his evidence with a properly critical eye, one can deduce a body of doctrine which is, in broad outline at least, coherent and reasonable, and fits in well with the developments attributed to Speusippus and Xenocrates.

3 Early Platonist metaphysics

To begin with first principles, it seems clear that Plato, in his later years at least, had become increasingly attracted by the philosophical possibilities of Pythagoreanism: that is to say, the postulation of a mathematical model for the world (see Pythagoreanism §2). Mathematics seems to have been a discipline much worked on in the Academy, and the insights derived from this (amplified by the researches of his mathematician colleagues such as Eudoxus, Menaechmus and Theaetetus) drove Plato progressively to certain general conclusions. He arrived at a system which involved a pair of opposed first principles, and a triple division of levels of being, the latter doctrine giving a vital central and mediating role to the soul, both world-soul and individual soul. Reflections of these basic doctrines can be seen in such mature dialogues as the *Republic*, *Philebus*, *Timaeus* and *Laws*, but they can not be deduced from the dialogues alone.

As first principles Plato established the One and the Indefinite Dyad. The One is an active principle, imposing 'limit' (*peras*) on the limitlessness (*apeiron*) of the opposite principle. The Dyad is regarded as a sort of duality (also termed by Plato 'the great-and-small'), infinitely extensible or divisible, being simultaneously infinitely large and infinitely small. The influence of the Dyad is to be seen all through nature in the phenomena of continuous magnitudes, and in excess and defect which have continually to be checked by the imposition of the correct measure. This process has an ethical aspect also, since, anticipating a well-known doctrine of Aristotle, the virtues are to be seen as correct measures ('means') between extremes of excess and deficiency on a continuum (see §8).

The Indefinite Dyad is primarily the basic unlimitedness or 'otherness' on which the One acts, but it is also the irrational aspect of the soul, and again the substrate of the physical world, corresponding to Plato's 'receptacle' of

becoming. Plato notoriously does not have a doctrine of ‘matter’ (*hylē*) as such, in the Aristotelian sense, but he does address the question of the nature of such ’substratum’ as there may be to the action of the various active principles in his system, namely God, the Forms and the soul. He addresses this particularly in the *Timaeus*. For him, the ‘receptacle’ (*hypodochē*) or ’place’ (*chōra*), introduces into the Forms, as they are projected forth from the intelligible realm through the mediation of soul, an element of indefinite multiplicity and imperfection which it is beyond the power of God to overcome completely.

By acting upon the Dyad, ’limiting’ it, the One generates the Form-numbers. At this point, however, the evidence becomes confused. It seems that Plato came finally to view the Forms as numbers, or mathematical entities of some sort. A special importance is attached by him, as it was by the Pythagoreans, to the ’primal numbers’, one, two, three and four, and their sum total, ten (the decad). The first four numbers seem to be in some way inherent in the One, and come to actuality in the process of the initial limitation of the Dyad. In *Metaphysics* XIII 7, Aristotle attacks the Platonist doctrine of Form-numbers, which seems to describe a process whereby numbers are generated by, first, the Dyad producing the number two, by doubling the One, and then producing other numbers by adding to two and to each successive number either the One or itself. The whole process remains obscure however, as perhaps it was in Plato’s own mind. From this action of the primal numbers upon the Dyad, and its reaction on them, all other Form-numbers are generated.

These numbers are what the Platonic Forms have become. But how many of them are there? The numbers up to ten certainly hold some sort of distinctively basic position, but the multiplicity of physical phenomena requires that the basic numbers combine with each other in some way to produce compound numbers, which can stand as the formulas for physical phenomena. There must, in fact, be a hierarchy among the Forms. Within the decad, the first four numbers (the *tetraktys*) came to play a major part in Plato’s cosmology, as they did in those of his successors. They are the principles providing the link between the absolute unity of the One and the three-dimensional physical multiplicity around us. These four also have a geometrical aspect, although how that is linked to their essential nature is not clear in Plato (in Speusippus’ system, certainly, the geometricals are a separate level of being). None the less, one is also the point, two the line, three the plane and four the solid - the last two being triangle and pyramid respectively. (For early Platonist innovations on this scheme, see Speusippus §2; Xenocrates §2.)

4 Middle Platonist metaphysics

Middle Platonists were always in the position of oscillating between the poles of attraction constituted by Stoicism and Peripateticism (see Stoicism; Peripatetics), although they added to the mixture of these influences a strong commitment to a transcendent supreme principle, and a non-material, intelligible world apart from this one, which stands as a paradigm for it. Provided that one accepted this basic position, a fairly wide range of views on ethical, physical and logical questions was acceptable, there being no central body or institution to prescribe any strict degree of orthodoxy.

By the first century BC Platonism had established a system of three principles: God, matter and the system of Forms. The fact that the Forms were viewed as the contents of God’s mind does not seem to have conflicted with their status as an independent principle, the paradigmatic cause of the world. This was presumably on the ground that the object of God’s thought was also an objective reality, true being.

Throughout the Middle Platonist period, a dominant theme is the nature and activity of the supreme principle, or God. Some later Platonists preserved the opposition of the Old Academy of Monad, or One, and Dyad, although they varied the relationship that they postulated between the two: Antiochus seems simply to have accepted the Stoic pair of an active and a passive principle (the Platonic Forms being subordinated to the Stoic *logos* or cosmic ‘reason’ (see Stoicism §§3, 5; Logos §1), but Eudorus, while re-establishing the Academic and Pythagorean Monad and Dyad, placed above them both a supreme One, possibly drawing some inspiration here from the metaphysical scheme of Plato’s *Philebus*. Plutarch returned to the basic duality, but he and his follower Atticus granted the Dyad rather more independence than would be traditional for Platonism, because of their commitment to a pre-cosmic ’evil’, or disorderly principle. As for the Forms, Plutarch and Atticus saw them as thoughts of God, although Atticus was accused by Porphyry later of maintaining that they are outside the divine intellect, which probably only means that he wished to assert their objective reality.

For Alcinous and Apuleius, God is dominant and matter simply passive, not even attaining to actuality, while the Forms are, once again, God’s thoughts. In the Neo-Pythagoreanism of Numenius, however, a radical dualism seems to be asserting itself, although partially held in check by the influence of mainstream Platonism. Since it was from Numenius more than from any other variety of Platonism that Plotinus derived his inspiration, this tendency to dualism later persisted within his thought.

It is important also to notice the remarkable system propounded by the Neo-Pythagorean Moderatus of Gades at the end of the first century AD, since it seems to anticipate to some extent Plotinus’ system of *hypostases*. According to Porphyry, Moderatus attributed to Plato a system according to which ‘the first One is above being and all essence, while the second One - which is the ‘truly existent’ and the object of intellection - is the Forms; the third, which is the realm of the soul, participates in the One and the Forms, while the lowest nature, that which comes after it, that of the sense-world, does not even participate, but receives order by reflection from those others’. Moderatus sees an appropriate level of matter manifesting itself at each of these levels.

5 Psychology

In early Platonist metaphysics, it may be only at the level of soul that the four basic numbers assume their geometrical aspect. The composition of the soul in the *Timaeus* is certainly intimately bound up with the doctrine of the four dimensions (see §3) and the relations of proportion between them. From the soul, the four dimensions are projected upon matter, in the form of combinations of basic triangles, to form the four elements, fire, air, water and earth. Thus an uncompromisingly mathematical model of the universe is laid down.

The doctrine of the soul is a central feature of Plato’s system, but it is not without its obscurities. The form which the Form-numbers take on in the soul, and the manner in which they are projected upon matter, are problems to which one can find no satisfactory answer in surviving documents. These problems relate primarily to the world-soul, but the individual soul is of the same composition, although its relation to the world-soul is obscured by figurative language in the *Timaeus* (41d). (For one development of Plato’s account, see Xenocrates §2.) In the individual soul, if we may believe Aristotle (*On the Soul* I 2), the four dimensions of point, line, plane and solid correspond to four levels of cognition: intuitive knowledge (*nous*); scientific knowledge (*epistēmē*); opinion (*doxa*); and sense-perception (*aisthēsis*). This fourfold division seems to be alluded to in Plato (*Laws* X, 894a), and the Line simile of the *Republic* (VI, 509d-) may in some ways adumbrate it.

The questions of the survival of the individual soul, and of its periodic reincarnation, are not settled definitively in early Platonism. Plato certainly argues for the immortality of the soul, but does this include the two lower, irrational elements of the soul, its ‘spirited’ and ‘appetitive’ parts? These are called ’mortal’ in the *Timaeus*, but the *Phaedrus* suggests on the contrary that they too might be immortal. Again, is the process of transmigration into animals to be taken seriously, as a passage in the *Phaedrus* (249b) might suggest, or can human souls only pass into other human bodies? These questions were answered variously by later Platonists. The soul is certainly the linch-pin of the universe for Plato, mediating as it does between the intelligible and sensible realms of existence, and containing in itself the elements or principles of both.

Speusippus and Xenocrates are reported to have considered the entire tripartite soul immortal, but no details of their arguments are reported. The most developed Middle Platonist descendant of their view is in chapter 25 of Alcinous’ *Didaskalikos*. The discarnate soul has three parts: the ‘discriminative’ or ‘cognitive’, the ‘impulsive’ or ‘dispositional’, and the ‘appropriative’. These seem to be three irreducible aspects of the soul, when viewed in dissociation from specific bodily organs. Only during incarnation do they become respectively the ‘rational’ (or ‘calculating’), the ‘spirited’ and the ‘appetitive’ parts, harnessed to the requirements of incarnate life.

6 Theology

Part of the process of tidying up loose ends in Plato’s thought which seems to have taken place in the Early Academy involved distinguishing between the Good of the *Republic* (and perhaps the ‘Monad’ from the ‘unwritten doctrines’) and the creator or ‘demiurge’ of the *Timaeus*. The latter could not straightforwardly be regarded as a supreme deity, since he turns to another entity, the paradigm, or ’essential living being’, which is not of his making. There are thus the conditions here for a distinction between a primary and secondary God, the first totally transcendent, and no more than the ultimate condition of all being (in something of the same way as

Aristotle's 'unmoved mover'), the second an active creator.

How this matter was handled in the Early Academic period is less than clear, however. Both Speusippus and Xenocrates recognized hierarchies of being, but they do not seem to have made this particular contrast. Middle Platonism does come to recognize besides the first principles two intermediate and mediating entities which are to some extent in competition with one another: namely, the demiurge and the world-soul. If the *Timaeus* was not taken as literally creationist, the demiurge could properly disappear, and blend into the supreme divine intellect, becoming its active, causative aspect. This is the path followed in Philo of Alexandria's *On the Creation of the World* and Alcinous' *Didaskalikos* (ch. 10). For others, however, the demiurge comes to be seen as a subordinate God, sometimes, as by Atticus (fr. 8), assimilated to the Stoic *logos*, but sometimes, as by Numenius (frs 15 and 16), presented as a distinct creator-God, subordinate to a supreme, static, self-contemplating entity, derived from the Good of the *Republic*. As for the world-soul, it starts out as the entity whose creation by the demiurge is described in the *Timaeus*, but traces appear, in such thinkers as Philo and Plutarch, of a rather more august figure, which almost seems to reflect the Speusippean principle of multiplicity, a figure not positively evil, but simply responsible for multiplicity, and thus for all creation. In Philo this figure appears as *sophia*, or God's 'wisdom', an entity interchangeable with the Dyad. Elsewhere, as in Alcinous' *Didaskalikos* (chaps 10 and 14) and in Plutarch's *On the Creation of Soul in the Timaeus*, the world-soul is depicted as an irrational entity, requiring 'awakening' by God, who is the demiurgic intellect.

7 Daemons

The question of daemons, or intermediate beings, is something which Plato leaves vague, but was of considerable importance for his successors. Plato's chief exposition of the role of daemons occurs in *Symposium* (202e), where they are presented as messengers or intermediaries between gods and humans, hence themselves less than perfectly divine. Daemons of similar status occur in the myth in Plato's *Statesman*, assisting the god in his administration of the world (271d-e), and the so-called 'young gods' of the *Timaeus* (who are at least partially to be identified with the planetary and star-gods) perform similar tasks for the demiurge.

In time two theories emerged on the nature of daemons, one 'static', the other 'dynamic'. Both these theories recognize a place for 'evil' daemons, either as retributive agents of God, or as souls undergoing punishment in the universe who are filled with malice towards human beings. Xenocrates is the earliest Platonist who seems to have developed a theory of daemons: he held the ‘static’ view - which he expressed in geometrical terms - that they are a distinct and permanent level of being. His daemons sound like permanent fixtures in the universe, although the question of their relationship with disembodied souls is unclear in the evidence available to us. The later, alternative theory, represented by such figures as Plutarch and Apuleius, is a ‘dynamic’ one according to which daemons are in fact souls, on their way either up or down the scale of being towards complete purification, and thus divinization, in the sun, or conversely towards renewed embodiment on the earth (see Plutarch of Chaeronea §5).

The Middle Platonist cosmos was in fact filled with subordinate, intermediate beings, chiefly daemons, but also in later times with such entities as heroes and angels. Heroes and angels, the latter possibly non-Hellenic in origin (they are found in the Chaldaean Oracles, frs 137-8; see Chaldaean Oracles), were certainly accepted by Neoplatonic times into the Platonic universe. Heroes are more respectable, but the distinction between them and daemons in the Middle Platonic period is not quite clear. The Stoic Posidonius wrote a treatise *On Heroes and Daemons*, but it is lost. One distinction might be that heroes are souls formerly embodied, but this distinction assumes a permanent class of unembodied souls, which is only acceptable on the 'static' theory. Whatever the differences in detail, however, it is common ground for all Platonists that between God and humans there must be a host of intermediaries, in order that God may not be contaminated or disturbed by too close an involvement with matter.

8 Ethics

Many of the main concerns of later Platonist ethics already appeared in the Early Academy. Definitions of happiness were produced by Speusippus, Xenocrates and Polemo. Polemo's formula, 'life in accordance with nature', made him an important forerunner of Stoicism (see Stoicism §17). At the very beginning of the Middle Platonist era, Polemo's definition of happiness, now identified formally as the ‘end’ or ‘goal’ (*telos*) of life, was

revived by Antiochus. When we turn to Alexandrian Platonism, however, in the person of Eudorus, we find that the Antiochian definition, influenced as it is by Stoic thought, had been abandoned in favour of a more spiritual, perhaps more truly Platonic, ideal of 'likeness of God' (*homoiōsis theōi*), derived from a famous passage of Plato's *Theaetetus* (176b), and from the *Timaeus* (90a-d). This formula remained the distinctive Platonic definition of the *telos* ever afterward.

A second key issue was whether virtue is sufficient for happiness. Polemo championed the view that, although virtue is sufficient for happiness, there are also non-moral goods. This goes back to Plato, and especially to his distinction in *Laws* I, 631b-c, between higher, or 'divine' goods - that is, goods of the soul, the virtues - and lower or 'human' goods - that is, goods of the body such as health or beauty, and external goods such as good fame or wealth. This passage was constantly cited in later Platonist debate. By Antiochus' time the battle lines had already been clearly drawn between the Peripatetics and the Stoics, and Platonists had to make their choice. Antiochus, although Stoicizing in so much else, sided here with the Peripatetics and the Early Academy in declaring that for complete happiness all three classes of good were required in some measure: goods of the body and external goods as well as the virtues. In this he was opposed by Eudorus, who sided with the Stoics, declaring that the two inferior classes of good could not count as an integral part of happiness, or the *telos*. This was not the end of the argument however. All through the period the two alternatives secured adherents: Plutarch and Taurus agreed with Antiochus and the Peripatos, Alcinous and Atticus with the Stoa.

A frequent further feature of Middle Platonist ethics, well represented in Apuleius and Alcinous, is the incorporation of the Aristotelian definition of virtue as based on a 'mean' (see Aristotle §22). There are in fact sufficient indications that Plato (see especially *Statesman* 283e-285b) had regarded the virtues as intermediate states between the two extremes of 'too much' and 'too little', with justice (symbolized by the Pythagorean *tetraktys* (see §3)) as the force holding the universe together - a metaphysical concept as well as an ethical one.

A question with considerable consequences for ethics, although it was seen rather as a part of physics, is that of free will and necessity, with which is intertwined that of God's providence. Before Epicurus and the Stoics (Chrysippus in particular) had stated the problem of determinism in its starkest form (see Epicureanism §12; Stoicism §§20-1), the question had not, it seems, been one of great urgency. Plato presents it only in mythical form (*Republic* X, especially 617d-619a, *Phaedrus*), but he does, like Aristotle (§20), maintain a belief in personal freedom of choice. Aristotle treats the suggestion that there is no such thing as freedom of choice as a mere sophistic paradox (*Nicomachean Ethics* III). Xenocrates did write an essay on fate (*heimarmenē*), but its contents are unknown. For the Middle Platonists, the problem of free will and necessity could not be dismissed so easily, and they found little help in Plato or Aristotle, although they did make appeal to key passages of both. Philo of Alexandria, in his *On Providence*, gives us the first defence of the Platonist position, which asserts both freedom of the will and the existence of providence with more vigour than logical force. Plutarch also touches on the theme repeatedly, although his most serious discussions of the subject have not survived: the essay *On Fate* surviving under his name is certainly not by him, though it is of great interest for Middle Platonic theory. Alcinous and Apuleius both contribute short discussions of the topic. In general, however, the Middle Platonists, while producing many scholastic formulations, fail to solve the problem, and bequeathed it in all its complexity to Plotinus.

9 Logic

In the area of logic, we must distinguish between what we can discern of genuinely Early Academic logic and what ultimately became accepted in the Platonic school, the latter being nothing less than Aristotelian logic in its entirety and including developments by Aristotle's pupils Theophrastus and Eudemus. The evidence points to Plato's having bequeathed to the Academy the system of division (*diairesis*), as first outlined in the *Phaedrus* (265d-), a system which acquired also a cosmogonic aspect. It is the soul's business to bring order out of chaos by making the right 'divisions', hitting the right means and harmonies. There is no evidence that Plato himself developed anything as elaborate as the Aristotelian syllogistic and system of categories, although Aristotle's 'ten categories' could be seen as little more than an elaboration of the two basic categories of 'absolute' (that is, substance) and 'relative' adopted by the Early Academy. Plato himself seems to have distinguished the basic categories of 'absolute' (*kath' hauto*) and 'other-relative' (*pros hetera*), the latter subdivided into 'opposite-relative' (*pros enantia*) and 'relative' proper (*pros ti*), which in its turn was divided into 'definite' and

'indefinite'. This much was reported by Plato's own pupil Hermodorus (quoted by Simplicius, *On Aristotle's Physics* 247.30-; Hermodorus, fr. 7), undoubtedly representing the practice of the Academy in his day, not the evidence of the dialogues.

In the field of logic, the primary achievement of the Middle Platonic period was to appropriate Aristotelian logic, together with the developments attributable to Theophrastus and Eudemus, for Platonism. Theophrastus and Eudemus had developed the system of hypothetical syllogisms which had been more or less ignored by Aristotle. They distinguished between 'pure' and 'mixed' hypotheticals, the latter being those adopted later by the Stoics (although the Stoics seem to have been the first to develop a logic of propositions rather than terms) (see Logic, ancient). In so far, then, as the Middle Platonists borrowed from Stoic logic (which they also did), they doubtless felt justified in this by finding it largely prefigured in Theophrastus. We find this synthesis exhibited in Alcinous' *Didaskalikos* (ch. 6), as well as in Apuleius' *De interpretatione* and Galen's *Introduction to Logic*. In the *Didaskalikos*, both categorical and hypothetical syllogisms are discerned in Plato's dialogues, particularly *Parmenides*. Plato is further credited there with knowledge of the ten Aristotelian categories, which Alcinous discerns once again in the *Parmenides*, while Plutarch (*On the Creation of Soul* 1023e) sees them operating in *Timaeus* (37a-b). The anonymous commentator on Plato's *Theaetetus*, who finds the categories in the *Theaetetus*, also makes extensive use of Aristotle's *Topics* as a handbook for the analysis of Platonic arguments.

Along with this tendency towards synthesis, however, there existed a tradition within the anti- Aristotelian wing of Platonism (Eudorus, Lucius, Nicostratus and Atticus), criticizing Aristotle's *Categories* (although not, it seems, the rest of his syllogistic). The anti-Aristotelians challenged Aristotle's originality (he was accused of stealing the idea of the ten categories from the Pythagorean Archytas), his completeness and the validity of some of his distinctions. Also, taking him to be making a division of reality rather than of language, they asserted that his distinctions were suitable to the sensible world but not to the intelligible.

Despite all this activity, it cannot be said that the Middle Platonists added much that is valuable to the science of logic. There are a few lost works of Plutarch, such as *A Reply to Chrysippus on the First Consequent*, *A Lecture on the Ten Categories*, *A Discourse on Hypothesis*, and *On Tautology*, which sound interesting, but there is little reason to suppose, on the basis of Plutarch's surviving works, that they contributed much of basic importance (see further Plutarch of Chaeronea §6).

Platonism, medieval

Medieval Platonism includes the medieval biographical tradition, the transmission of the dialogues, a general outlook spanning commitment to extramental ideas, intellectualism in cognition, emphasis on self-knowledge as the source of philosophizing, and employment of the dialogue form. Platonism permeated the philosophy of the Church Fathers, the writings of Anselm and Abelard, the twelfth-century renaissance, the Italian Renaissance and the northern renaissance. Indeed the mathematical treatment of nature, which inspired the birth of modern science in the works of Kepler and Galileo, stems in part from late medieval Pythagorean Platonism.

*The term 'Platonism' is of seventeenth-century origin. Medieval authors spoke not of Platonism but rather of Plato and of Platonists (*platonici*), applying the term 'Platonist' to an extreme extramental realism about universals, or a commitment to the extramental existence of the Ideas. Thus John of Salisbury characterized Bernard of Chartres as 'the foremost Platonist of our time' in regard to his theory of ideas. For Aquinas, Platonists hold an overly intellectualist account of human knowledge, ignoring the mediation of the senses. In general, medieval writers agreed with Cassiodorus' maxim,* Plato theologus, Aristoteles logicus. *Plato was primarily a theologian, an expert on the divine, eternal, immaterial and intelligible realm, a classifier of the orders of angelic and demonic beings, whereas Aristotle was primarily a logician and classifier of the forms of argument.*

Medieval Platonism combines elements drawn from Middle Platonism and Neoplatonism. It generally assumes a dualistic opposition of the divine and temporal worlds, with the sensible world patterned on unchanging immaterial forms, often expressed as numbers. It also affirms the soul's immortality and direct knowledge of intelligible truths, combined with a suspicion of the mortal body and a distrust of the evidence of the senses. Neoplatonists sympathized with Porphyry's aim (in his lost De harmonia Platonis et Aristotelis) of harmonizing Plato with Aristotle. A Platonic outlook (largely inspired by the Timaeus) dominates the early Middle Ages from the sixth to twelfth centuries, whereas the thirteenth and fourteenth centuries, the age of scholasticism, witnessed an explosion in the knowledge of Aristotelian texts, often transmitted through Arabic intermediaries. The new interest in Aristotle was such that, although the Timaeus was widely lectured on during the twelfth and early thirteenth centuries, by 1255 it was no longer required reading at the University of Paris. Interest in Plato re-emerged in the Italian Renaissance with the availability of genuine works of Plato, Plotinus and Proclus. Nevertheless, through Pseudo-Dionysius in particular, Platonism reverberates in many thirteenth-century authors, especially in theology.

1 Platonism and Christianity

Platonism's medieval popularity is related to its overall religious outlook. The early Christian Fathers, especially Clement of Alexandria, Origen, Gregory of Nyssa, Basil, Ambrose and Augustine, regarded Platonism as closer to Christianity than other ancient pagan philosophies, and readily grasped it as the vehicle for articulating the Christian message (see Patristic philosophy). Plato was praised for anticipating Christianity by recognizing the existence of a unique, transcendent, benevolent deity who freely created the world. Plato also taught the doctrine of a created immortal, rational human soul, made in the image of God (*Theaetetus* 176b), and even prescribed a way of salvation. Plato was also an expert on the nature of the divine intelligences. Eriugena, for example, thought of Plato as one who taught the nature of the world soul and of angels (*Periphyseon* III.732d). Indeed some, such as Peter Abelard and John of Salisbury, even discovered hints of the Trinity in Plato (Abelard, *Theologia Christiana* I.68; John of Salisbury, *Policraticus* VII.5).

Augustine's Platonism was hugely influential on medieval philosophy, and Book VIII of his *De civitate Dei (City of God)* is a convenient source book of ancient philosophical ideas. Augustine portrays Platonism as a systematic philosophy focused on unity, truth and goodness. In his early *De vera religione (On True Religion)*, Augustine claimed one need only change a few words to see how closely Plato resembled Christianity (*De vera religione* IV.7), and in *De civitate Dei*, Plato is portrayed as the philosopher closest to Christianity; for example, Plato had defined philosophy as the love of God (VIII.11). According to the *Confessiones*, Augustine's conversion to Christianity had been influenced by his reading 'books of the Platonists' (*libri platonicorum*), most likely Marius Victorinus' translations of Plotinus and Porphyry. These texts convinced Augustine that truth was incorporeal and that God was eternal, unchanging and the cause of all things, parallelling truths revealed in St Paul's epistles.

Augustine was deeply influenced by the Christian Neoplatonism of Victorinus: *Confessiones* VII.11 reproduces Victorinus' doctrine of the various levels of reality (see Marius Victorinus). Also according to Augustine, Plato's understanding of God as true being mirrored the Biblical definition of God as 'I Am Who Am' (Exodus 3:14).

Among the most important Augustinian texts for medieval readers were the *De genesi ad litteram (Literal Commentary on Genesis)* and *De doctrina Christiana (On Christian Doctrine)* which provided the medieval world with a semiotics and scriptural hermeneutics, influencing Cassiodorus, Rhabanus Maurus, Hugh of St Victor, Peter Lombard, Bonaventure, Grosseteste and Erasmus. *De doctrina Christiana* offered a formidable scriptural justification for Christian appropriation of pagan thought: just as the Jews fleeing captivity had borne off the spoils of the Egyptians, so too the Christians could make use of the pagan heritage to teach morality and religion. The work reiterates Ambrose's claim that Plato's wisdom came directly from the Prophet Jeremiah. Augustine later recognized that Plato lived about a century after Jeremiah, but he continued to entertain the notion that Plato could have learned about the Bible from contact with holy men in Egypt, and medieval philosophers, including Abelard and Ficino, carried on this tradition. However, the Christian Fathers often suspected Plato because of his commitment to the soul's pre-existence and transmigration, his polytheism and his silence on the incarnation (interpreted as an innocent ignorance by Petrarch and Ficino).

Platonism persisted in theological discussions on the nature of the divinity. Neoplatonic writers from Eriugena to Nicholas of Cusa thought of God as both beyond being (*superessentialis*) and yet the form of all created beings (*forma omnium*). Eriugena calls God the 'form of forms' (*forma formarum*); for Thierry of Chartres, God is 'the form of being' (*forma essendi*). Following the condemnations of Amaury of Bène and David of Dinant in 1210, neo-Aristotelian philosophers criticized these formulations as leading to pantheism. Thus Aquinas developed his distinction between the divine being and the individual being of each thing. However, both Meister Eckhart and Nicholas of Cusa later reapplied the formula *forma omnium* to God.

Aside from theology and cosmology, Platonism was evident in medieval epistemology, ethics and social and political thought. The Platonic emphasis on certain knowledge over opinion, on intellectual knowledge as opposed to the unreliable offerings of the senses, entered into the Middle Ages through Augustine. The Platonic doctrine of recollection continued in the Augustinian form of illuminationism (for example, in Bonaventure), whereby the mind is said to know by being illuminated from within (either by a natural or a divine light or by a combination of both) (see Augustinianism). Plotinus' identification of evil with privation and non-being was repeated by Augustine and Aquinas. In the medieval period, Platonism in mathematics, the view that mathematical entities (such as numbers and classes) exist separately in their own right, took the form of a defence of the reality of universals as real things (*res*) against the nominalist position that universals were merely words (*voces*) (see Buridan, J.; Universals).

2 The sources of medieval Platonism

Until the fifteenth century, the only Platonic texts available in the Latin west were part of the *Timaeus* (17a-53b) and, from the mid-twelfth century, the *Meno* and *Phaedo*. Medieval Platonism was largely indirect, filtered through the writings of the Christian Fathers, especially Augustine. Gregory of Nyssa's Platonism influenced Eriugena. Aspects of Platonism (for example, the theory of ideas) were also transmitted through Latin writers including Cicero, Seneca, Martianus Capella, Aulus Gellius, Macrobius, Boethius, Cassiodorus and Isidore (see Encyclopedists, medieval). Medieval discussions of Platonic ideas were based not on Platonic dialogues (for example, Aquinas shows no evidence of having read the *Meno*), but primarily on Augustine's discussion of ideas in his *De diversis quaestionibus LXXXIII (On Eighty-Three Different Questions)*, Question 46, which itself drew on Cicero's *Academics* I.19. For Augustine, the Platonic Ideas (*ideae*) were really divine paradigms in the mind of God. Augustine distinguished the divine ideas from the *logoi* or *rationes* of things, created forms which guaranteed the continuity of the species through time, a version of the Stoic seminal reasons discussed chiefly in his *De genesi ad litteram*. Similarly, medieval people learned of Platonic arguments for the immortality of the soul from Cicero's *Tusculan Disputations*.

The *Timaeus* was the only Platonic dialogue widely circulating through the whole medieval period, available in the fourth-century Latin translation of Calcidius. Cicero's earlier translation (*De universo*) was almost unknown in the early Middle Ages (although Augustine expressly cites it in *De civitate Dei* XIII.16). Also in wide circulation in the Middle Ages was Calcidius' extensive, eclectic *Commentary on the Timaeus*, mingling elements of Middle

Platonism (inspired by Numenius) and Porphyrian Neoplatonism. It popularized a Middle Platonist view of Plato for the Middle Ages, in which the cosmos is constructed from three principles: God (*deus*), form (*exemplum*) and matter (*silva*). The first principle, God, is the Supreme Good, cause of all and end of all, beyond substance and nature and above all intellect. God is also characterized as free will and as providence. The second principle is matter, understood as neither sensible nor intelligible, lacking all form. The divine mind informs matter as soul vivifies body. The third principle is form, the intelligible world of the Ideas, understood as God's thoughts. The world soul, understood as made by God, is a kind of second mind. Calcidius was frequently glossed in the twelfth century in particular; of interest to medieval writers was his discussion of the four elements and his number speculation. Interest in numbers was justified by Scripture, and buttressed by Augustine in *De musica* and by Boethius' *De arithmetica*, and by other texts that communicated Pythagorean Platonism to the West (for example, Martianus Capella's *De nuptiis Philologiae et Mercurii (The Marriage of Philology and Mercury))*. Calcidius' *Commentary* includes references to the argument in *Phaedrus* that the soul is self-moving, the comparison in *Theaetetus* of the mind with a wax tablet and the *Republic*'s comparison of the Form of the Good with the sun.

Macrobius' *Commentarius in somnium Scipionis (Commentary on the Dream of Scipio)* was another influential source of Porphyrian Neoplatonism, especially important for twelfth-century philosophers such as William of Conches. Macrobius focuses on the final section of Cicero's *On the Republic*, his version of Plato's *Republic*, which is known as 'Scipio's Dream' (*somnium Scipionis*). Here a dream is recounted which is reminiscent of the Myth of Er, providing an account of the destiny of human souls emphasizing the need to live a life of virtue and hold the body in contempt. Macrobius' allegorical interpretation offers a typically Neoplatonic cosmology including the three hypostases, One, Mind and Soul. The account of the world soul includes a discussion of the nature of the self-mover. Macrobius gives an account of the procession of the soul from God down through the Homeric 'golden chain' of beings (see Encyclopedists, medieval §3). Martianus Capella's fourth-century allegorical compendium of the Liberal Arts, the *De nuptiis Philologiae et Mercurii*, also conveyed Platonic sentiments (see Encyclopedists, medieval §4), as did Cassiodorus' *Institutiones (Institutions)* and Isidore of Seville's *Etymologiae (Etymologies)* (see Encyclopedists §§6-7). These works were influential from the ninth century to the twelfth century in particular.

The most influential work of Boethius was his *De consolatione philosophiae (Consolation of Philosophy)*, which transmitted a Stoicized Platonism to the medieval world. This work presents the Platonic view that the soul can become forgetful of itself through immersion in the affairs of the body, but that it can recover its essential rational nature and attain to the vision of God. Several poems in the *De consolatione philosophiae* transmit in condensed form a Platonic cosmology, especially III metrum 9, '*O qui perpetua mundum ratione gubernas*' (You, who in perpetual order, govern the universe), which was widely commented on from the ninth century onwards (for example, by Remigius of Auxerre).

Also from the ninth century, medieval authors were exposed to another blend of Platonism deriving from Proclus and emphasizing the transcendence of the divine, to the extent that the divine is better described as non-being than as being. These Christian texts, purporting to be written by Dionysius, St Paul's convert at Athens, and thus as ancient and authentic as the Gospels themselves, were in reality pious forgeries produced by a sixth-century Christian follower of Proclus. Pseudo-Dionysius' *De divinis nominibus (The Divine Names)* examines scriptural and philosophical appellations for the divine and argues that they all fail to fully express the nature of the highest being, who is nameless and beyond all names. Names are really processions from the divinity and do not reach the divinity itself. Negations, in fact, express the nature of the divine more accurately than affirmations. This theme is expressed even more radically in the *De mystica theologia (Mystical Theology)*, which had enormous influence on the later medieval mystical tradition, transmitting to the Latin West the Platonism of the *Parmenides* in the form of negative theology. Pseudo-Dionysius had an enormous influence on Albert the Great, Aquinas, Bonaventure and Grosseteste among others, particularly through his concept of the self-diffusion of the good (*bonum diffusivum sui*), his principle that all things have being through being one, and his notion that the being of all things is the 'above being' of the divinity (*esse omnium est superesse divinitatis*) (see Pseudo-Dionysius).

Both Boethius and Pseudo-Dionysius contributed to the development of medieval Platonism by continuing to emphasize the primacy, transcendence and unspeakability of the one, good God. Pseudo-Dionysius, however, following Proclus, formalized the system of hierarchical levels postulated to exist between the divine One and the formless nothing, chiefly in two books: *De coelesti hierarchia (The Celestial Hierarchy)* and *De ecclesiastica*

hierarchia (The Ecclesiastical Hierarchy). Influenced by Pseudo-Dionysius' Proclean formulations, medieval Platonists thought of reality as a series of ontological levels which proceed from the One right down to the nebulous realm of formless matter.

Johannes Scottus Eriugena, an Irishman who resided at the Carolingian court, produced in the ninth century the first synthesis of the Platonism of Augustine and Pseudo-Dionysius. Eriugena's Platonism is indirect, through Greek Christian Platonists, Basil and Gregory of Nyssa as well as Pseudo-Dionysius. Though aware of the theological differences between the Augustinian and Dionysian traditions, he regarded them as different expressions of the one truth. Eriugena's dialogue *Periphyseon (On the Division of Nature)* developed a Neoplatonic cosmological system which synthesized Dionysian and Augustinian Platonism. All things proceed from and return to the One in an eternal cosmic cycle (*exitus-reditus*), which is at the same time God's self-articulation. The spatio-temporal world which appears solid and corporeal is really an incorporeal world of qualities which emanates from the primordial causes, which are eternal but created ideas in the mind of God. Eriugena boldly identifies Augustine's primary causes with Pseudo-Dionysius' divine willings, thus synthesizing eastern and western interpretations of the Platonic ideas.

All things must return to their source, and the divine ideas will be reunited in God. Human souls are originally one with the One, but in their outgoing they become shrouded in appearances, generating the corporeal body. Each will also return to be one in the Logos, though each soul will remain at the level dictated by the level of its intellectual contemplation. Eriugena follows Gregory of Nyssa in claiming that corporeal body is merely an illusion produced by the commingling of incorporeal qualities, and that the division of the sexes is a consequence of the Fall. The unformed matter from which God creates is really God's own hidden, transcendent nature. Although Eriugena refers to the world soul (*Periphyseon* I.476c), drawing on Macrobius and Virgil, it does not play a significant part in his system but perhaps is to be identified with the Holy Spirit, as in later twelfth-century Platonism.

3 Platonism in the debates about universals

The medieval debate over the ontological status of universals (signified by general terms such as 'animal' or 'man') re-enacts the dispute between Plato and Aristotle over the nature of forms. This problem emerges in Porphyry's *Isagōgē(Introduction)* where, introducing Aristotle's *Categories*, he raises a number of questions while commenting on Aristotle's *De interpretatione (Peri hermeneias)* I 16a 3-18, including whether universals had real existence or were only creations in the mind; if they were real, whether they were corporeal or incorporeal; and if incorporeal, whether they existed apart from sensible things or were contained in them (see Porphyry). Boethius, in his commentaries on Porphyry, suggested an answer to the question which attempted to reconcile Plato with Aristotle. For Boethius, following Aristotle, a universal is by its nature predicable of many things, and hence is not an individual and cannot be a sensible substance. However, neither is it a merely empty category since it is indeed the thought of something. The species is the result of the mind's abstracting from what is given in the senses. The universal is in itself immaterial, but it subsists in material beings and does not exist apart from things, as Plato thought (see Universals).

Medieval interpretations of Boethius led to the dispute between nominalism (identified with Roscelin of Compiègne) and realism (identified with William of Champeaux and Bernard of Chartres). William of Champeaux, a teacher at the Cathedral School of Notre-Dame in Paris, known chiefly through his student and critic Peter Abelard, was an extreme realist. According to John of Salisbury, Bernard of Chartres was also a Platonist about universals, holding that aside from the ideas in God there were created forms (*formae nativae*) that existed apart from God and from the mind (Dutton 1991: 70-96). According to Abelard, William of Champeaux held the view that a universal exists in common in each of the instances; thus man exists identically in Socrates and in Plato. In order to be identical in each instance, it must be identical in itself and to a thing existing apart. Roscelin, on the other hand, maintained that universals were mere names, utterances, 'vocal breath' (*flatus vocis*) as Anselm termed them (see Roscelin of Compiègne).

Peter Abelard, who had been taught by both Roscelin and William, attempted to mediate between these extremes, especially in his *Logica ingredientibus (Logic for Beginners)*. Abelard, who regarded Plato as the 'greatest of philosophers' (*maximus philosophorum*), held a modified Platonism about universals, whereby the universals are held to be forms existing in the mind of God (*conceptio Dei*). He ridiculed the nominalist position that species were merely words, but he was also critical of the view that species were things. Species were predicated of things,

and only words, not things, can be predicated of things. The problem is to decide what ontological status these *predicamenta* (substantial categories) have. For Abelard, a thing is always concrete and individual. When several things, such as humans, share a common nature, what they share is 'being human' (*esse hominem*). This is not itself a thing but neither is it merely a name; it is a concept founded in the thing but not existing in the same mode as the thing. Abelard's interest is in the meaning which is expressed by a proposition, the *dictum* (what is said), which is neither identical with the words nor with the thing but is something intermediate.

4 Twelfth-century Platonism

In the eleventh century, Platonism, mediated through Augustine's works, is evident in Anselm, most notably in the *Monologion* and particularly in this work's acceptance of the existence of the forms and the self-existent highest good. The twelfth century saw a Platonic renaissance, centred mainly in the cathedral schools of Chartres and St Victor (see Chartres, School of; Hugh of St Victor), and was characterized by cosmological speculation inspired by the *Timaeus*, combined with Boethius, Macrobius and Martianus Capella. The challenge was to produce a complete scientific picture in conformity with Genesis from the fragment of Plato's natural philosophy which was known.

From Philo and the Middle Platonists onwards, the parallels between Plato's cosmology in the *Timaeus* and the account of creation in Genesis provided the opportunity for Platonic commentaries on the work of the six days (the *Hexaemera*). *Timaeus* 41c was interpreted as teaching that the world is created by the will of God who is 'Father of all'. Abelard deduced from the *Timaeus* that God - the most perfect being - had created the most perfect world, a doctrine which was revived by Leibniz in the seventeenth century. For twelfth-century authors, Plato's literary method of exposition was similar to Christian parable; Plato taught using fables and symbols (*integumenta*, or 'coverings') which the commentator must interpret.

Using Calcidius' commentary on the *Timaeus* (see §2), twelfth-century Platonists developed an account of the world in terms of the four elements and in terms of complex number symbolisms. Among commentators on the *Timaeus*, perhaps the most Platonic were Bernard of Chartres, Thierry of Chartres and William of Conches. These writers stress the relation between macrocosm and microcosm, and harmony between the divine and created spheres. William of Conches, who probably taught at Chartres, is the most important of the twelfth-century Platonists, and his *Timaeus* commentary is the most extensive medieval commentary on that dialogue. For William, the *Timaeus* is a unified theological work displaying the beneficence of the creator. He also commented on Boethius' *De consolatione philosophiae* and on Macrobius, as well as composing two systematic works, *Philosophia mundi* and a revised version entitled the *Dragmaticon*, set in the form of a dialogue between the Duke of Normandy and the Philosopher. Many Pythagorean elements and much number symbolism was associated with the articulation of cosmology in the twelfth century. Thierry of Chartres in his *De sex dierum operibus (Concerning the Works of the Six Days)* sees creation as an articulation of unity into plurality, following the suggestion of Calcidius.

William, also following Calcidius, sees the *Timaeus* as a work of natural justice showing how God creates and governs the world. God has established an unvarying natural law which is discoverable at the heart of things. For him, God creates the intellectual realm and allows other causes (such as stars) to govern the lower world, thus proposing a doctrine of mediated creation at variance with Augustine's single-act view (see Natural philosophy, medieval). The Chartres school followed Bernard of Chartres in positing a level of created forms between God and sensible reality, influenced by Eriugena's primordial causes and Augustine's seminal reasons (see §2). Seeking to reconcile Plato and Aristotle, as John of Salisbury reports, Bernard of Chartres posited intermediaries between God and created things. These native forms (*formae nativae*) link the eternal archetypes to passive matter (*hyle*) (see Chartres, School of).

William's account of creation discusses the role of the four elements in detail. Like others (for example, Adelard of Bath), William saw himself as expanding on the teaching of Plato: 'It is not my intention to expound here the words of Plato, but to set down here the view of natural scientists [*physici*] concerning substances; but even if I have not expounded Plato's words, I have said all that he said about elements, and more' (*Dragmaticon*, quoted in Dronke 1988: 309). He attempts to define the elements and addresses the question as to whether they are perceptible by the senses and corporeal and whether the division of matter ends with these indivisibles (atoms). William takes the view that the four elements are corporeal, unchanging substances which, however, are only

found in combination. The elements then are corporeal but are actually grasped by intellect since they are too small to be perceived by the senses on their own. Though they are unchangeable, they are created. God first made the four elements from nothing and then everything else out of the four elements, except the soul of man, which God made directly.

A major challenge to Christianizing Plato's cosmology was to interpret the role played by the Platonic Demiurge (see Plato §16). Christian Platonists were initially quick to identify the Demiurge with the Logos, the Second Person of the Trinity. This allowed them to make a further identification between the Holy Spirit and the world soul (*anima mundi*), which in the *Timaeus* enlivens the material cosmos. William of Conches initially, in his commentary on Macrobius, quite boldly identified the world soul of the *Timaeus* with the Holy Spirit, as Abelard was alleged to have done. The Council of Sens had condemned the identification, attributing it to Abelard. William then appears to have grown more cautious, simply offering a number of different views in his *Philosophia* Book One (the world soul is the Holy Spirit, or a natural force implanted in things by God, or a certain incorporeal substance in bodies) and making no reference to the world soul in his *Dragmaticon*.

Bernard Silvestris, in his partly versified, allegorical account of the creation, the *Cosmographia*, makes use of many Platonic ideas from the *Timaeus*, including that of a world soul personified as Endelichia (who also appears in Martianus Capella and Cicero), but in a manner quite different from William of Conches. Bernard has a world of ideas (Noys) and a domain of unformed matter (personified as Silva - Calcidius' term for 'matter'). Gradually Noys imposes order on Silva until the whole world has been made. The sensible world imitates the intelligible; man is a microcosm of the macrocosm. Bernard also saw Plato as beginning with two principles: *unitas et diversum*, unity and diversity (see Bernard of Tours). William of Conches explicitly connects Plato with Pythagoras, and argues that since number possesses the highest perfection, nothing can exist without number. Another Platonic cosmology in versified form was Alan of Lille's *De planctu naturae (The Lament of Nature)*, a dialogue between the poet and Nature, which was influenced by Bernard Silvestris.

5 Platonism in the thirteenth century

Thirteenth-century knowledge of Plato drew on the usual sources in Augustine and Latin writers, but also gained new insights into Plato from criticisms contained in the rediscovered works of Aristotle and his Arabic commentators, especially Averroes (see Ibn Rushd). Rather stiff literal translations of the *Meno* and *Phaedo* were produced by Henricus Aristippus in the 1150s; although listed in the library of the Sorbonne after 1271, these texts were not much studied and had little influence. Similarly, William of Moerbeke's translation of part of the *Parmenides* with Proclus' commentary also had little influence until popularized by Nicholas of Cusa. Moerbeke also translated Proclus' *Elements of Theology* which was available to Thomas Aquinas. Moerbeke's follower, the Flemish encyclopedist Henry Bate, was one of the first to be able to discern the difference between Plato's own texts and the later Platonism of Proclus. In general, however, Platonism in the thirteenth century survived mainly in the universities' theology faculties, as the arts faculty syllabuses were gradually reorganized to accommodate the new Aristotelianism.

One of the most influential texts for thirteenth-century philosophers was the *Sentences* of Peter Lombard. Lombard stated that Plato had three principles to explain the cosmos: matter, forms and the divine artificer, whereas Aristotle had only two: matter and species. This passage was regularly commented on to clarify whether Plato and Aristotle accepted the doctrine of creation, and whether they thought that creation was compatible with the beginninglessness of the world (as Aquinas held). In his commentary on the *Sentences*, Albert the Great acknowledged that Plato had posited a world of forms that existed independently of the mind of God. Albert's outlook was strongly influenced by Neoplatonism and no doubt helped to shape the Platonism in the thought of his student, Thomas Aquinas.

Though Aquinas is the great exponent of the new Aristotelianism, adopting Aristotle's criticisms of the univocal understanding of the good in Plato and other criticisms of the existence of the Ideas, yet he remains quite Platonic in other domains, for example, in his account of participation (how created things participate in being and receive the gift of *esse* from the divine being) which was strongly influenced by Pseudo-Dionysius. Aquinas sides with Aristotle against Platonism, which he sees as a doctrine that overstressed the mind's intellectual capacities, claiming that humans could know immaterial forms directly without mediation of the senses. In *Summa contra gentiles* I.13.10, in his discussion of the argument for the existence of God from motion, Aquinas explicitly

discusses the difference between the Platonic and Aristotelian conceptions of the nature of motion, drawing on *Phaedrus* 245c. His source, however, is not directly Plato but more probably the tradition stemming from Calcidius and Macrobius.

Robert Grosseteste translated and commented on Pseudo-Dionysius. His *De luce(On Light)* offers a typically Neoplatonic cosmology and metaphysics of light. Grosseteste's account of the soul weds Aristotelian naturalism with a Neoplatonic account of the higher principles of intellect and reason.

Platonism in the thirteenth century is often associated with members of the Franciscan order and with a mathematical approach to the understanding of nature. Richard Rufus of Cornwall defended Plato's theory of ideas against Aristotle's criticisms, and Bonaventure's *Itinerarium mentis in Deum (Journey of the Mind to God)* is thoroughly Platonic (see Bonaventure). Bonaventure accepted a form of Augustinian illuminationism, a Christianized version of Platonic recollection (see Augustinianism). For Bonaventure, sensible things are traces of divine things. In typically Platonic terms, Bonaventure's sixth step in the mind's advancement towards God refers to the Good beyond being.

The later thirteenth century saw a re-emergence of an Averroist Platonism, particularly with regard to the knowledge of separate substances. Siger of Brabant, for example, took a more Platonic line than Aquinas had done in arguing for the soul's direct knowledge of separate intelligible substances. Henry of Ghent's doctrine of the separate being of essences (*esse essentiae*) was also considered Platonist (see Henry of Ghent). Meister Eckhart held Neoplatonic, Proclean-inspired theories of the nature of the soul, and his affirmation of an uncreated part of the soul parallels the doctrine of the undescended part of the soul in pagan Neoplatonism (see Neoplatonism). The German Dominican writers Dietrich of Freiberg and Berthold of Moosburg are more openly favourable to Plato and Proclus, with Berthold writing a commentary on Proclus' *Elements of Theology*.

Nicholas of Cusa appears to have introduced William of Moerbeke's Latin translation of the *Parmenides* to a medieval audience, and he was also familiar with Proclus' *Commentary on the Parmenides*. Nicholas developed a strongly Neoplatonic account of the nature of the divine being who so transcends and reconciles all oppositions as to be called the 'coincidence of opposites' (*coincidentia oppositorum*), echoing Eriugena's view of God as 'the opposite of opposites' (*oppositio oppositorum*). Drawing on the twelfth-century hermetic text *The Book of the Twenty-Four Philosophers*, Nicholas represents God as an infinite sphere whose centre is everywhere and whose circumference is nowhere. Elsewhere, for example in *De li non aliud (On the Not-Other)*, he develops the immanence and transcendence of God. In *De docta ignorantia (On Learned Ignorance)*, Nicholas expresses the Platonic view that forms or notions exist separately from the things of which they are the forms, rejecting Aristotle's criticisms as shallow misunderstandings. Here Nicholas follows Eriugena and Thierry of Chartres in calling God 'form of all' (*forma omnium*), 'form of being' (*forma essendi*) and 'form of forms' (*forma formarum*). For Nicholas, all forms exist as one in God but 'contractedly' in created things.

Platonism, Renaissance

Though it never successfully challenged the dominance of Aristotelian school philosophy, the revival of Plato and Platonism was an important phenomenon in the philosophical life of the Renaissance and contributed much to the new, more pluralistic philosophical climate of the fifteenth and sixteenth centuries. Medieval philosophers had had access only to a few works by Plato himself, and, while the indirect influence of the Platonic tradition was pervasive, few if any Western medieval philosophers identified themselves as Platonists. In the Renaissance, by contrast, Western thinkers had access to the complete corpus of Plato's works as well as to the works of Plotinus and many late ancient Platonists; there was also a small but influential group of thinkers who identified themselves as Christian Platonists. In the fifteenth century, the most important of these were to be found in the circles of Cardinal Bessarion (1403-72) in Rome and of Marsilio Ficino (1433-99) in Florence. Platonic themes were also central to the philosophies of Nicholas of Cusa (1401-64) and Giovanni Pico della Mirandola (1463-94), the two most powerful and original thinkers of the Quattrocento. While the dominant interpretation of the Platonic dialogues throughout the Renaissance remained Neoplatonic, there was also a minority tradition that revived the sceptical interpretation of the dialogues that had been characteristic of the early Hellenistic Academy.

In the sixteenth century Platonism became a kind of 'countercultural' phenomenon, and Plato came to be an important authority for scientists and cosmologists who wished to challenge the Aristotelian mainstream: men like Copernicus, Giordano Bruno, Francesco Patrizi and Galileo. Nevertheless, the Platonic dialogues were rarely taught in the humanistic schools of fifteenth-century Italy. Plato was first established as an important school author in the sixteenth century, first at the University of Paris and later in German universities. In Italy chairs of Platonic philosophy began to be established for the first time in the 1570s. Though the hegemony of Aristotelianism was in the end broken by the new philosophy of the seventeenth century, Plato's authority did much to loosen the grip of Aristotle on the teaching of natural philosophy in the universities of late Renaissance Europe.

1 The revival of Plato

'More men praise Aristotle; greater men, Plato.' So wrote Petrarch (see Petrarca, F. §2) around 1368 in the invective *De sui ipsius et multorum ignorantia (On His Own Ignorance and That of Many Others)* (completed in 1371). Petrarch's opinion came to be representative of the humanist movement in general during the Renaissance (see Humanism, Renaissance). The humanists deplored the extent to which Aristotle dominated the philosophical curricula of contemporary universities. They knew from their classical reading that the ancients, both pagan and Christian, had considered Plato to be the greatest of philosophers. They also knew that the Byzantines, their schoolmasters in matters Greek, had regarded the study of Aristotle's writings as propaedeutic to that of the 'higher', more sublime philosophy of Plato. The neglect of Plato thus became for humanists a standard part of their polemic against scholasticism's narrowness as an educational programme. The humanists, like their idol Cicero, wished to see the educated elites of Renaissance Italy introduced to the full range of ancient philosophy. Hence the humanist project to restore the educational values of classical antiquity brought about the revival of Platonic studies in the early Renaissance.

The study of Plato had not been entirely neglected in the Middle Ages (see Platonism, medieval). Medieval readers had inherited from antiquity two partial versions of the *Timaeus* made, respectively, by Cicero and Calcidius, and Calcidius' rendering, accompanied by his commentary, had been among the most widely-studied texts of the twelfth century. Henricus Aristippus in the mid-twelfth century had translated the *Phaedo* and the *Meno*, and around 1280 Aquinas' translator, the Dominican William of Moerbeke, translated Proclus' commentary on the *Parmenides*, which included much of Plato's text in the lemmata. Much was also known indirectly of Plato's writings via the Latin philosophical tradition, especially Cicero, Apuleius, Macrobius and Augustine, as well as through Avicenna and other Arabic philosophers. The Latin Aristotle, too, was important for the medieval knowledge of Plato; the arguments of the *platonici* in favour of metaphysical realism frequently cited by scholastic philosophers came mostly from this source.

Still, the Italian humanists in the course of a single century did far more to make Plato available in Latin than ten centuries of Western medieval scholarship had done. Leonardo Bruni (see Aristotelianism, Renaissance §7;

Humanism, Renaissance §§5, 7), Uberto Decembrio and Cencio de'Rustici, all pupils of the émigré Greek Manuel Chrysoloras (d. 1415), translated among them some ten dialogues, including the *Gorgias*, *Crito*, *Phaedo*, *Apology* and *Republic*. In the following generation the *Republic* was translated twice more, by Uberto Decembrio's son Pier Candido and by the Sicilian Antonio Cassarino. The Milanese humanist Francesco Filelfo translated the *Euthyphro* and some of the *Letters*, while in Rome the papal secretary Rinuccio Aretino rendered the *Crito*, *Euthyphro* and *Axiochus*. George of Trebizond, a humanist and papal secretary from Venetian Crete, turned the *Laws*, *Epinomis* and *Parmenides* into Latin. In 1462 Pietro Balbi, a protégé of Nicholas of Cusa and Bessarion, translated Proclus' *Platonic Theology*. In Florence, Lorenzo Lippi da Colle, a neo-Latin poet and protégé of Piero de'Medici, translated the *Ion*. The translation activity of the humanists culminated in the work of Marsilio Ficino, who in 1484 published the first complete Latin version of Plato's works and in 1496 published a series of annotations and commentaries on the major dialogues. Ficino also published in Latin the complete works of Plotinus and a number of works by minor ancient and Byzantine Platonists. So while in 1400 the Latin world possessed only two complete and two partial versions of the Platonic dialogues and a developed commentary tradition only on the *Timaeus*, by the end of the fifteenth century it had available in Latin all thirty-six dialogues of the Thrasyllan canon, the pseudo-Platonic *Definitions* and *Halcyon*, three of the six *Spuria*, and a large and sophisticated body of ancient and modern commentaries and other aids to the study of Plato's texts.

The progress of Platonic studies continued in the sixteenth century. Ficino's *Platonis opera* in Latin was revised three times (1532, 1557 and 1592) and there were two fresh Latin versions of the complete works, those of Janus Cornarius (1561) and Jean de Serre (1578). The *editio princeps* of Plato in Greek, edited by Marcus Musurus, was published by Aldus in 1513. It was followed by the major recensions of Simon Grynaeus (1534), Marcus Hopper (1556) and Henri Estienne (1578). The latter edition remained standard until the early nineteenth century. The trickle of vernacular translations of Plato that began in the fifteenth century turned into a flood in the sixteenth, though the first complete edition of Plato's works in a vernacular language was Dardi Bembo's Italian version published in 1601.

Renaissance scholarship on the text of Plato was not always accompanied by an understanding of Platonic thought. Before the time of Bessarion and Ficino humanist translators commonly had a very imperfect grasp of the philosophical arguments and doctrines they were endeavouring to translate. Since they were eager for Plato to be accepted in the Christian world, it was common for them to bowdlerize (especially passages alluding to homosexuality) and Christianize (especially references to polytheism). After the middle of the Quattrocento, however, Renaissance humanist scholars and Platonists largely accepted the guidance of the ancient Neoplatonic tradition in interpreting the works of Plato. Thanks largely to Cardinal Bessarion's *In calumniatorem Platonis (Against Plato's Calumniator)* (1469) and Ficino's commentaries on Plato, Neoplatonic interpretations of Plato dominated the later Renaissance and continued to find followers in the early modern period, down to Thomas Taylor and Samuel Taylor Coleridge in the later eighteenth century. Despite the dominance of the Neoplatonic Plato, however, there was from the beginning of the Renaissance a minority tradition of interpreting Plato. In antiquity itself the theological Plato of the Neoplatonists had been balanced by the sceptical Plato of the New Academy. In Cicero and in Augustine's *Contra Academicos (Against the Academics)* Renaissance humanists met another Plato, a Plato without positive doctrines of his own, an ironic and playful doubter who liked to disguise his own opinions while presenting all points of view in inconclusive dialogues. One can find traces of this sceptical Plato in many Renaissance writers, from Petrarch (see Petrarca, F.) and Leonardo Bruni in the early Renaissance to Melanchthon, Nizolius, Ramus and Montaigne in the sixteenth century. Yet only rarely do those who view Plato as a sceptic work out their interpretation in detailed readings of the dialogues themselves. The most famous, indeed almost the only example of this, is Giovanni Pico della Mirandola's reading of the *Parmenides* as a dialectical display, an interpretation which explicitly challenged Ficino's theological reading (see Pico della Mirandola, G. §2).

In the sixteenth century Renaissance interpreters of Plato began to move away from these traditional alternatives. Although the credit for distinguishing between Plato's original doctrine and that of his Neoplatonic interpreters is often given to Friedrich Schleiermacher in his 1804 edition of Plato, in fact the distinction has a long prehistory in Renaissance and early modern scholarship, going back to Jean de Serre's introduction to the Stephanus edition (1578) of Plato. The Protestant reformers were highly suspicious of rationalistic theologies in general and attempts to combine pagan philosophy with Christianity in particular. They were as hostile to Ficino's attempt to base

Christian theology on Plato as they were to the Aristotelian theology of the scholastics. Protestant scholars who wanted to save Plato from the Florentine Platonists declared either that he should be read purely as literature, laying aside his theological views, or, like Jean de Serre, that his true philosophy needed to be cleansed of 'les gloses des Platoniciens'. Although de Serre's own attempt to reconstruct Plato's original philosophical views was not impressive, the principle he enunciated allowed later interpreters such as Isaac Vossius, Leibniz, and Jakob Brucker (author of the first critical history of philosophy), to shake off the Neoplatonic interpretation of Plato.

2 Renaissance anti-Platonism

The virulence of the opposition to the Platonic revival explains much about the character of that revival and about the approaches to Plato characteristic of Renaissance Platonists. Though Aristotle had been successfully domesticated in European universities during the thirteenth century (see Aristotelianism, medieval §4), this circumstance did little to smooth the path for Plato in the fifteenth. The attempt to revive the Platonic texts during the early Renaissance was opposed by a number of authoritative figures such as the Dominican reformer Cardinal Giovanni Dominici, St Antoninus (the Archbishop of Florence), Pope Paul II and the famous preacher Girolamo Savonarola. Scholastic opponents of Plato in the sixteenth and seventeenth centuries repeated the same criticisms over and over again. But criticism of Plato was not confined to scholastics. A number of humanists and patrons of the humanities also had reservations about renewing the study of Plato. Indeed, Plato's chief critic in the fifteenth century was George of Trebizond, a humanist and papal secretary, whose *Comparatio philosophorum Aristotelis et Platonis (Comparison of the Philosophers Aristotle and Plato)* (1458; printed in 1523 as *Comparationes philosophorum Aristotelis et Platonis*) constituted a compendium of Renaissance anti-Platonism. Trebizond's arguments presented a real challenge to the Platonic revival. The humanist movement had battened on the promise that the recovery of antiquity would mean the recovery of sound moral doctrine and brilliant examples of virtue. Plato represented a threat to this humanist project on several fronts.

The criticisms may be reduced to three. The first was the charge that Plato's teaching was unsystematic and therefore pedagogically useless. Critics complained that his doctrine was too obscure, being hidden under the personae of interlocutors who contradicted each other. Socratic dialogue was considered far more difficult to follow than the Ciceronian dialogues popular among the humanists. At the same time Plato, unlike Aristotle, had neither divided his works systematically by subject matter nor adapted them to the understanding of beginners. As a result, it was difficult for teachers to lecture on Plato's writings in the painstaking, line-by-line fashion employed in Renaissance schools and universities, and it was difficult for students to memorize and retain his doctrine. The second and more serious set of charges focused on the moral deficiencies of the dialogues. Most notorious were the passages in Book V of the *Republic* where Plato has Socrates advocate a system of common ownership of women, children and goods; abortion; female military service; and other doctrines. Criticism of Platonic communism had a long history, from Aristotle himself to Lactantius, Jerome and Gratian's *Decretum* (the most popular medieval textbook of church law), and the doctrine had been routinely condemned in the Middle Ages, first by canon lawyers and later by scholastic commentators on *Politics* II. In the Renaissance, however, humanists through their translations gave direct access to the text of Plato and so revived the storm of disapprobation. Plato's critics declared that any philosopher who promoted such doctrines should not be read in schools. Other passages caused different kinds of trouble. Dialogues such as the *Lysis*, *Charmides* and *Symposium*, depicting scenes of homosexual gallantry, caused grave offence. It was difficult to understand why Plato had spent the first two books of the *Laws* arguing for the value of drunkenness in moral education. And in the *Laws* as in other dialogues Plato gave unequivocal approval to the worship of the gods of the Greek Pantheon - gods whom the Fathers of the Church had identified as demons. Plato even admitted that Socrates had lived his life in obedience to a demon.

This leads to the third group of charges against Plato: that his theological views were incompatible with Christian truth. The humanists, quoting a famous passage in Augustine's *De civitate Dei (The City of God)*, had argued that Plato's belief in individual immortality and creation made his theology closer to Christianity than Aristotle's (see Augustine §8). Plato's critics replied that, whatever his merits as a theologian, they were outweighed by his defects. They attacked his heterodox views on the pre-existence and transmigration of souls. They noted that, even if Plato had believed in creation, he had not believed in creation *ex nihilo*; in the *Timaeus* it seemed that the 'receptacle' (or 'prime matter', as it was called by Renaissance interpreters) was already in being at the moment of creation. Other critics believed that the subordinationist architecture of Plato's intelligible cosmos (as explicated

by later Platonists) had encouraged the Arian heresies of the fourth century and was therefore dangerous. Though there were similar theological problems with the reception of Aristotle, Plato's critics pointed out that, in the case of Aristotle, it was possible to separate the unorthodox parts from the useful parts. If his *Metaphysics* and On the Soul were dangerous, they could be omitted or read only after suitable formation. The student could benefit from the Organon or *On Generation and Corruption*, where logic and physical questions were dealt with (it seemed) in isolation from theology. But in the case of Plato, this could not be done. The immortality proofs of the *Phaedo* and *Meno* were mixed up hopelessly with the doctrine of pre-existence. The myth of creation in the *Timaeus* was inseparable from passages that appeared to posit the eternity of unformed matter. The refutation of atheism in *Laws* X was advanced in support of a system of polytheistic cultus. Socrates' description of the ascent to the form of Beauty in the *Symposium* is made among the drunkenness and disordered passions of a pagan dining party.

The advocates of Plato did their best to protect him. As has been noted, many humanist translators bowdlerized obscure or unorthodox passages in their translations. Pier Candido Decembrio employed an elaborate system of arguments, prefaces, glosses and chapter headings in his translation of the *Republic* to give the impression that the work was a systematic treatise on politics and not the welter of obscure and multidirectional argument it appeared to be at first sight. Later Quattrocento interpreters of Plato had more sophisticated ways of defending Plato. The pagan Platonists of late antiquity, in rivalry with Christian theologians of the time, had converted the Neoplatonism of Plotinus into a systematic theology and had developed elaborate hermeneutical methods designed to educe this theology from the dialogues of Plato. The hermeneutics of the later Platonists, especially Proclus, were taken over by Bessarion and Ficino and applied anew to Plato's works. The technique of allegory was particularly useful in dealing with offensive or heterodox passages. Certainly, any fifteenth-century reader who had wanted to understand the dialogues of Plato in depth would naturally have resorted to the late ancient commentators on Plato simply because they were among the few available guides to his thought. But the recovery of the Neoplatonic interpretation of Plato was also driven by the need to protect him from the criticism of contemporaries.

3 Cardinal Bessarion and the Roman academy

The interest of the popes and the papal court in Plato goes back to the very beginnings of the Platonic revival, when Bruni dedicated his translation of the *Phaedo* to Innocent VII in 1405. A fair proportion of the early humanist translations of Plato can be associated with Roman cardinals or with the papal court, and about a quarter of the approximately 350 manuscripts containing these versions are of Roman provenance. The correspondence of Roman humanists in the first half of the Quattrocento is filled with references to the opinions and sayings of Plato. In this period, the interest of the Roman curia in Plato, reflecting its devotion to humanist ideals, was mostly literary, moralistic and apologetic. From Cicero, Seneca and other Latin sources the Romans had become curious about the figure of Socrates as a model of virtuous conduct. They were delighted to find confirmation of Christian truths in Plato's eschatological myths and in his proofs of the immortality of the soul. They were attracted by Plato's ability to place his literary skill at the service of moral and religious lessons.

With the Council of Ferrara/Florence in 1438-9, however, there was a decisive shift in interest towards Plato's cosmology, his mathematical physics and particularly his psychology and theology. There were two principal reasons for what might be called the 'metaphysical turn' in the reception of Plato. The first was the presence at the Council of the Greek philosopher Gemistos (who later changed his name, rather mysteriously, to Pletho). The Council of Ferrara/Florence had been called in an attempt to put an end to the schism between the Greek and Latin churches, and Pletho, among the most learned men of the Greek world, had been taken along by the Greek delegation as a theological adviser. Though Pletho was later accused of paganism by the conservative cleric George Scholarios (later to become the Orthodox Patriarch Gennadios) as well as by the equally conservative Roman convert, George of Trebizond, it is unclear whether he was really a pagan or rather an extreme syncretist who combined Orthodox Christianity with other forms of religious wisdom, including Platonism. Platonism, which Pletho referred to as 'the Hellenic theology', was in any case not to be identified with the 'vulgar' ancient polytheism of myth and cult, but was an esoteric religious wisdom known to the better minds among the ancient pagans. The key to understanding this hidden wisdom for Pletho was the *Platonic Theology* of Proclus, which Pletho saw as a kind of *summa* or systematic treatment of the Platonic dialogues. Pletho believed himself to have prophetic powers and predicted that within a short time Christianity and Islam would disappear, to be replaced by a new, purified Hellenic theology based on Plato.

The paganizing and prophetic sides of Pletho's thought, however, remained hidden at the time of the Council. During the Council Pletho attracted attention chiefly for his lectures, later published under the title *De differentiis Platonis et Aristotelis (On the Differences between Plato and Aristotle)* (1439). These were attended by many Westerners, who thus received their first initiation into the Neoplatonic interpretation of Plato. They were intended to illustrate two main themes: the superiority of Plato to Aristotle in terms of their relative compatibility with Christianity, and the basic concord of Plato with Aristotle.

These themes had considerable resonance at the Council. The council's purpose was to reconcile the theology of the Latins, whose speculative development was based largely on Aristotelian logic and natural science, with the theology of the Greeks, heavily indebted to the form of late Platonism associated with Pseudo-Dionysius the Areopagite. To the Byzantine cleric Bessarion (who in 1439 was created a cardinal of the Roman church) Platonism seemed to offer a formula for reconciling the two traditions. Ancient Platonists had believed that there existed beyond the multiplicity of ordinary sense-experience radical unities in the cosmos, and that these unities were cognizable only in a heightened state of awareness called *noesis*. Since language was based on sense-experience, it was inadequate for representing the radical unities of the divine realm. The discursive reasoning and dogmatic definitions of the Latins were thus inappropriate tools for theology. Platonism, regarding dogmas, liturgical forms and creeds as inadequate approximations or symbols of inexpressible truths, could thus provide the basis for a theology of concord between Greeks and Latins. Both Greek and Latin creeds could be true, even if they seemed opposed from the viewpoint of discursive reasoning. Bessarion used this conception to convince the Greeks that they were not abandoning Orthodoxy by acceding to Latin liturgical practices and Latin formulations of the creed. The belief that a theology of concord could be built upon Platonic foundations proved a durable one. It was responsible for much of Platonism's popularity in the dawning age of religious controversy, while Aristotelian theologies were frequently blamed for rigidity and dogmatism. Platonic concordism was an important element in the philosophical development of Nicholas of Cusa, whose famous treatise *De docta ignorantia (On Learned Ignorance)* (1440) grew out of reflection on the theological issues of the Council.

Following the Council there arose a dispute among the intellectuals of the émigré Greek colony in Rome whose headquarters was Bessarion's palace library or 'academy'. The dispute lasted for thirty years. At issue was whether Platonism or Aristotelianism formed a better speculative framework for Christian theology. Behind this issue lay the even more charged question of whether and how the Byzantine theological tradition might be integrated with the Latin. This 'Plato-Aristotle Controversy', as it is called, culminated in George of Trebizond's *Comparatio philosophorum Aristotelis et Platonis* (1458) and Bessarion's reply, *In calumniatorem Platonis* (drafted 1459, printed 1469). The aim of George's work was to show the total incompatibility of Plato (and by implication, the 'corrupt' traditions of Byzantine theology) with the 'pure' Aristotelian theologies of the Latin church. Bessarion's *In calumniatorem* in Books I, III and IV consisted of a point-by-point refutation of George's *Comparatio*, while Book V sought to discredit George by attacking his translation of Plato's *Laws*. Book II provided a summary of Platonic theology, based on the Greek Church Fathers and on late ancient Platonists, particularly Proclus. In addition to introducing the Latin West to the late ancient and Byzantine view of Plato's theology, Bessarion's work made clear for the first time to Western scholars the degree to which the theological tradition of ancient Greek Christianity had been indebted to Platonism. The publication of his *In calumniatorem* coincided with the beginnings of the Renaissance revival of the Greek Fathers, and the latter did much to increase the popularity of Platonism in the later fifteenth and sixteenth century.

4 The Platonism of the Florentine school

Florentine humanists had been interested in Plato from the late fourteenth century, when Coluccio Salutati had acquired copies of Calcidius and of Henricus Aristippus' translation of the *Phaedo*. The interest continued in the early fifteenth century with Leonardo Bruni (see Aristotelianism, Renaissance §7; Humanism, Renaissance §§5, 7), who dedicated two of his seven translations of Plato to Cosimo de'Medici, the great banker, politician and patron of arts and letters. The Medici over several generations played a key role in the revival of Plato in Florence. Cosimo de'Medici is said to have heard Pletho's lectures during the Council of Florence, and it was probably from Pletho that Cosimo purchased the manuscript of Plato's dialogues he later gave to Marsilio Ficino to serve as a basis for his translation. In 1462 Cosimo gave Ficino a house in Florence and a farm in the countryside near his own villa of Careggi. Cosimo's grandson, Lorenzo 'the Magnificent', continued to support Ficino by acquiring

several benefices for him and paying the printing costs of some of his scholarly works. Ficino had other patrons besides the Medici, and the Medici supported philosophers of many other schools besides Ficinian Platonism, but by the early sixteenth century the Medici had acquired a reputation for special devotion to Plato. In 1513, the *editio princeps* of Plato's works in Greek was dedicated to the Medici pope, Leo X, whose father Lorenzo had received the dedication of Ficino's Latin translation of Plato thirty years earlier.

Ficino and Cristoforo Landino were the two central figures in the Florentine school of Platonism. Landino was a professor of rhetoric and Latin literature at the University of Florence who gave Platonizing interpretations of various literary works, most famously Virgil's *Aeneid* and Dante's *Divina Commedia (Divine Comedy)*. Landino also composed the *Disputationes Camaldulenses (Camaldulensian Disputations)* (1472), a brilliant depiction of Lorenzo's entourage engaged in philosophical discussions about the immortality of the soul. These dialogues show better than any other source the character of Florentine Platonism during the 1470s. Marsilio Ficino, one of the greatest scholars of the century, was only briefly a professor at the University; he kept instead a private *gymnasium* or *academy* where he educated numerous members of the Florentine elite. He also gave public lectures on Plato and Plotinus and maintained a large philosophical correspondence. He translated all the works of Plato and Plotinus in addition to those of a number of other ancient Neoplatonists, and wrote a major work amassing arguments to prove the immortality of the soul. Besides Ficino, Landino and their pupils, it is hard to find other important intellectuals in the Florence of Lorenzo de'Medici who were deeply influenced by Platonism. Johannes Argyropoulos, while lecturing at the University of Florence, introduced Platonic elements into his explications of Aristotle. Angelo Poliziano came briefly under Ficino's spell during the mid-1470s, when he produced his Platonizing *Stanze per la giostra (Stanzas for the Tournament)* and an unfinished translation of the *Charmides*. The astronomer Lorenzo Bonincontri, the humanist Bartolomeo Scala and the philosopher Giovanni Pico della Mirandola all made eclectic use of Ficinian Neoplatonism. Most important of all, from the point of view of spreading interest in Platonism, was Lorenzo de'Medici himself, whose Italian poetry frequently contained themes, images and conceits borrowed from Ficino's writings.

While the chief theme of Bessarion's Platonism was the integration of Greek and Latin theological traditions, Ficino's Platonism was broader and more polymorphous in its interests. Ficino considered his main role to be that of a theological reformer. He wanted to restore Platonism to its ancient function as the handmaid of Christian theology, replacing the failed Aristotelian syntheses of Christianity and Aristotle that had characterized the medieval period. His chief concern as a philosopher was establishing a rational basis for the doctrine of the immortality of the soul, the key issue separating 'secularizing' from 'Christianizing' Aristotelians in Italian universities of the Renaissance. But Ficino and his followers were also interested in using the truths of Platonism to explore many other subjects, including astrology, magic, medicine, literary theory, musical theory and the theory of love.

With the fall of the Medici in 1494 and the coming of Savonarola, Ficinian Platonism was temporarily eclipsed, and many of his followers became Savonarolans. In the sixteenth century, interest in Ficino's work revived and his Platonism exerted a broad cultural influence. Especially popular was Ficino's 'philosophy of love', which provided European poets in the Petrarchan tradition with a new repertory of conceits and images. It is nevertheless difficult to find professional philosophers who could be called Ficinian Platonists. In Florence, Francesco Cattani da Diacceto continued Ficino's work during the first Medici Restoration, but disagreed with him on many points, preferring the concordism of Pico. Later in the century Francesco de'Vieri the Younger attempted another revival of Ficinian Platonism. In Rome, Ficino's most important epigone was the Augustinian Giles of Viterbo, a preacher and theologian of the papal court whose theology is thought to have influenced the programmes of Michelangelo's decoration of the Sistine Chapel ceiling and Raphael's frescos in the papal *Stanze*. The definition of the immortality of the soul as an official Catholic dogma by the Fifth Lateran Council (1512-7) may be partly credited to Giles' influence and to that of Ficino's former pupil, Pope Leo X. Ficino's studies of magic and the occult were appropriated by figures as diverse as Symphorien Champier, Agrippa von Nettesheim, Paracelsus and Giordano Bruno. Ficino's belief in an 'ancient theology' (see Ficino, M. §2) remained influential, even after the *Corpus Hermeticum* was exposed as a forgery by the Protestant scholar Isaac Casaubon in the early seventeenth century. Finally, Ficino's contention that Plato's philosophy was more compatible with Christian theology than Aristotle's continued to find numerous champions among both humanists and scholastics for more than a century.

5 Plato in humanist schools and in universities

Despite the intellectual energies expended on the Platonic revival of the fifteenth century, it was a long time before the dialogues of Plato were included regularly in the curricula of Renaissance schools and universities. Manuel Chrysoloras, the Byzantine émigré who taught the first generation of Italian humanists to learn Greek, seems to have read the *Gorgias* and the *Republic* privately with some of his pupils. There is some evidence that the famous humanist schoolmasters Guarino Veronese and Gasparino Barzizza used Chrysoloras' Latin translation of the *Republic* in private tutorials with certain students. George of Trebizond reports having heard lectures on the *Gorgias* in the school of another famous schoolmaster, Vittorino da Feltre, presumably in the 1420s, and the Byzantine Theodore Gaza, who had been an assistant to Vittorino, lectured on the same text at the University of Ferrara in 1446. In Battista Guarino's educational tract, *De ordine docendi et studendi (A Plan of Teaching and Study)* (1456) - a work said to capture the educational practice of Guarino Veronese - the reading of Plato and Aristotle is recommended as the crown of a long programme of humanistic studies, but it is not known how often, if ever, the full programme was carried out. In 1459 another Byzantine, Johannes Argyropoulos, is said to have lectured privately in Florence on Plato's *Meno*. Ficino gave public lectures on Plato's *Philebus*, Plotinus' *Enneads*, and no doubt other texts as well, but these lectures were probably not part of any school or university course of study.

In the 1490s the study of Plato spread to Northern Europe with the lectures of Paulus Niavis (Paul Schneevogel) on the pseudo-Platonic *Epistulae (Letters)* and *Erastes* (in Ficino's translations) at the University of Leipzig. From the first decade of the sixteenth century until the 1580s there was considerable interest in Plato among humanistically inclined masters at the University of Paris and particularly at the Collège Royale. A number of famous French classical scholars such as Jérôme Aleander, Denys Lambin, Adrien Turnèbe and Marc-Antoine Muret are known to have lectured on a wide variety of texts. Most of these texts were chosen from among shorter and easier dialogues of interest to students of literature, such as the *Crito*, *Apology*, *Hipparchus*, *Minos*, *Theages*, *Euthyphro*, *Cratylus*, Book I of the *Republic*, Socrates' speech from the *Symposium*, and the pseudo-Platonic *Epistulae*. Turnèbe was rather more ambitious, giving courses on the *Timaeus* and *Phaedo*, among other texts. Petrus Ramus used Plato as a stick with which to beat Aristotle in his famous anti-Peripatetic lectures, and encouraged the study of Plato by making his own translation of the pseudo-Platonic *Epistulae*. It was in part Ramus' influence that led to a renewed interest in Plato in German *gymnasia* of the late sixteenth century. The reformer and humanist Johannes Sturm had lectured on the *Gorgias* in Strasbourg as early as the 1540s, but in the 1580s and 1590s there were schools in Cologne, Nuremberg, Rostock and Strasbourg where students could study the *Apology*, *Gorgias*, *Theaetetus*, *Phaedrus* and *Republic*.

With the exception of Ficino's lectures almost all of this study took place in humanist schools or as a result of university lecture courses given by humanists. The emphasis was mostly on grammar and on providing general moral and cultural formation. Scholastic philosophers for a long time did not lecture on Plato nor make him the subject of their professional attentions; Pico's proposal to defend Platonic theses in 1487, had it taken place, would have been the first known instance of a scholastic disputation involving Platonic texts (see Pico della Mirandola, G. §1). This began to change at the end of the fifteenth century when in 1497 Niccolò Leonico Tomeo (1456-1531) was appointed to lecture on the Greek text of Aristotle and Plato at the University of Padua. The philosopher and magician Henricus Cornelius Agrippa von Nettesheim (1486-1535), too, is known to have lectured on the *Symposium*, either at Pavia or Turin, in the second decade of the sixteenth century. Yet it was only in the 1570s that professional philosophers began to teach Plato in the universities with any regularity. Special chairs for the teaching of Platonic philosophy were established in several Italian universities. Most important was the chair set up at Pisa by the Medici grand dukes, who saw themselves as continuing the historic commitment of the Medici to Platonic philosophy. The chair was occupied for half a century by four professors, Francesco de'Vieri the Younger (appointed 1576), Jacopo Mazzoni (1588-97), Carlo Tommasi da Cortona (*c*.1597-1606), and Cosimo Boscagli (d. 1621). Francesco Patrizi da Cherso (1529-97), the greatest expert on Plato of the late Renaissance, was for thirteen years (1578-92) the occupant of a special chair of Platonic philosophy at the University of Ferrara; in 1592 he moved to the Sapienza in Rome where he taught Plato until his death. There was also an unsuccessful attempt to establish a chair in Platonic philosophy at the University of Bologna. All the 'Platonic professors' were serious students of Plato's philosophy who lectured extensively on the text of Plato in Latin, the *Timaeus*, *Republic* and *Phaedo* being special favourites.

6 Plato and the new cosmologies

The introduction of Plato into the philosophy faculties of Italian universities was one of several signals that the hegemony of Aristotelian philosophy was weakening. The Plato chairs were founded in the belief that his philosophy was more compatible with Christianity than Aristotle's; Patrizi promised Pope Gregory XIV that replacing Aristotle with Plato in the universities would purify Catholic theology and put an end to the Protestant schism. Claims such as these revived the interest of philosophers in comparing Plato and Aristotle. There was already by the middle of the sixteenth century a flourishing literature on this topic. A spectrum of opinion emerged, ranging from Francesco Patrizi's view, in his *Discussiones peripateticae (Peripatetic Discussions)* (1581), that Plato was superior at all points to Aristotle, to the opposite view, maintained by Aristotelian scholastics such as Girolamo Borro (one of Galileo's teachers) in his *De peripatetica docendi atque discendi methodo (On the Peripatetic Method of Teaching and Learning)* (1584). Somewhere in the middle were Francesco de'Vieri the Younger and Jacopo Mazzoni, who, following what had by then become the traditional Florentine position, argued for the concord of Plato and Aristotle and for the harmony of both philosophers with Christian theology.

The search for a more adequate philosophical basis for Christian theology led ultimately to the new science and philosophy of the seventeenth century, and Renaissance Platonism had a significant role to play in this development. The 'new cosmologists' of the late sixteenth century frequently invoked Plato as a counter-authority when attacking Aristotelian science - even men such as Telesio, Campanella and Galileo, who otherwise made little use of Platonism in their science. Sometimes Galileo, when trying to conceal the shameful novelty of his science, would pretend to be reviving a lost, pre-Aristotelian cosmology - an apologetic strategy that recalls Ficino's belief in an 'ancient theology'. There were in fact some striking similarities between the new science and Platonic science, the latter reconstructed (sometimes tendentiously) from the *Timaeus* and other dialogues. Already in the 1540s Copernicus had been encouraged by the symbolic role of the sun in Platonic metaphysics (as mediated by Ficino's *De sole*) to embrace the heliocentric hypothesis. Heliocentrism remained linked to Neoplatonism as late as the time of Bruno and Kepler. In the late sixteenth century other elements of Platonic science appealed. Plato was credited with a simplified elemental theory which by excluding quintessence undermined the physical basis of the two-sphere universe. The light-metaphysics of Patrizi and Bruno, an inheritance from Proclus and the pseudo-Dionysius, has been considered a forerunner of Galileo's distinction between primary and secondary qualities. Giordano Bruno's belief in infinite worlds was taken from Proclus via Nicholas of Cusa. Proclus was also an important source for Patrizi's rather different, more mathematical argument for the infinity of the cosmos. The new cosmologists moreover professed to find in the *Timaeus* authority for their non-Aristotelian concepts of gravity, time and space, as well as for the 'mathematization of the cosmos' that begins with the generation of Patrizi and Galileo. Though it was ultimately the new science of Galileo and Newton that put an end to the dominance of Aristotelian science, the 'countercultural' influence of Plato was important in loosening the allegiance of Renaissance natural science to its medieval past.

Pleasure

From Plato and beyond, pleasure has been thought to be a basic, and sometimes the only basic, reason for doing anything. Since there are many forms that pleasure can take and many individual views of what pleasure consists in, much attention has been given to how pleasures may be distinguished, what their motivational and moral significance might be, and whether there may not be some objective determination of them, whether some may be good or bad, or some better as pleasures than others.

But first there is the question of what pleasure is. It has been variously thought to be a state of mind like distress only of the opposite polarity; merely the absence or cessation of or freedom from pain; a kind of quiescence like contentment; or the experiencing of bodily sensations which, unlike sensations of pain, one does not want to stop. We also identify and class together particular sources of pleasure and call them pleasures of the table, company, sex, conversation, solitude, competition, contemplation or athletic pleasures. In this sense there may be some pleasures which we do not enjoy. But most generally pleasure is what we feel and take when we do enjoy something. This raises the questions of what is encompassed by 'something', what it is to enjoy anything, and the extent to which theories of pleasure can accommodate both our passivity and activity in pleasure. The most influential theories have been those of Plato, Aristotle and empiricists such as Hume and Bentham.

1 Logically proper objects of enjoyment

Elizabeth Anscombe observes that there is both enjoyment of substances: activities themselves, or things, or happenings, or existence itself; and enjoyment of facts: that one made the visit, that one is talking to the wittiest person in the room, that the sun is shining again. Both kinds may be illusory, the apparent fact not a fact, the activity not actually occurring, which calls for qualification in terms of what one thinks to be so as possibly opposed to what is so. The significance of these distinctions is that it may be true that I am enjoying what I take to be the fact that I am having a holiday while it is false that I am enjoying the holiday itself; and the first may be true even though I am mistaken in thinking that I am having a holiday: I may be on call and about to be summoned.

This gives us one interpretation of the distinction between true and false pleasures: my holiday would be truly pleasant if it is true both that I am enjoying the holiday and the fact that I am having a holiday and it is true that I am having a holiday. If any one of these is false it might reasonably be thought that my holiday could not be truly pleasant. But this is not the only interpretation of this distinction.

2 Theories of pleasure

Plato thought that pleasure is the replenishment or filling of a natural lack (for example, *Republic* IX) or, better, in a move to include something more active, the perception of the replenishment of a natural lack (*Philebus*). So eating is a pleasure if one is hungry and one is attending to and enjoying eating as satisfying one's hunger. What one enjoys is always some process which one perceives as restoring a deficiency that has occurred and one has become aware of. Pleasure is not caused by these processes or the perception of them; they are the pleasures in question. So according to this theory the proper object of enjoyment is a process which is perceived to restore the body's silence or remove the clamour of the mind.

This raises the question of how natural lacks may be identified. Even if it is true that one lacks what one desires, it does not follow that all lacks so identified are natural. And while this theory may accommodate plausibly bodily desires and pleasures it seems not easily to deal with intellectual ones, though the examples of curiosity and the pleasures of education may lessen these doubts. Posing greater difficulties are the pleasures of anticipation and memory, and aesthetic pleasures. These are undoubtedly pleasures but only in a strained sense do they imply lacks. Plato was aware of these problems, and partly because of them came in the *Philebus* to see that there was no theory that covered all pleasures.

Freud's theory of pleasure can be regarded as a mirror image of Plato's. Both are homoeostatic theories in that pleasure is the return to rest, though Freud sees that not in replenishment but in discharge of affect at the point where the person's interest is invested.

Aristotle in *Nicomachean Ethics* appears to offer two theories: pleasure is the unimpeded activity of a natural

faculty (VII); pleasure completes an activity by supervening upon it ‘as the bloom of youth does on those in the flower of their age’ (X). Whether or not these are two theories, at least they agree in that the proper object of enjoyment is not a process as Plato thought, but an activity. Aristotle’s distinction is that a process is not complete until it reaches its end whereas an activity has no end in this sense and is complete in itself. One cannot enjoy convalescing because one is not yet well, though one can enjoy such health as one has at any one time. As we might say, activities concern our purposes rather than our ends. If we purpose to be calm and reasonable we do not cease our activity because it has been once successful, whereas our end of being in Cambridge in the spring is extinguished once it is achieved. Pleasure is in achievement, completion, perfection, whether the achievement is continuous or episodic.

G.E.L. Owen has argued that there are two theories but they are about different things. In book VII Aristotle is concerned with the objects of enjoyment; in book X he has moved to the question of what enjoying contributes to the enjoyed activity, in the realization, perhaps, of the need to embrace our passivity. He answers that pleasure is a perfection added to an activity which is already complete in itself. It seems on this view, however, that Aristotle has two sometimes incompatible determinations of the proper object of enjoyment: the unimpeded activity itself, perfect as the prime of youth is perfect; and the perfection of that activity, the bloom on the cheek of those in the prime of youth. It is as if one is in the first case enjoying the unimpeded listening to a Schubert sonata and in the second enjoying the perfection of one’s listening. The second may be part of one’s enjoyment of the first but it need not be. Perhaps the solution is that one’s enjoyment enhances one’s listening and the more exquisite one’s enjoyment the more perfect one’s listening. In that case Owen’s two theories do not remain distinct and neither, as a good consequence, does our activity and passivity in pleasure.

Henry Sidgwick in *The Methods of Ethics* written towards the end of the nineteenth century observed that Aristotle’s theory in one form or another was still current. His interpretation of it is that every normal sense perception or rational activity has its corresponding pleasure and that the most perfect, the exercise of an unimpaired capacity on the best object, is the most pleasant. The pleasure follows the activity immediately giving it a kind of finish like the bloom of youth.

Empiricist theories of pleasure have three characteristics: first, pleasures are quantifiable; second, pleasures either are bodily sensations (see Bodily sensations) localized like those that occur when one warms one’s hands before a fire or nonlocalized like the physical wellbeing after exercise, or are qualities or impressions of such sensations; and third, there is an extensional relation between the pleasure and its object which may or may not be a part of its cause. It is a serious question whether any empiricist from Locke and Hume through Bentham and John Stuart Mill to the pioneers in psychological theory are consistent empiricists about pleasure.

Pleasure comes in amounts which can be increased or decreased and calculated or measured and quantitatively compared. Bentham distinguishes five variables which are involved in determining the total amount of pleasure given by a particular experience: intensity, duration, fecundity (possibilities of further pleasures), purity (absence of mixture with pain) and extent. This requires that pleasures be identifiable occurrences like sensations, or an immediately recognizable quality of such occurrences, which have the right kind of properties for quantification.

So pleasures are caused by other occurrences and the relation between the pleasure experienced and the object of it is quite contingent (or extensional). I may be enjoying the wine I am savouring but why I am enjoying it may have nothing to do with the wine itself. I may have been conditioned or otherwise caused to enjoy whatever is put in front of me. Even when the wine itself is the occasion of my enjoyment of it, it could have been otherwise. That is, empiricist theories of pleasure, while being able to accommodate talk of objects of enjoyment, do not determine what those objects are. There are in theory no proper objects and there is no activity in our enjoyment, only process.

3 Morally proper objects of enjoyment

For classical utilitarian and hedonistic theories (see Hedonism; Utilitarianism) the only morally proper object is pleasure and the absence of pain. But such singularity at the highest level requires quotidian diversity. The most common way of dealing with the question of whether some objects of enjoyment are morally better than others is to distinguish between higher and lower pleasures. For example, John Stuart Mill in the second chapter of *Utilitarianism* writes that some kinds of pleasures are more desirable and more valuable than others and so differ

in quality as well as in quantity. 'It is better to be a human being dissatisified than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied.' He follows Plato who says (*Republic* IX) that the greatest pleasures are those associated with the exercise of our highest faculties (reason) and that apart from their intensity mental pleasures are preferable to any amount of physical pleasure.

Clearly this is tendentious for all that it might appeal to us. Those competent to judge between pleasures doubtless must have experience of them but there would appear to be no place for the idea of expertise in comparative judgments of them. A better test would be whether the pursuit of a particular pleasure is self-defeating.

Aristotle's approach looks more promising. Pleasures, being so closely associated with the activities to which they add perfection, can be compared and judged by evaluating the activities themselves, which one does by considering the lives in which they naturally occur. The bad man's pleasures are not the good man's pleasures since the good man chooses not to live the kind of life the bad man enjoys. Julia Annas argues that Aristotle must therefore reject hedonism and any form of utilitarianism that includes hedonism as a part because for him pleasure is not a single end specifiable independently of different chosen activities and the lives they partly constitute. This yields another interpretation of the distinction between true and false pleasures: true pleasures are those of a good life and false pleasures are not. This shifts the question to what a good life is, but that question has a clearer focus.

4 The content of enjoyment

This question does not concern the objects of enjoyment but what it is to enjoy anything. Empiricist theories construe enjoyment as the having of bodily sensations or episodes like sensations: thrills, transports, raptures or convulsions; the list is Gilbert Ryle's. It is Ryle's argument that this construal of pleasure, though natural to the pioneers in psychological theory, is seriously mistaken. Their programme, he believed, was to construct a dynamic theory of human conduct in which such things as wantings and likings are processes, the mental counterparts to the pressures and attractions of mechanical theory. Psychic motions could be calculated if the durations and intensities of pleasures and desires were measurable and construed on the model of the parallelogram of forces.

But, he argues, pleasure or enjoyment are not processes of any sort. My enjoyment of a game, for example, is not some occurrence that accompanies the game itself, that could distract my attention from the game, that can occur by itself without the game, be described as processes are, as fast or slow, as having some location within the body image, as being, indeed, pleasant or not! These absurdities flow from the mistaken thought that the role of the concept of pleasure is the precise counterpart of the concept of pain. Ryle shows that pleasure is not a sensation as pain mostly is and so not an affective process. There are ways of construing pleasure and pain that will keep them as counterparts, but that will succeed only in making both pleasure and pain not sensations themselves but attitudes to sensations; and there are ways of keeping pains as sensations and not attitudes to sensations, but then they would no longer be counterparts of pleasures. Are there sensations of pleasure rather than pleasurable sensations of warmth, touch, motion, and the like? There seem to be some obvious examples but if there are they are hardly representative of everything that we enjoy and we should do better to avoid misleading assimilations entirely.

This returns us to the necessity of thinking of pleasure as something we take, to our being active and not merely passive in enjoyment. The activity need not be vigorous and may be merely the activity of the imagination or of paying attention or of attending finely to what is happening or to what we are engaged in doing. There are resonances here with Aristotle, and Ryle comes close. He speaks of our liking and disliking as special qualities of the interest we have in an activity, and of that interest itself as a special quality of the activity in question.

This does not imply that we do not feel anything when we enjoy something, only that our feeling enjoyment is not usefully interpreted as being something like a bodily sensation, localised or not. Neither does it follow that we cannot compare our pleasures and discuss their merits and demerits, or contrast them with our pains and miseries. We do, but not by counting and calculating. Contemporary calculations of welfare functions have little to do with pleasure as here reviewed. Unless we take pleasure in what we do and experience, we should get none; but if we feel nothing, it is not pleasure that we take.

Plekhanov, Georgii Valentinovich (1857-1918)

Known as 'the Father of Russian Marxism', Plekhanov was the chief popularizer and interpreter of Marxism in Russia in the 1880s. His interest in the philosophical aspects of Marxism made him influential outside as well as inside Russia. He was a prolific writer, and dealt with several aspects of Marxist thought.

Plekhanov was an important figure in the Russian revolutionary movement. He was a founder member of the Russian Social Democratic Party, and a leading figure in its Menshevik wing after it split into Bolsheviks and Mensheviks in 1903. As a politician, Plekhanov was constantly involved in polemics with political and ideological opponents. Most of his theoretical works are to some degree polemical, and it was the conflicts among Russian revolutionary groups that shaped Plekhanov's interpretation of Marx's thought.

A basic feature of this interpretation was that Russia's historical development was like that of Western European countries, and would pass through a capitalist phase before progressing to socialism. Accordingly, Plekhanov gave prominence to those of Marx's writings which could be presented in a deterministic way. Plekhanov insisted that Marxism was a materialist doctrine (as opposed to an idealist one) and as such recognized the primacy of matter in all spheres of existence.

Plekhanov was in many ways an innovator, being the writer who first coined the term 'dialectical materialism', and who drew attention to the Hegelian origins of Marx's system. His writings were quickly translated into several European languages. His interpretation of Marxism was much admired by Lenin, and was to form the basis of the official ideology of the Soviet Union. The conception of Marxism that Plekhanov propounded continues to exercise a profound influence on conceptions of Marxism throughout the world.

1 Life

Georgii Valentinovich Plekhanov was born in 1857 in the village of Gudalovka in the Tambov province in central Russia. His family belonged to the minor land-owning nobility. From 1868 Plekhanov attended the military academy in Voronezh, and with the intention of following a military career, in 1874 he enrolled in the St Petersburg Mining Institute.

It was while studying in St Petersburg that Plekhanov first came into contact with representatives of the Russian revolutionary movement, including S.M. Stepniak-Kravchinskii, P.B. Akselrod and L.G. Deich, who belonged to the group 'Land and Liberty'.

The members of Land and Liberty held that the function of revolutionaries was to articulate and strive to achieve the concrete aspirations of the common people. They believed that they should avoid projecting onto the people the desires of the educated intelligentsia. The term to describe a revolutionary of this kind was 'Narodnik' (Populist). In the 1870s Russian revolutionaries inspired by Bakunin, Lavrov or Marx all considered themselves to be 'Narodniki'. The slogan which Plekhanov held best to embody the Narodnik principle was: 'The liberation of the workers is the task of the workers themselves'. These were the opening words of the First International's constitution, and had been written by Marx.

In the 1870s there were three main currents of opinion in the Russian revolutionary movement: (1) the followers of Bakunin, who believed that life in the village communities had made the Russian peasants natural communists, and that it only required agitation by the revolutionaries to stir them into rebellion against the state; (2) the followers of Lavrov did not agree that Russian peasants were socialists by nature, and thought that they ought to be educated by the intelligentsia, to bring them up to the same level of consciousness as the intellectual elite in society; (3) the disciples of Tkachëv, by way of contrast, were of the opinion that there was no need to prepare the common people in any way for revolution; it was simply a matter of seizing control of the state by a well-organized conspiracy, and then using the state machinery to change society in a way beneficial to the common people.

At the start of his revolutionary career Plekhanov became a Bakuninist. As such, he was hostile to the state, and thought that the only worthwhile change would be a social one that would come from below. Like most Russian revolutionaries of the period Plekhanov considered political activity a waste of effort. He believed that Marx was in agreement with Bakunin on this point, since he understood Marx to have argued that the economic and social

base brought about changes in the political superstructure and not the other way round.

In December 1876 Plekhanov organized and took part in Russia's first revolutionary demonstration, held at the Kazan Cathedral in St Petersburg. Several participants were arrested, but Plekhanov himself escaped, and began his life as a professional revolutionary. The following year he went abroad, spending several months in Paris, where he met Lavrov, and in Berlin, where he made contact with the German Social Democrats.

On his return to Russia in 1877 Plekhanov conducted revolutionary agitation in Saratov, recruiting local workers and students to Land and Liberty. After a brush with the police, he returned to the capital and joined the editorial board of the journal *Zemlia i volia (Land and Liberty)*, to which he contributed the article 'The Law of the Economic Development of Society and the Tasks of Socialism in Russia'. In it he argued that since the communal system of agriculture was still prevalent in Russia, socialism might be established there directly, without the necessity for capitalist development to run its course.

Consistent with the belief that social change came from the economic base, Land and Liberty maintained that terrorism was incapable of bringing about social transformation, but that it might be used as a reprisal against the authorities. This position began to change following the wave of popular sympathy aroused by the trial and acquittal of Vera Zasulich in 1878 for her assassination attempt on the governor of St Petersburg. This gave an impetus to the use of terror as a political weapon. In 1879 Land and Liberty split to give rise to two new organizations: 'People's Will', which favoured the use of terror, and 'Black Repartition' led by Plekhanov, which adhered to Narodnik principles and eschewed any type of political action.

In order to avoid arrest, Plekhanov left Russia in 1880, expecting to be able to return shortly. In fact he remained in exile for thirty-seven years, until the Revolution of 1917. In Paris Plekhanov translated 'The Communist Manifesto' into Russian as one of a series of socialist works to be published by himself in association with Lavrov. Marx and Engels supplied a foreword in which they admitted the possibility that the peasant commune might be the basis for communist development in Russia. By 1881, however, Plekhanov had come to the conclusion that Russia had now embarked on the path of capitalist development, and that all other paths were now closed to it. Plekhanov considered his change of view to be an adoption of Marxism, but it was a viewpoint out of step with Marx's own thinking.

2 Life (cont.)

Plekhanov's Black Repartition group was overshadowed by People's Will, especially after the latter group organized the assassination of Alexander II in 1881. In 1883 Plekhanov launched a new group, the 'Liberation of Labour', which, he claimed, espoused the doctrines of Marx and Engels. He elaborated the new group's standpoint in a work entitled *Sotsializm i politicheskaia bor'ba (Socialism and the Political Struggle)*, published in October 1883. The book admitted that Black Repartition had been wrong to reject political action, but condemned People's Will for having gone too far in the opposite direction, and adopting the Blanquist tactics of Tkachëv. The Liberation of Labour, Plekhanov argued, was the optimum synthesis of the two extremes represented by Black Repartition and People's Will.

Lev Tikhomirov replied to Plekhanov's book on behalf of People's Will, pointing out that his organization's standpoint and tactics had been grossly misrepresented by Plekhanov. In response Plekhanov published the book *Nashi raznoglasiia (Our Differences)* (1884). This argued that the adherents of People's Will subscribed to a quasi-Slavophile notion that Russian development was unlike that of Western Europe, and that Russia could avoid a capitalist stage. This quasi-Slavophile doctrine Plekhanov dubbed 'Narodism', changing completely the usage of the term. He traced the origins of this Narodism to Herzen and Chernyshevskii, claiming that everyone who believed that Russia might avoid capitalist development belonged to the Narodnik current. This presentation of Russian intellectual history was hotly contested at the time, especially by those Plekhanov classed as Narodniks, but it later gained wide acceptance.

In the late 1880s Plekhanov studied Hegel's philosophy, and made use of this in his polemical essay against Tikhomirov, 'Novyi zashchitnik samoderzhaviia' (A New Champion of Autocracy) (1889) and the article 'Zu Hegel's sechzigstena' (On the Sixtieth Anniversary of Hegel's Death) published in German in 1891. In this latter work Plekhanov first gave currency to the term 'dialectical materialism' to characterize Marx's philosophical method. Plekhanov elaborated the concept of 'dialectical materialism' at length in *K voprosu o razvitii*

monisticheskogo vzgliada na istoriiu (The Development of the Monist View of History) (1895), in which he drew on his studies of classical German Philosophy and French materialism of the eighteenth century. Plekhanov believed that Marx's dialectical materialism was a synthesis of elements taken from both of these schools - metaphysical materialism and dialectical idealism (see Dialectical materialism §§1-2).

In this work Plekhanov also accused his Narodnik opponents of 'subjectivism', which he traced back to Lavrov's *Istoricheskie pis'ma (Historical Letters)* (1870). He tried to find writings by Marx which would also condemn 'subjectivism', and interpreted Marx's contributions to *The Holy Family* (1845) in this light.

At the turn of the century Plekhanov and the other members of Liberation of Labour became involved in a polemic with a new generation of social democrats in Russia, who believed that the efforts of revolutionaries should be devoted less to abstract theorizing and more to catering for the concrete needs of the workers' movement. Plekhanov labelled social democrats of this type 'Economists', and enlisted Lenin's help in a campaign to discredit them.

At the Second Congress of the Russian Social Democratic Labour Party in 1903 Plekhanov supported Lenin and the Bolsheviks against the Menshevik wing. By the end of the year, however, he had changed affiliations and sided with the Mensheviks. In later years he was constantly to vacillate between the two wings of the party. In the years following the 1905 Revolution, when a 'Liquidationist' current appeared within Menshevism arguing that in the new conditions there was no longer any need for an underground party organization, Plekhanov joined with the Bolsheviks in denouncing this as heresy. Between 1907 and 1910 he also cooperated with Lenin in a campaign against the current of Russian socialist philosophy represented by Aleksandr Bogdanov, his main publication in this respect being the series of open letters with the general title 'Materialismus Militans'.

Plekhanov's accord with the Bolsheviks was destroyed after the outbreak of the First World War. Whereas the left wing of Russian Social Democracy condemned the war, Plekhanov became an ardent advocate of an Entente victory over the Germans. He maintained this position even after he returned to Petrograd in April 1917, contributing pro-war articles to the Menshevik newspaper *Edinstvo (Unity)*.

The main theoretical work written by Plekhanov after *The Development of the Monist View of History* was *Osnovnye voprosy marksizma (Fundamental Questions of Marxism)*, which appeared in 1908. This, however, mainly restated ideas which had been formulated in earlier writings. In 1909 the Moscow publishing house Mir commissioned Plekhanov to write a history of Russian social thought in the nineteenth century. This project became Plekhanov's main literary endeavour for the rest of his life. When he died, on 30 May 1918, however, only three out of a projected seven volumes had been completed.

3 Plekhanov's Marxism

Plekhanov became an extremely influential interpreter of Marx's ideas because he wrote at an early and crucial stage in their propagation. He was attracted to the scheme of historical determinism associated with Marx's name in the early 1880s when both Marx and Engels were still alive, and when relatively few of Marx's works had been published (see Marx, K. §8).

Moreover, Marx died in 1883 without leaving behind him a completed system. Originally he had intended to deduce the categories of political economy in the same manner as Hegel had deduced the categories of philosophy, and in doing so show that the world market was contained in the concept of capital. The reasoning was that when capital - externalized human social nature - became a world system and reached its point of culmination, it would collapse and give way to socialism. By the 1870s, however, Marx had come to realize that the circulation and reproduction of capital would not of itself erode existing economic and social structures. In studying the economic processes in Russia he formed the opinion that capitalist development might be forestalled there and socialism established on the basis of the peasant commune.

Although Plekhanov was well aware of Marx's views on the possibilities of Russian development, he did not try to amplify or propagate them. Instead, he attributed to Marx the doctrine that all countries passed through the same historical stages, and that capitalist development would necessarily take place in Russia.

Plekhanov was not a dispassionate student of Marx's ideas. He approached them as a polemicist, emphasizing some aspects of Marx's work and ignoring others as the stance he took in a given polemic required. The kind of

philosophical questions Plekhanov took up were invariably those which had a bearing on the factional disputes in which he was involved.

The dispute on the efficacy of political action impelled Plekhanov to examine the relationship between historical determinism and the freedom of human action. This was to be a recurrent theme in his writings. Plekhanov argued that freedom and necessity were interconnected ’dialectically’, that they formed the kind of unity, a freedom-necessity, that Schelling had proposed in his philosophy of identity (see Schelling, F.W.J. §2). He also compared the interrelationship between freedom and necessity to Spinoza’s Substance, which led him to define Marxism as a variety of Spinoza’s philosophy. Plekhanov also claimed that the freedom-necessity relationship had been satisfactorily formulated by Hegel when he stated that freedom implied knowledge of the laws of nature and submission to them. The primacy given to necessity in this formulation allowed Plekhanov to assert that the course of history was determined, not by human volition, but by the material productive forces.

In keeping with this conception of human history Plekhanov repeatedly stressed that human nature was not a constant, but an eternally changing product of the historical process. He claimed that Schelling, Hegel and Marx had all subscribed to this view. He was only able to find a single (ambiguous) passage in Marx to support this contention.

Plekhanov emphasized that ’dialectics’ as he understood it differed substantially from simple evolution. He quoted Hegel to the effect that in both nature and human history transformations of quantitative into qualitative differences took place not gradually, but by ’leaps’. These leaps Plekhanov considered to be characteristic of the dialectical method that Marx and Engels had taken over from Hegel. In fact, in the passage cited Hegel was concerned to show that creation and destruction ought to be accounted for in terms of the development of the Concept, and that in changes from quantity to quality and *vice versa* the element of unpredictability - the ’cunning of the Concept’ - operated at even the most basic levels of existence. Hegel’s actual argument was lost on Plekhanov, who had only a superficial understanding of Hegel’s system.

Plekhanov drew a firm distinction between idealist and materialist philosophies, asserting that only the latter were compatible with Marxism. He rejected any suggestion that human knowledge of the material world was conditioned in some way by the constitution of the human mind. He insisted that things-in-themselves were material objects and these directly or indirectly acted on the human senses to produce sensations. Materialism, as Plekhanov understood it, recognized the material nature of things, while idealism denied this materiality. This was an argument taken up by Lenin in his book *Materializm i ėmpiriokrititzism (Materialism and Empiriocriticism)* (1909) (see Lenin, V.I. §1). The implication was that Marx’s philosophical conceptions were derived from the eighteenth-century French materialist tradition rather than from the line of inquiry that Kant had initiated and to which Fichte, Schelling and Hegel had, in their turn, contributed.

4 Significance and evaluation of Plekhanov’s work

Plekhanov was able to achieve prominence as an authority on the philosophical foundations of Marx’s thought because by the end of the nineteenth century knowledge of the intellectual context in which Marx had grown up had become extremely rare. As a result, his standing was high not only in Russia, but also throughout Europe. It was largely in the interpretation given to them by Plekhanov that Marx’s ideas were received by the wider public. This is indicated by the fact that Plekhanov’s term ’dialectical materialism’ as a synonym for ’Marxism’ gained general currency.

Dialectical materialism, as Plekhanov had elaborated it, formed the philosophical foundation for the official ideology of the Soviet state. In this form it was widely propagated throughout the world, and was the presentation in which most people were introduced to Marx’s thought. Even the influential Marxist philosopher Georg Lukács took Plekhanov’s interpretation of Marxism as the starting point for his own conception of Marx’s ideas. Lukács regarded Plekhanov and Engels as commentators on Marx of approximately equally high stature.

Plekhanov came to Marx’s system when that system was incomplete and was in the process of modification by its author. It therefore lacked an obvious internal cohesion. Plekhanov exacerbated this situation by preserving the historical determinist aspect which Marx had rejected, and refusing to recognize, as Marx had done, human social nature as the driving force behind the historical process. As a result, Plekhanov propounded a ’Marxism’ that was internally inconsistent and contained the almost mystical implication that somehow ’matter’ would, in the course

of human history, create a socialist society by 'leaps'.

Moreover, Plekhanov's insistence for polemical reasons on interpreting Marx's disagreements with the Bauer brothers in 1844-5 as a campaign against 'subjectivism' gave a misleading impression of the character of Marx's system and how it had emerged. Marx was in fact concerned to combat the common perception that philosophical abstractions had an existence apart from the concrete material they generalized. This was the sense in which he considered himself a 'materialist'. The attempt to eliminate abstractions and other forms of 'reflection' linked Marx to the main current of German philosophy. Plekhanov classed the latter as 'idealist' and would not countenance any debt by Marx to it.

The polemical tactic of assigning all previous Russian socialist currents to the category of Narodism distorted the intellectual history of Russia. It gave the impression that Narodism and Marxism were two distinct phases in the development of Russian socialist thought, and that Narodism was characterized by 'subjectivism', a Slavophile belief in Russia's uniqueness, and a conviction that capitalism could not take root in Russia. Narodism in this sense was a creation of Plekhanov's, but because it formed an integral part of Soviet ideology, it was incorporated into Soviet historical writing.

Plotinus (AD 204/5-70)

Plotinus was the founder of Neoplatonism, the dominant philosophical movement of the Graeco-Roman world in late antiquity, and the most significant thinker of the movement. He is sometimes described as the last great pagan philosopher.His writings, the so called Enneads, are preserved as whole. While an earnest follower of Plato, he reveals other philosophical influences as well, in particular those of Aristotle and Stoicism. Plotinus developed a metaphysics of intelligible causes of the sensible world and the human soul. The ultimate cause of everything is 'the One' or 'the Good'. It is absolutely simple and cannot be grasped by thought or given any positive determination. The One has as its external act the universal mind or 'Intellect'. The Intellect's thoughts are the Platonic Forms, the eternal and unchanging paradigms of which sensible things are imperfect images. This thinking of the forms is Intellect's internal activity. Its external act is a level of cosmic soul, which produces the sensible realm and gives life to the embodied organisms in it. Soul is thus the lowest intelligible cause that immediately is immediately in contact with the sensible realm. Plotinus, however, insists that the soul retains its intelligible character such as nonspatiality and unchangeability through its dealings with the sensible. Thus he is an ardent soul-body dualist. Human beings stand on the border between the realms: through their bodily life they belong to the sensible, but the human soul has its roots in the intelligible realm. Plotinus sees philosophy as the vehicle of the soul's return to its intelligible roots. While standing firmly in the tradition of Greek rationalism and being a philosopher of unusual abilities himself, Plotinus shares some of the spirit of the religious salvation movements characteristic of his epoch.

1 Life and writings

We possess a fairly reliable account of Plotinus' life and writings by Porphyry, his student and editor. Porphyry composed a biography, *On the Life of Plotinus and the Order of his Books*, which prefaced his posthumous edition of Plotinus' writings. At the age of twenty eight Plotinus began his philosophical studies in Alexandria under a certain Ammonius (often called Ammonius Saccas, and not to be confused with Ammonius the teacher of Plutarch of Chaeronea (§1) or with Ammonius, son of Hermeas) and studied with him for several years. After making a futile attempt at a journey to the East in order to acquaint himself with the philosophy of Persia and India, he settled in Rome at the age of forty. He established a school in Rome and stayed there except during his final illness.

The extant corpus of Plotinus' writings is one of the largest we have of any ancient philosopher, and we probably possess everything he wrote. His works are treatises, written in Greek, that grew out of discussions in his school, and vary greatly in length and scope. Porphyry arranged the treatises according to subject matter into six 'enneads' - six sets of nine treatises. In order to arrive at this division he had to split some treatises. Conventionally, references to the *Enneads* are often given only in numbers: 'V 3(49).2, 14-16', for instance, means '5th Ennead, 3rd treatise (which is number 49 on Porphyry's chronological list of Plotinus' writings), chapter 2, lines 14 to 16'.

2 General characteristics

Plotinus' thought grows out of a tradition of so-called Middle Platonism (see Platonism, Early and Middle), which developed during the first two centuries AD. The Middle Platonists interpreted Plato dogmatically: that is, unlike the Academic sceptics, they took Plato to hold definite views. Their interests lie primarily in metaphysics and psychology, broadly understood. Even if they show obvious influence from other schools of thought - many Aristotelian and Stoic notions had become a part of the language of philosophy itself - Middle Platonists believe that the fundamental philosophical truths are to be found in Plato. Plotinus shares these general characteristics.

It is sometimes said that Plotinus is a system builder who never reveals his whole system in an organized way, and that the system must be inferred from bits and pieces here and there in his writings. Another common dictum is that every one of his treatises presupposes all the rest and the whole system. There is something to these claims. However, even if behind Plotinus' writings there lies a more organized comprehensive view than meets the eye, his mind is not that of the rigid system builder. His philosophical genius rather consists in the exceptional sensitivity and depth of thought with which he addresses difficulties inherent in the Platonic tradition.

3 The One and the hierarchy of principles

Plotinus works with a fundamental dichotomy between the intelligible (*to noēton*) and the sensible (*to aisthēton*). The intelligible world is the realm of the real (in the sense of existing independently, being by virtue of itself), and it is unchanging and non-spatial. The sensible world, by contrast, is an unreal, changeable image of the intelligible, expressed in spatial extension. Within both these realms there are further divisions, so that the result is a hierarchical ontology. At the apex of the hierarchy is the One (also referred to as the Good), then, in descending order, are Intellect and Soul (see Nous; Psychē). These three levels, the One, Intellect and Soul, are often called *hypostases* and their names are customarily capitalized. Particular souls - of people, animals and the soul of the sensible world itself - also belong to the intelligible order but are in close contact with the sensible realm. The hierarchy continues in the sensible world, where organisms, forms in matter (that is, sensible qualities), inanimate bodies and matter constitute the main stages. As is evident from the non-spatial nature of the intelligible world, such terms as 'hierarchy', 'above' and 'below' in the present context are not to be understood spatially but as indicating ontological priority.

The One, Intellect, Soul, and, with certain qualifications to be explained below, matter too, are explanatory postulates of the kind the Greek philosophers called principles (*archai*) (see Archē). Plotinus takes a strong realist position with regard to his principles: not only do they exist, they are more real, exist in some fuller sense, than that which they were meant to explain. Inorganic bodies, organisms and their functions, and human consciousness are phenomena to be accounted for in terms of the principles.

Considerations such as the following help explain the plurality of stages in the Plotinian hierarchy. Once a distinction has been made between what is to be accounted for and a principle that explains it, questions may arise about the principle itself: the principle itself may turn out to have features that stand in need of an explanation. A further principle must then be assumed to account for the first one. The process of seeking further principles continues until a principle that needs no further explanation is reached, a principle about which no further questions can be asked. For Plotinus this ultimate principle is the One.

Plotinus generally holds that the principles themselves must have the features they explain. For instance Soul, which is the principle of life, is itself alive. Moreover, the principles ideally have these features in such a way that it is pointless to ask why they have them. The principle possesses in and of itself what other things possess as a derived and contingent feature and hence one that requires explanation. Plotinus frequently expresses this by saying of a principle that it is such and such in itself (*en heautōi*), whereas other things have the same feature as in another (*en allōi*).

Unity is a central concept in Plotinus' doctrine: each stage of the hierarchy has a characteristic kind of unity, with the One as the absolutely simple ultimate principle which is the cause of all other unity that there is, and thereby, the cause of everything else whatsoever. To be is to be one thing, to be unified, and the more unified something is the more of a being it is. The most striking feature of the world of everyday experience is in fact the unity of it as a whole and of individual objects, especially living things, in it. The organization, regularity and beauty that are evident in the world of everyday experience, all of which may be said to express its unity, cannot be explained in terms of its constituent parts. The latter are what is unified and their unity is an imposed feature which must come from elsewhere. The unity revealed in the sensible world is in Plotinus' view far from perfect but it gives the sensible world the reality it has. The same may be said of our experiences of ourselves: introspection will show that the human soul has a more perfect kind of unity than anything pertaining to the body, although even the soul does not have unity of itself (IV 2(4).2; IV 7(2).6-7). Thus, the world of everyday experience, both the external world and our mental life, point beyond themselves to a higher level of reality which is its principle.

This process of going upwards from everyday phenomena obviously draws on Plato's dialectic as described for instance in the *Symposium* and the *Republic*. There are many instances of such a procedure in the *Enneads*, the most famous being Plotinus' first treatise, *On Beauty* (I.6911)), where he builds on Diotima's speech in the *Symposium*. This treatise has been influential in art, especially during the Renaissance. The ascent from the beauty of corporeal things to the Beautiful itself is, as one would expect, interpreted in terms of the Plotinian hierarchy and general doctrine of intellectual ascent (see §6). There is a noteworthy deviation from Plato's views of the arts as expressed in the *Republic* in that for Plotinus art does not imitate nature but operates parallel with nature (I 6.3; V 8(31).1). Thus, the artist uses the intelligible world directly and gives it an expression in the sensible world.

Ignoring the intermediate stages for the moment, the self-sufficiency of the principles with regard to the features they explain, together with the claim that whatever else there is presupposes unity, leads to the highest principle, the One, which is both absolutely simple and unique (V 4(7).1). The doctrine of the One, even if adumbrated by the tradition before Plotinus, is probably his most significant innovation. Some of his Middle Platonist predecessors believed in a simple first principle, but like Aristotle they thought that this simple principle was an intellect of some sort. In Plotinus' view, by contrast, Intellect involves plurality: there is plurality in thought because there is at least a conceptual distinction between the thought and its object, and what is thought is in any case varied (see, for example, V 3(49).10).

The One is unique and involves no variation or limitation. From this it follows that the One cannot be given any positive characterization. It cannot be grasped by thought or known in its true nature since any thought of it distorts in so far as the thought is bound to be composite (V 5(32).6; VI 9(9).4). It would even be inappropriate to say of the One that it is, or that it is one inasmuch as such expressions indicate something unified rather than the absolutely simple nature that gives unity to whatever is unified (VI 9.5). Nevertheless, it is possible to approach the One and even become one with it in a kind of non-cognitive union, a 'vision' which defies all description (VI 9.8-11). It is as a result of this doctrine of a union with the ultimate principle, a union which transcends conceptualization, that Plotinus has been called a mystic. Without wishing to deny the significance of this union with the One, it must be said that it does not play a major role in his writings. In spite of the fact that the One is ineffable, Plotinus manages to say a great deal about it. This is however not a real inconsistency: the ineffability of the One is the thesis that one cannot predicate anything of it since any predication would imply the One's composition. This does not mean one cannot talk about its relations to other things and in general about its role in the ontology.

Even if there are precedents in Plotinus' tradition for a supreme formal principle, most of his predecessors would postulate in addition other ultimate principles. In Plotinus everything derives from the One, even if the lower levels in the hierarchy function in fact as principles of multiplicity. In this sense Plotinus is an ardent monist.

4 Intellect, Soul and the sensible world

The divine Intellect, the stage after the One, is also the realm of the (Platonic) Forms and of the real or primary being. The identification of the realm of the Forms with primary being is straightforward: by definition each Form is eminently and of itself that which it causes in others. But this primary being is also the universal Intellect: the Forms exist as the thoughts of Intellect, whose thinking of the Forms is described as self-thought, and its knowledge of them as a kind of self-knowledge (see especiallyV 5, V 8(31) and V 3). Of several arguments Plotinus advances for the claim that the Forms are internal to the Intellect, the philosophically most interesting one is an argument to the effect that if the Forms are outside the Intellect, its knowledge of them must be acquired; but the Forms are the standards of judgment and if the Intellect does not possess these standards previously it will lack the necessary means of recognizing the impression of each Form for what it is. So, if the Intellect does not essentially contain the Forms as its thoughts, its knowledge becomes problematic: an unacceptable conclusion since it is agreed that the universal divine Intellect has supreme knowledge. Plotinus' identification of primary being with a divine Intellect implies that there is a level of reality where knowledge and being, epistemology and ontology, coincide. This Plotinus takes to be a necessary condition of the possibility of knowledge.

As mentioned above, Intellect is characterized by a greater unity than the sensible world. This is first of all brought out by the fact that Intellect is non-spatial and non-temporal and hence free from the dispersion that has to do with space and time. Second, the part-whole relations in Intellect are such that not only does the whole, which is more than the sum of its parts, contain its parts, the whole is also implicit in each of the parts (see, for example, VI 2(43).20). Third, there is no real distinction between subject and attribute at the level of Intellect. Instead Plotinus posits intellectual substance and its activity (*energeia*), which is identical with the substance. Much of this doctrine about the relationships between items on the level of Intellect is founded on interpretations and suggestions in Plato's late dialogues. Plotinus takes the five 'greatest kinds' of the *Sophist* - being, sameness, difference, motion and rest - as the highest genera of his ontology. Each of these is distinct, but nevertheless presupposes and is interwoven with all the others. As a whole they constitute the Intellect or the intelligible substance. Particular Forms are generated from them.

The integrity of Intellect implies that Intellect's thought is different from ordinary discursive thought: Intellect

grasps its objects and all their relations in an atemporal intuition of the whole, employing neither inferences nor words; the vehicles of its thought are the very things themselves, the prototypes and causes of which all other things, whether natural phenomena or lower modes of human thought, are inferior manifestations.

Soul is the level below Intellect. On account of the multiplicity of its functions, Soul is in some ways the most complex of the Plotinian *hypostases* and conceptually the least unified one. The historical sources of Plotinus' notion of Soul are primarily Plato's dialogues, above all the *Timaeus*, but Plotinus' psychology also reveals strong Aristotelian and Stoic influences.

Plotinus makes certain distinctions within the psychic realm. There is the *hypostasis* Soul, which remains in the intelligible realm, and there are the World-Soul and the souls of individuals, where the latter two are on the same level (IV 3(27).1-8). Within the two latter types of soul, Plotinus further distinguishes between a higher and a lower soul, corresponding to a distinction between soul which operates directly through a body and soul which does not (this distinction coincides with the distinction between rational and non-rational soul). Soul is the intelligible level which is responsible for the sensible world. The lower soul, sometimes referred to as nature (*physis*), produces matter itself, inorganic bodies and ordinary living things, including the sensible cosmos itself, which according Plotinus is a supreme organism (IV 4(28).33).

Plotinus holds that all souls are one, that all souls are identical with the *hypostasis* Soul (and by implication with one another). The Neoplatonists after Porphyry rejected this doctrine but Plotinus maintains it consistently and attaches considerable importance to it (IV 9(8); VI 4 (22).4; IV 3.1-8). Such a doctrine seems to be implied by the combination of two Plotinian doctrines that we have just mentioned: the Soul's membership of the intelligible realm (or the realm of real being) and the integrity of that realm.

It has been mentioned that Intellect is outside space and time. In *On Eternity and Time*, Plotinus states his views on time. The treatise contains interesting and powerful criticisms of the views of Aristotle, the Stoics and the Epicureans. As is often the case, Plotinus' own views are a development of Plato's *Timaeus*. He defines eternity as 'the life which belongs to that which exists and is in being, all together and full, completely without extension or interval' (III 7 (45). 3, 36-8) and time as 'the life of soul in the movement of passage from one mode of life to another' (III 7.11, 43-5). Thus, time comes in at the level of Soul as the 'image of eternity'. This means that Soul, in producing the sensible world, unfolds in successive stages what at the level above is present all together and without temporal interval.

Certain difficulties arise precisely on account of Soul's close relationship with the sensible. In the first place, how can Soul cause, administer and ensoul the extended sensible world without thereby coming to share in its extended nature? How can Soul operate in different parts of extension without being divisible into spatially distinct parts itself? If it is divided, its intelligible status will be lost or at least seriously threatened. This difficulty is increased by the fact that according to common and deeply ingrained opinion Soul is present in the bodies it ensouls. Plotinus was deeply disturbed by these and other puzzles having to do with Soul's relationship with the sensible realm as is demonstrated by the fact that he returns to the questions repeatedly. Despite brave attempts, it is questionable whether he succeeds in giving a satisfactory account of them.

One solution Plotinus frequently suggests and argues for, mainly from facts about the unity of consciousness in sensation, is that the Soul is present as a whole at every point of the body it ensouls. In this way it can be at different places without being divided. Its being present as a whole in different parts of space shows its different ontological status from that of bodies which have numerically distinct spatial parts (see, for example, IV 2 (4).2). Another account, however, presents Soul as not present in body at all, but rather the reverse - body as present in Soul. Body is in Soul in the same way that bodies may be said to be in light or in heat: they thereby become illuminated or warm without (in Plotinus' view) dividing or affecting the source of light or heat in any way. Similarly, bodies become ensouled, alive, by virtue of the presence of Soul. These ideas are explored in VI 4 (22) and 5 (23) (constituting a single treatise), which contain what is perhaps Plotinus' subtlest account of the relation between the sensible and the intelligible. Here he attempts to explain the apparent presence of the intelligible in the sensible in terms of its having effects in the sensible without being locally present there.

At the bottom of the Plotinian hierarchy lies matter. Plotinian matter is like the One in that it permits no positive characterization, but this is for exactly the opposite reasons. The One is, one might say, so full, so perfect, that it

eludes any positive description. Matter, on the contrary, is such on account of its utter privation, or lack of being: it is sheer potentiality. Matter in Plotinus' system is the receptacle of immanent bodily forms, such as colours, shapes and sizes. Physical objects, bodies, are composites of matter and such immanent forms (VI 3(44).15). Matter itself is not subject to change but underlies change: as Forms come and go matter remains unaffected (III 6(26)). It is as such imperceptible, but reason convinces us of its existence as a purely negatively characterized substrate of forms. As what underlies the forms of bodies, it might be tempting to identify matter with space or with mass. Plotinus nevertheless rejects this, maintaining that the three-dimensionality of space presupposes local determination and that mass contains form, whereas matter is totally indeterminate and without form (II 4(12).8-12). Nevertheless, matter is the principle of spatial extension in that the dispersion characteristic of space is due to matter. Matter is an explanatory principle in the sense that it is necessary for explaining plurality, although it is not a principle of being in Plotinus' sense.

In the treatise I 8(51), Plotinus discusses at length questions concerning evil, a topic also brought up in many other treatises. The intelligible world is perfect and totally self-sufficient. While the sensible world is not, it is a reflection of the former and contains nothing which does not have its origins there. It is therefore puzzling how evil can arise. Plotinus argues that evil as such does exist and he identifies it with matter, understood as lack of all form, or non-being. This is absolute evil. Other things are evil in a relative way in so far as they have a share in matter.

5 Causation and critique of Aristotle

In the preceding account of the Plotinian principles mention has been made of the relationships between the *hypostases*. It remains, however, to address this topic generally. Plotinus inherits from Plato two ways of describing the relationship: the language of participation and the language of model (*paradeigma*), imitation and image (*eikōn*, *eidōlon*). A lower level participates in a higher one, and thereby comes to have the character of the latter, or it imitates the higher to the same effect. Both these ways of describing the relation see it from the viewpoint of the effect. Plotinus and the other Neoplatonists have in addition ways of describing the relation in terms of the causal agency of the higher level. This is what is commonly called emanation, although Plotinus' language is quite varied here. He often simply uses expressions such as 'to make' (*poiein*) and 'to proceed' (*proienai*) for the activity of a higher realm. He also frequently uses the analogies of the sun and the light it radiates, fire and heat and the like, to illustrate how a higher *hypostasis* generates a lower, and occasionally he uses the metaphors originating in language about water (for example, 'to flow out'). He is well aware of the fact that these are metaphors that must not be understood too literally. The term 'emanation' may mislead in so far as it suggests that the cause spreads itself out. Plotinus, on the contrary, consistently maintains that the cause always remains unaffected and loses nothing by giving away.

In Plotinus there is sometimes an explicit and often an implicit distinction drawn between 'internal' and 'external activity' (*energeia*) (see, for example, V 3.12; V 4(7).2). This distinction runs through every Plotinian cause down to Soul and is crucial for an understanding of causation in the system. Keeping in mind what has been said about the identity of a substance with its activity, the internal activity will be the same as the thing itself. In terms of the light analogy the internal act is analogous to whatever the source of light, considered in itself and as a source of light, is doing. The external act is this same entity considered as operating in something else, causing the brightness on the wall for instance.

The matter is more complicated still: there is not only a process from the cause, but also a reversion (*epistrophē*) of the produced towards its source without which the external act is incomplete. Since there is no pre-existent material principle, a recipient of form, what becomes informed must come from the informing cause. Thus, the outgoing aspect of a given level in the hierarchy functions as a material principle for the level below, the returning aspect as the informing of that material principle. Thus, reversion is equivalent to imitation. The product is an image or expression of the original, an effect, which nevertheless is not cut off from its cause, because the effect depends on the activity of the cause.

All activity except the internal activity of the One is a form of thinking or contemplation (*theōria*) (III 8(30)). (Even the One's activity appears to be mental activity of a sort, although it is not 'thinking' (see, for example, V 4(7).2; VI 8(39).16.) This holds even of the activity of the lower phase of the World Soul, nature, which creates the sensible forms in matter: all action (*praxis*) and production (*poiēsis*) have contemplation as their goal;

production is the result of weak or imperfect thinking. We may visualize the system as a hierarchy where each stratum has an external activity, which in an attempt to grasp in thought its source creates an image of it, revealing it as more 'unfolded', less unified. So in a way the same items exist on every level: the One is everything there is, but in such a unified form that no distinctions are to be found. Likewise, Intellect and Soul, and finally the physical world contain everything there is. Only at the very lowest levels, that of matter and immanent sensible forms, is there no generation, which is another way of saying that we have reached the bottom.

Plotinus wrote some treatises on technical philosophical subjects such as potentiality and actuality (II 5(25)) and substance and quality (II 6(17)). The treatise on matter (II 4 (12)) may also be said to belong to this group. The most extensive among such treatises, however, is VI 1(42)-3(44), which Porphyry gave the title 'On the Kinds of Being'. In VI 1 Plotinus critically discusses Aristotle's *Categories* (see Aristotle §7; Categories §1), which he takes to be about the genera of being and, more briefly, the so-called Stoic categories (see Stoicism §6). He presents in VI 2 his own account of the genera of intelligible being, which for him is the only real being, and in VI 3 a revised version of Aristotle's categories doctrine is offered as an account to hold for sensible things. Plotinus' criticisms of Aristotle's category doctrine are founded on the assumption that it is about the genera of being. His main critical points are: (1) Aristotle's *Categories* fail to give a place to intelligible beings and hence cannot present a universal doctrine of the genera of being - it cannot be supposed to hold for both sensibles and intelligibles since there is no common genus for both and no discourse covering both at once; (2) each of the categories described by Aristotle fails to be one genus.

6 Human beings

A noteworthy feature of Plotinus' psychology is his use of Aristotelian machinery to defend what is unmistakably Platonic dualism. For instance he uses the Aristotelian distinctions between rational, perceptive and vegetative soul much more than the tripartition of Plato's *Republic* (see Psychē). He employs the Aristotelian notions of power (*dynamis*) and act (*energeia*), and sense perception is described very much in Aristotelian terms as the reception of the form (*eidos*) of the object perceived (see Aristotle §18). However, he never slavishly follows Aristotle and the reader should be prepared for some modifications even where Plotinus sounds most Aristotelian.

Plotinus identifies human beings with their higher soul, reason. The soul, being essentially a member of the intelligible realm, is distinct from the body and survives it. It has a counterpart in Intellect which Plotinus sometimes describes as the real human being and real self. As a result of communion with the body and through it with the sensible world, we may also identify ourselves with the body and the sensible. Thus, human beings stand on the border between two worlds, the sensible and the intelligible, and may incline towards and identify themselves with either one. For those who choose the intelligible life, philosophy (dialectic) is the tool of purification and ascent. As noted previously, however, it is possible to ascend beyond the level of philosophy and arrive at a mystical reunion with the source of all, the One. In contrast with the post-Porphyrian Neoplatonists, who maintained theurgy as an alternative, Plotinus stands firmly with classical Greek rationalism in holding that philosophical training and contemplation are the means by which we can ascend to the intelligible realm.

Plotinus' account of sense perception is an interesting example of how he can be original while relying on tradition. Sense perception is the soul's recognition of something in the external sensible world. The soul alone only knows intelligibles and not sensibles. If it is to come to know an external physical object it must somehow appropriate that object. On the other hand, action of a lower level on a higher is generally ruled out and a genuine affection of the soul is impossible because the soul is not subject to change. Plotinus proposes as a solution that what is affected from the outside is an ensouled sense organ, not the soul itself. The affection of the sense organ is not the perception itself however, but something like a mere preconceptual sensation. The perception properly speaking belongs to the soul. It is a judgment (*krisis*) or reception of the form of the external object without its matter. This judgment does not constitute a genuine change in the soul for it is an actualization of a power already present. In formulating this problem Plotinus' dualism becomes sharper, and in some respects closer to Cartesian dualism, than anything found in Plato or previous ancient thinkers. Plotinus contrasts sense perception as a form of cognition with Intellect's thought, which is the paradigm and source of all other forms of cognition. Sense perception is in fact a mode of thought but it is obscure. This is because the senses do not grasp the 'things themselves', the thoughts on the level of Intellect, but mere images. Since they are images they also fail to reveal the grounds of their being and necessary connections.

As the preceding account may suggest, Plotinus sees the goal of human life in the soul's liberation from the body and from concerns with the sensible realm and identification with the unchanging intelligible world. This is in outline the doctrine of Plato's middle dialogues. There are noteworthy elaborations, however. Plato holds that the soul's ability to know the Forms shows its kinship with them (*Phaedo* 79c-e). Plotinus agrees and presents a doctrine about the nature of this kinship which is left unclear in Plato. For as we have seen the whole realm of Forms is for Plotinus the thought of Intellect. The human soul has a counterpart in Intellect, a partial mind which in fact is the true self and is that on which the soul depends. This has two interesting consequences for the doctrine of spiritual ascent: (1) the soul's ascent may be correctly described as the search after oneself and, if successful, as true self-knowledge, as fully becoming what one essentially is; (2) on account of Plotinus' doctrine about the interconnectedness of Intellect as a whole, gaining this self-knowledge and self-identity would also involve gaining knowledge of the realm of Forms as a whole.

Plotinus' views on classical Greek ethical topics such as virtues (see Aretē) and happiness (see Eudaimonia) are determined by his general position that intellectual life is the true life and proper goal of human beings. He devotes one treatise, I 2(19), to the virtues. The suggestion in Plato's *Theaetetus* (176a-b) that the virtues assimilate us with the divine is central to his views on them, and serves as his point of departure. The question arises how to reconcile this doctrine with the doctrine of the four cardinal virtues in the *Republic*. Plotinus distinguishes between political virtues, purgative virtues and the paradigms of the virtues at the level of Intellect. These form a hierarchy of virtues. The function of the political virtues (the lowest grade) is to give order to the desires. It is not clear, however, how these can be said to assimilate us to god (Intellect), for the divine does not have any desires that must be ordered and hence cannot possess the political virtues. Plotinus' answer is that although god does not possess the political virtues, there is something in god answering to them and from which they are derived. Furthermore, the similarity that holds between an image and the original is not reciprocal. Thus, the political virtues may be images of something belonging to the divine without the divine possessing the political virtues.

There are two treatises dealing with happiness or wellbeing: I 4(46) and I 5(36). In the former treatise Plotinus rests his own position on Platonic and Aristotelian doctrines, while criticizing the Epicureans and Stoics. He rejects the view that happiness consists at all in pleasure, a sensation of a particular sort: one can be happy without being aware of it. He also rejects the Stoic account of happiness as rational life. His own position is that happiness applies to life as such, not to a certain sort of life. There is a supremely perfect and self-sufficient life, that of the Intellect, upon which every other sort of life depends. Happiness pertains primarily to this perfect life that is in need of no external good. Since all other kinds of life are reflections of this one, all living beings are capable of at least a reflection of happiness according to the kind of life they have. Human beings are capable however of attaining the perfect kind of life, that of Intellect. In the latter treatise Plotinus holds with the Stoics that none of the so-called 'external evils' can deprive a happy person of their happiness and that none of the so-called 'goods' pertaining to the sensible world are necessary for human happiness (see Stoicism §§15-17). In I 5 he argues that the length of a person's life is not relevant to happiness. This is because happiness, consisting in a good life, is the life of Intellect and this life is not dispersed in time but is in eternity, which here means outside time.

7 Influence

Plotinus is one of the most influential of ancient philosophers. He shaped the outlook of the later pagan Neoplatonic tradition, including such thinkers as Porphyry and Proclus, and he left clear traces in Christian thinkers such as Gregory of Nyssa (see Patristic philosophy §5), Augustine and Boethius. Since all these were extremely influential in their own right, Plotinus has had great indirect impact. He clearly played a significant role in preparing for medieval philosophical theology. A forged extract from the *Enneads* was known in the Islamic world as the *Theology of Aristotle*. The supposed Aristotelian origin of this text helped the fusion of Aristotelianism and Neoplatonism that characterizes much of Arabic philosophy. Neoplatonism saw a revival in Europe during the Renaissance. A Latin translation of the *Enneads* by Marsilio Ficino first appeared in 1492 and gained wide distribution. Plotinus exerted considerable direct influence on many sixteenth-and seventeenth-century intellectuals. Even if the popularity of Neoplatonism and Plotinus receded in the seventeenth century, many individual thinkers since have read and been influenced by Plotinus, for instance Berkeley, Schelling and Bergson.

Pluralism

'Pluralism' is a broad term, applicable to any doctrine which maintains that there are ultimately many things, or many kinds of thing; in both these senses it is opposed to 'monism'. Its commonest use in late twentieth-century philosophy is to describe views which recognize many sets of equally correct beliefs or evaluative standards; and in this sense it is akin to 'relativism'. Societies are sometimes called 'pluralistic', meaning that they incorporate a variety of ways of life, moral standards and religions; one who sees this not as undesirable confusion but a proper state of things, espouses pluralism.

The principle famously known as Ockham's Razor - that we should posit no more entities than our purposes demand - expresses a disinclination to ontological pluralism, though not of course a promise that we can always dispense with it (see Ockham, W. §2; Durandus of St Pourçain). Kant believed such a disinclination to be a basic trait of human reason, which naturally seeks as much unity as possible in its view of reality (see Kant §8)). A similar evaluation emerges in Leibniz's view that God's creation contains a maximum of individual variety falling under a minimum of general laws.

Ironically, Kant's own philosophy sowed the seeds of pluralism in another sense, at least equally important and conceptually rather more difficult: that there may be many ways of interpreting the world and reacting to it, very different from each other yet equally justified. Kant did not himself take that view; but by making the world we experience something that we construct, and which therefore depends on the nature of our own mental workings, he invited the thought that at other times, or in other cultures, others might construct it differently.

At one level, Hegel accepted the invitation, declaring the forms of human thought and experience to be historically variable. But this was no true pluralism, since he held the variation to be progressive, and progressing towards the point at which consciousness will see things as they really are. So later ways of thinking, though still inadequate, are less inadequate than earlier ones, and Hegel's friendliness to pluralism is only provisional - behind it lies a firm commitment to the view that ultimately there is just one true way to see reality.

Monotheists are almost certain to be unfriendly to pluralism, since they will typically hold that there is a uniquely true set of beliefs and a uniquely right set of moral standards - those of the deity - so that any *de facto* pluralism is just an effect of human incapacity. Hence significant support for any thoroughgoing pluralism acquired real momentum only in the nineteenth century as thinkers, following the lead of D.F. Strauss and Feuerbach, began to view God as a projection of the human mind, or to abandon theism altogether. Nietzsche's 'perspectivalism' - truth exists only as truth from a particular perspective, and the Truth (capital T) does not exist at all - is one of its products (see Nietzsche, F. §4).

That conclusion was certainly connected with Nietzsche's view that belief and the closely related concept of truth are in fact instruments for advancing the believer's purposes ('Truth is that kind of error without which a species cannot live'); and a variant of this view is central to the pragmatism of William James. It leads very naturally to pluralism. For we are quite familiar with the idea that different individuals or groups may have different purposes and needs, as may the same individual or group at different times and in different circumstances. So if responsiveness to needs and purposes is what validates belief and/or determines truth, these may differ as well. Then we find ourselves with a plurality of truths, and a resulting tendency to hold that 'true', when properly used, must really mean 'true *for* S' (some person or group) and that where the relevant values of S differ, two 'truths' are not necessarily commensurable with each other (see Relativism).

One should distinguish between a true pluralism and the toleration of minority opinions or codes of behaviour. Toleration of deviant opinion is quite compatible with believing that there is just one set of truths. Non-interference can still be argued for on the grounds that the existence of certain false opinions and certain forms of bad behaviour are lesser evils than what would be needed to suppress them; or, as J.S. Mill (1859) argued, because we may be more likely to light on the truth if a variety of opinions are represented in our debates - a view one might call *methodological* pluralism. However, in going on to praise individuality as an essential component of human well-being, and to argue the case for allowing a private sphere immune from legal and social pressure, Mill was advocating a limited but genuine pluralism of life-styles. A concern of liberal political theory

has been to understand the arrangements needed to permit and support such pluralism while maintaining a stable society.

This is no purely theoretical exercise, for there are also social and political influences favouring certain types of pluralism. Many societies are now culturally and religiously diverse; and 'postcolonial' attitudes make for a far more egalitarian and less judgmental approach to other peoples' practices and beliefs. Sustaining such an attitude, where different cultures find themselves in close contact with each other, indeed for many purposes intermingled, is not without its problems; and it is not clear how far religious believers can sincerely regard other religions in so tolerant a way without in effect giving up their own.

Plutarch of Chaeronea (*c.* AD 45-*c.*120)

The Greek biographer and philosopher Plutarch of Chaeronea is the greatest Greek literary figure of the first century AD. He is properly called Plutarch of Chaeronea, to distinguish him from the minor fourth-century AD Platonist Plutarch of Athens. His fame rests not so much on his contributions to philosophy as on those to history and biography. Indeed, despite the survival of a large body of philosophical and semi-philosophical writings known under the collective title Moralia, most of his more technical philosophical treatises have perished. Nevertheless, his importance for our understanding of the development of Middle Platonism is great. Plutarch is a reasonably orthodox Platonist (in so far as that expression has any meaning), although his Platonism has some distinctive features. Against Antiochus, he accepts the sceptical New Academy as part of the Platonic tradition, but he also exhibits a degree of cosmic dualism (postulating a pre-cosmic evil soul) which goes rather beyond the Platonist norm. It is misleading, however, to oppose him to a supposed tradition of 'school-Platonism'.

*As the ethical 'end' or 'goal' (*telos*), he adopts the normal later Platonist one of 'likeness to god'. In ethics, as in logic, he tends to favour Aristotelianism rather than Stoicism (advocating, for example, moderation of the passions rather than their extirpation, and appropriating as authentically Platonic the Aristotelian categories and syllogistic). A tendency to favour New Academic scepticism seems indicated in the titles of some of his lost works, but is not very evident in the surviving ones.*

As first principles, he postulates a pair consisting of God - who is one, the Good, and really existent - and the Platonic-Pythagorean Indefinite Dyad, which is a principle of multiplicity, and ultimately material. As secondary principles, he seems to adopt a logos*, or active reason-principle of god, although the evidence for this is not copious, and a world-soul, which is essentially irrational but desirous of 'impregnation' with reason by the* logos*. There is also in the universe, however, an active principle of disorder, which can never be entirely mastered by the divinity. A hint of Persian dualism seems to enter here into Plutarch's thought. Such a system is derivable above all from his essay On Isis and Osiris, which may not be entirely typical. Other distinctive features include a tendency to triadic divisions of the universe, a developed demonology, and an interesting combination of Aristotelian and Stoic logics.*

1 Life and works

Plutarch of Chaeronea is the dominant figure in Platonism, and in Greek literature as a whole, in the latter part of the first century AD, and the first quarter of the second (see Platonism, Early and Middle). Born probably around AD 45 (he presents himself as a beginning student of philosophy in Athens in AD 66/7), he lived until at least AD 119, when he is reported to have been appointed Procurator of Achaea (presumably a largely honorary post) by the emperor Hadrian. He came from the small town of Chaeronea in Boeotia, where his family had been prominent for many generations, and this connection remained important to him throughout his life, as also did his connection with Delphi, where he was elected in later life a priest of Apollo. In Athens he studied under a Platonist named Ammonius (not to be confused with Ammonius, son of Hermeas), of Egyptian origin, who became a prominent citizen of Athens, and to whom Plutarch seems to have owed a degree of cosmic dualism which colours his Platonism. In later life, after undertaking some travel, notably to Rome, he settled down in Chaeronea, presiding over a 'mini-Academy' of his friends and relations, and taking an active part in local politics, including those of Delphi. Most of his dialogues are set in either Chaeronea or Delphi.

A vast body of work by Plutarch has come down to us, much of it, however, non-philosophical - most notably his 'parallel lives' of famous Greeks and Romans - although philosophical reflections may be found anywhere in his work. On the other hand, many of his more technical philosophical works, some with tantalizing titles, are lost (discarded, no doubt, in favour of Neoplatonist treatments of the same subjects, making a full evaluation of his philosophical position more difficult. He was, however, a regular (one hesitates to say 'orthodox') Platonist. It would be wrong to regard him as a maverick, or an 'eclectic'.

His chief surviving works of philosophical interest are the following: *On Isis and Osiris*, *On the E at Delphi*, *On the Oracles at Delphi*, *On the Obsolescence of Oracles*, *Is Virtue Teachable?*, *On Moral Virtue*, *On Delays in Divine Punishment*, *On the Daemon of Socrates*, *On the Face in the Moon*, *Problems in Plato*, *On the Creation of the Soul in the Timaeus*. Interesting things are said elsewhere, scattered, for example, through the biographies, in

the nine books of *Table Talk*, or in the many other essays which, although Plutarch would have considered them ’philosophical’, we would tend to regard as merely ’literary’. We also have a number of treatises of a polemical nature, directed against other schools, notably the Stoics and the Epicureans. Against the Stoics are: *On the Contradictions of the Stoics* and *On Common Conceptions [koinai ennoiai], against the Stoics*; and against the Epicureans: *That one cannot live happily following Epicurus*, *Against Colotes* (Colotes had attacked the implicit scepticism of Plato and others) and *The Doctrine ’Live in Obscurity’* [*lathe biōsas*, the basic Epicurean injunction].

This is a vast corpus, and certain variations of doctrine undoubtedly emerge, but basically Plutarch can be seen as a consistent Platonist, well within the parameters of what might be considered ’orthodoxy’ - bearing in mind that there was no canon of orthodoxy, and that a wide latitude of doctrine was acceptable within the tradition.

2 Ethics

As regards the ‘end’ or ’goal’ (*telos*) of life, for Plutarch, as for all later Platonists after Antiochus, the supreme object of human endeavour is ’likeness to god’ (as opposed to the Stoic ‘conformity to nature’, adopted by Antiochus (see Platonism, Early and Middle §8). This is achieved through the exercise of the virtues, but particularly through the acquisition of theoretical wisdom (*sophia*), rather than practical wisdom. We find this well expressed in a passage of the dialogue *On Delays in Divine Punishment* (550d), where Plutarch himself is the speaker. Here, in fact, the *telos* of conformity to nature is artfully subsumed under the ’higher’ one of likeness to god by the statement that ’Nature kindled vision in us’, so that the soul should come to a knowledge of god.

On the subject of virtue and happiness, Plutarch inclines on the whole to the more ’broad-minded’ ethical position of Antiochus, as against the Stoic-Pythagorean asceticism (see Neo-Pythagoreanism) observable in such figures as Eudorus and Philo of Alexandria. Significantly, his terminology in this area is Aristotelian rather than Stoic. In his essay *On Moral Virtue* we have a useful statement of his ethical theory. It takes the form of an attack on the Stoic position that the soul is unitary, and that there is no such thing as a distinct irrational part. Moral virtue is to be distinguished from theoretical virtue, in that it has emotion (*pathos*) as its subject matter and reason as its form, reason acting to harmonize the essentially disorderly passions, and thus producing a set of virtues as ’means’. This is really Peripatetic theory (see Aristotle §22) overlaid with Pythagorean influences.

Peripatetic too is Plutarch’s position that all three types of good - spiritual, bodily and external - make their contribution to happiness (*On Common Conceptions* 1060c-), aligning him once again with Antiochus against Eudorus. In this passage he attacks Chrysippus for not admitting bodily and external goods as an essential component of happiness, although nature commends them to us (see Stoicism §§15-6).

3 Metaphysics - first principles

Plutarch’s view of the supreme principle, or God, is just what one would expect of a Platonist: God is real being (*to ontōs on*), eternal, unchanging, non-composite, one (*On the E at Delphi* 392e). He knows all things and directs all things (*On Isis and Osiris* 351d, 382b), thus exercising providence (*pronoia*). He is also ’the object of striving for all nature’ (*On the Face of the Moon* 944e), and thus is aligned with the Aristotelian prime mover (see Aristotle §16). To this ’Monad’ is opposed an ’Indefinite Dyad’, as ’the element underlying all formlessness and disorder’ (*On the Obsolescence of Oracles* 428f; *On Isis and Osiris* 369c). This is not simply matter, but a more actively disorderly principle which acts on matter, in opposition to the Monad, to produce the differentiation and multiplicity of beings. It is this principle which Plutarch sees as active in the pre-cosmic chaos described in Plato’s *Timaeus*. The interaction of these two primal forces generates, first, number (and so the system of Forms) and then the physical world. In Plutarch’s emphasis on the Dyad (and on the existence of an ’evil’ world-soul) there is discernible an element of dualism which is more than Platonic, although its derivation is unknown (see also his comparison of Monad and Dyad with Ormuzd and Ahriman the warring supreme divinities of Zoroastrian religion, at *On Isis and Osiris* 369e).

The first principle creates, and relates to, the world through suitable intermediaries, primary among which is the *logos* (cosmic ‘reason’) (see Logos §1). Originally a Stoic concept, *logos* appears in a Platonist context already in the thought of Philo of Alexandria. It has been doubted whether Plutarch really maintained a *logos* doctrine, but the evidence that he did seems sufficient. In a passage of *On Isis and Osiris* (373a-b), for example, two aspects, or moments, of the god Osiris are distinguished as his soul and his body. His soul is ’eternal and indestructible’,

whereas his body is repeatedly torn asunder by Typhon (the Indefinite Dyad) and is constantly being reassembled by Isis (the world-soul). The ’body’ of Osiris, as it turns out, is the *logos* in its immanent aspect, in matter, whereas his soul is the transcendent *logos*, as the sum total (and organizing principle) of the Forms in the mind of god.

As for the status of the Forms as thoughts of God (the standard Middle Platonic view), we may refer to the passage in the essay *On Delays in Divine Punishment* mentioned in §2, where we see God himself, as the totality of the Forms, presented as the model (*paradeigma*) for the physical world, and for mankind in particular. This seems based on an interpretation of Plato’s *Timaeus*, according to which god (as the creator or ‘demiurge’) is his own *paradeigma* (instead of looking to it as something external). Unfortunately, we lack Plutarch’s essays *Where are the Forms?* and *How does Matter Participate in the Forms? It Makes the Primary Bodies*, but we can derive some idea of their contents both from this passage and from the title of the latter essay. Presumably what Plutarch means by ’it makes the primary bodies’ is that matter (with which Plutarch has no hesitation in identifying Plato’s ’receptacle’ in *Timaeus*), on being ‘irradiated’ by form, constitutes the basic triangles of which the four elements are composed.

Besides the general theory of Forms, Plutarch produces in *On the Obsolescence of Oracles* a remarkable doctrine connecting the five ’greatest kinds’ of Plato’s *Sophist* with the basic constituents of the physical world, namely, the four elements plus the physical world as a whole. He is here taking the five basic molecules described by Plato in the *Timaeus* (53c-56c) - of which the cube represents earth, the pyramid fire, the octahedron air and the eikosihedron water - and relating them respectively to rest, motion, identity and difference, while the dodecahedron, which represents the physical world as a whole, corresponds to being. Whether this is an original contribution of Plutarch’s is not clear, but it anticipates interestingly the use of the ’greatest genera’ by Plotinus as a set of ’categories’ for the intelligible world (see Plotinus §4).

The celebrated ’dualism’ of Plutarch comes out in his description of the Forms as ‘seized by the element of disorder and confusion which comes down from the region above’ (*On Isis and Osiris* 373a). This seems to imply not just the rather negative unruly material principle of the *Timaeus*, but a positive force, a ’maleficent soul’, which has at some stage itself already broken away from the intelligible realm. We seem thus to be brought close to Gnostic beliefs, but Plutarch claims the authority of Plato for this. In *Laws* (X 896d), Plato seems, at least, to postulate, in opposition to the beneficent world-soul, another ’of the opposite capacity’, which is responsible for all irrational motion in the universe. Anything which is soul is also alive and self-moving, so that a considerable step has been taken beyond the inanimate principle of ’otherness’ or ’necessity’ postulated in the *Timaeus*.

4 Psychology

This ’negative’ or ’evil’ principle in the universe, however, must be distinguished from the world-soul proper, which, although essentially irrational, is a ’positive’ force, in the sense that it strives for ordering (or in mythical terms, ’impregnation’) by the *logos*. Plutarch’s position on this, however, is somewhat complex. In *On Isis and Osiris*, Isis is equated with the ’receptacle’ of the *Timaeus* and with matter, as well as with wisdom, and takes on very much the same role as does wisdom in the earlier system of the Platonizing Jew Philo of Alexandria, suggesting a tendency in Alexandrian Platonism (if we may connect Plutarch with that through Ammonius) to identify at least the positive aspect of matter with the world-soul, and to connect them both with the Pythagorean/Early Academic Dyad, which is not properly an ’evil’ principle, as is the ‘Seth-Typhon’ figure in Plutarch’s system. This amalgam produces an entity which is on the one hand ’fallen’ and imperfect (although filled with longing for perfection), on the other the cause of our creation and the vehicle by which we can come to know God. In his treatise *On the Creation of the Soul in the Timaeus*, Plutarch presents us with the remarkable image of a ‘slumbering soul’, which is periodically roused to rationality by the ’better element’ (the *logos*). This seems to be inspired by a non-literal interpretation of the myth of Plato’s *Statesman*, since it becomes plain from what follows (1027a) that the process of arousal is actually not periodic but continuous. We have therefore an essentially irrational world-soul, completely interwoven with a rational soul or *logos*, thus maintaining a constant cosmic tension.

The belief in an eternal, independent irrational soul naturally has consequences for Plutarch’s views on the composition both of the world-soul and of the individual soul, as described, in particular, in the *Timaeus*. Indeed, Plutarch devotes to this question a whole treatise, *On the Creation of the Soul in the Timaeus*, constituting a

detailed exposition of his views, in the form of an extended commentary on the *Timaeus*. The specific problem concerns what we are to understand by 'the substance which is divisible about bodies' in the description of the elements of the soul. Plutarch criticizes his Platonist predecessors, such as Xenocrates §2 and Crantor, for not recognizing that this 'divisible substance' must in fact be the irrational 'disorderly' soul that animates the pre-cosmic chaos (*On the Creation of the Soul* 1014b). So this disorderly element which Plato calls 'necessity' (*Timaeus* 48a, 56c, 68e) cannot be taken as something characterless, such as matter, but must be an active principle, the disorderly or 'maleficent' soul. We must distinguish, he argues, between matter, as described in *Timaeus* (50e), which is bereft of all quality and power of its own, and this refractory element in the universe, which has distinct powers and qualities. He adduces Plato (*Philebus* 24a and *Statesman* 273b) to fortify his position - which depends, however, on the premise of the unity of Plato's thought.

A noteworthy doctrine of Plutarch's is his strong distinction between the human soul and the human mind. Of course, such a distinction had always been present in some form in philosophic speculation, and perhaps most notably in Aristotle's *On Soul*, but Plutarch seems to give it a special twist. In *On the Face in the Moon*, we find the assertion that mind is just as distinct from soul as soul is from body. We may note here, apart from the unequivocal tripartition of the human being, a notion of three terms and two conjunctions - body and soul producing the irrational soul (*to alogon*), soul and mind producing the reason (*logos*). The rational soul, then, as our centre of consciousness, is not to be seen as mind in its pure state, but rather as consisting in the conjunction of pure mind with something lower and essentially irrational. This doctrine takes on a further twist in *On the Daemon of Socrates*, where we find the mind presented as in a way *external* to the body, presiding over it as its 'daemon', while different individuals have very different relations to their highest element, some allowing it to float freely 'above' them, others dragging it down into contamination with bodily concerns. This owes something, perhaps, to Aristotle's *On the Soul* III 5, but also to Plato's *Timaeus*. The latter (90a) refers to 'the most authoritative element of our soul' as a daemon, which God has given to each one of us, and which raises us up from earth towards our kindred in the heavens. Nevertheless, Plutarch's doctrine is interestingly distinctive, finding analogues in certain treatises of the *Corpus Hermeticum*, Treatises I and X in particular.

This threefold division of the individual has its equivalent on the cosmic level, in the form of a threefold division of the universe, such as we find in *On the Face in the Moon*, where Plutarch bases his theory on one of Xenocrates' concerning the combination of three 'densities' or 'tunings' of matter with the elements fire, air and earth respectively. Plutarch also proposed another, more complex, theory, which can be found in *On the Daemon of Socrates*. Here, the Monad, mind and nature (which could be taken as the irrational soul) are presented as three 'links' holding together four levels of being. How seriously Plutarch took, or means us to take, these constructions is uncertain, but they do serve as evidence for the existence of interesting lines of speculation. In particular, the identification in the latter passage of the highest principle as a Monad superior to a mind finds something of a parallel in the theological chapter 10 of the *Didaskalikos* of Alcinous.

5 Daemonology

The more transcendent the supreme deity becomes, the more he stands in need of other beings to mediate between him and the material world, over which, in Platonism, he always exercises a general supervision (*pronoia*). The *logos* fulfils this function, but Plutarch, like all other Platonists, also postulates a daemonic level of being, and his theorizing about these entities is more elaborate than is found elsewhere. For Plutarch, both god's transcendence and his providential care for the world must be preserved, and the universe can tolerate no sharp divisions or sudden transitions. The basic inspiration for this concept of daemons in linking together the incompatible extremes of the universe is a famous passage in Plato's *Symposium* (202e), but the details were obviously worked out further by his follower Xenocrates, who is a major source for Plutarch.

In the dialogue *On the Obsolescence of Oracles*, for example, we find a geometrical elaboration of the basic Platonic doctrine attributed to Xenocrates, and commended by the speaker, according to which daemons are compared to isosceles triangles, median between the equilateral of the gods and the scalene, representing humanity. Earlier Plutarch's adoption of Xenocrates' tripartition of the world in *On the Face in the Moon* was noted. Here the moon, which served there as the focus of the median realm, and as the proper place of souls (and indeed as the symbol of the world-soul), is now made to serve also as the proper place of daemons, which is suitable to their mediating status.

Plutarch, like Xenocrates, recognizes the existence of both 'good' and 'evil' daemons, and in this connection we must distinguish a complexity, and possible incoherence, in his account of them. According to one view, daemons are souls in the process of either ascent from or descent into incarnation; according to another, they are permanent members of a spiritual hierarchy. Plutarch seems to entertain, at various points, both what one might term a 'static' and a 'dynamic' theory of daemons. A good statement of the latter view occurs in *On the Obsolescence of Oracles*, which describes a constant process of transmutation of human souls into daemons and 'heroes' (a distinct category in later Platonism), and even occasionally (as in the case of Heracles) into gods. There may well be a degree of incoherence in Plutarch's theory. It is really not clear whether some souls remain permanently disembodied (to constitute either good or evil daemons), or whether all are subject to the process of ascent and descent.

It remains to speak of the personal or guardian daemon, the most notable example of which, for later Platonists, was the 'daemon' of Socrates. In Plutarch's essay *On the Daemon of Socrates*, we find a vivid description of how the guardian daemon can assist an individual. These guardians are, it seems, all souls who have been through incarnation themselves, and have now earned their release from the cycle of rebirth; they are not souls that have never suffered incarnation. Only noble souls are qualified to serve as guardians.

In connection with his theory of the guardian daemon, Plutarch indulges in some interesting speculations about the mode of contact between the daemonic and the human mind, and between mind and matter in general (*On the Daemon of Socrates* 588f-589b). This is a problem which had not bothered Platonists, from Plato onwards, as much as it should have, and Plutarch does not really address the true difficulties (he simply speaks with wonder of the 'slight impulse' by which the mind sets the bones and sinews in motion), but at least he raises the question. Only Plotinus, later, really tries to address the problem of the mode of interaction between the material and the immaterial (for example, in *Enneads* III 6(26).1-5).

6 Logic and epistemology

Technical logic was not among Plutarch's more vital concerns, and there is in his extant works not much to indicate which system he followed, although there is no reason to think that it differed much from that set out somewhat later in Alcinous' *Didaskalikos* (ch. 6), which is itself a basic account of Middle Platonic logic. Plutarch did compose a *Lecture on the Ten Categories*, now lost, of which one would gladly have known the contents. Did he remain true to Aristotle, or did he, perhaps, adopt some of the Pythagoreanizing 'corrections' introduced by Eudorus, such as the placing of quality before quantity? We also find in the extant list of Plutarch's works two other treatises whose titles sound logical, *A Reply to Chrysippus on the First Consequent* and *On Tautology*, as well as some works on rhetoric, which was counted as a part of logic. Apart from revealing a tendency to attack the Stoics, which is what we should expect from Plutarch, these titles do not tell us very much.

That Plutarch regarded Plato as being already in possession of the so-called Aristotelian logic is indicated in *On the Creation of the Soul*, which is a commentary on *Timaeus* 37a-b, a passage in which most of the Aristotelian categories might be discerned, if viewed with the eye of an adherent. Sceptics might object to the equating of the examination of identity and difference with quantity and quality, and the equating of a thing's *existence* in a certain sense with its *activity*. A loyal Platonist could, however, argue that any distinguishing of a thing from other things must involve a statement of its quality and quantity (as indeed Aristotle himself notes in the *Categories* (11a15)), and that, on Plato's own principle, as laid down in the *Sophist* (248c), existence means acting and being acted upon. Furthermore, the Aristotelian categories 'being-in-a-position' and 'having' can conceivably be viewed as latent in the latter part of the passage. Plato, then, in Plutarch's view, knows the categories, but is not concerned with enumerating them anywhere as baldly as did his famous pupil. On the basis of these categories, Plutarch declares, Plato constructs his epistemology, according to which the soul, when operating on the level of sense-perception, produces opinions which are fine and true, and when operating on the level of pure reason, intelligence and knowledge. These true opinions and beliefs, a Platonist would claim, are naturally expressed in syllogistic form. Alcinous, in *Didaskalikos* ch. 6, discerns various syllogisms in the first and second hypotheses of the *Parmenides*. Plutarch would doubtless have agreed with him, but we lack any evidence on this. In another passage, however, from the polemical treatise *Against Colotes* (1115d-), Plutarch appears to identify Plato's discussion of non-being as 'otherness' in the *Sophist* (255a-258e, especially 257b) as providing a stimulus to both Aristotelian and Stoic logic. Aristotle and the Stoics, the argument runs, seized on the concepts of 'not-being' and

'otherness' discussed in the *Sophist*, divested them of their metaphysical implications, and constructed purely logical systems out of them.

In projecting the Aristotelian and Stoic logical systems back into Plato, Plutarch is in agreement, as has been said, with what we find in Alcinous, and also among other near-contemporaries, such as Apuleius and Galen. There is no sign in his extant works of the disposition to attack Aristotelian logic, in particular the categories, that is evident in Eudorus before him, or in his own follower Atticus. On the other hand we do find, in *On the E at Delphi*, an interesting commendation of the Stoic hypothetical syllogism as the basic component of human reasoning, as stated by Plutarch's friend Theon. He seems to rank it as superior to the Aristotelian, but this may simply be a consequence of the context, which concerns the elucidation of the Delphic E, here interpreted as 'if' (*ei*).

JOHN DILLON

List of works

Plutarch (late 1st-early 2nd century AD) *Lives*, ed. B. Perrin *et al.*, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1914-26, 11 vols.(Greek text with facing translation: comparative pairs of biographies of major figures from Greek and Roman history.)

Plutarch (late 1st-early 2nd century AD) *Moralia*, ed. F.C. Babbitt *et al.*, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1927-76, 16 vols.(Greek text with facing translation: essays, speeches and treatises on a wide range of issues, largely philosophical. Of particular importance are volumes 5, 7 and 12-13.)

References and further reading

Alcinous (*c*. 2nd century AD) *Didaskalikos tōn Platōnos dogmatōn*, in J. Dillon (ed.) *Alcinous, The Handbook of Platonism*, Oxford: Clarendon Press, 1993.(English translation, with introduction and philosophical commentary.)

Pneuma

Pneuma*, ’spirit’, derives from the Greek verb* pneo*, which indicates blowing or breathing. Since breathing is necessary for life and consciousness,* pneuma *came to denote not only wind and breath but various vital functions, including sensation and thought, and was understood by some philosophers as a cosmological principle. It became especially important in Stoicism, which explained the world in terms of matter and the rational structure exhibited in all its forms; this is established by rhythmical variations in the* tonos *or ‘tension’ of the* pneuma*.*

In Hebrew tradition, where Greek was used, pneuma *stood for life, consciousness, and for invisible conscious agents, angels or demons. In Christian thought it denotes divine inspiration, in particular the Holy Spirit acknowledged as a divine Person. At John 4:24 it is used, unusually, to describe God himself.*

1 Early Greek philosophy and medicine

Anaximenes (§1), the third in the traditional list of philosophers, regarded air as the basic substance of the universe, which it penetrated and controlled like breath in the human body; it was thus divine, or the source of divinity. Other forms of matter derive from it by condensation (wind, water, earth) or rarefaction (fire). In most accounts it is named as air, *aēr*, but *pneuma* is once found, and is a likely alternative.

Diogenes of Apollonia (§§2-3) also regarded air as the universal source, an imperishable and intelligent divine being which prescribes the orderly structure of the world: ’All things see and hear and have intelligence from this same (thing)’. It constitutes the soul (see Psychē) of all living creatures; and an elaborate description of the veins in the human body probably served to show how it was distributed. Theophrastus summarizes Diogenes’ views of sensation and emotion; apparently the air within us assumes various qualities which it transmits to the brain. There is no explicit reference to *pneuma*; but in fragment 4 ’men and other animals live by the air which they breathe’ (*anapneonta*).

Meanwhile Empedocles (§6) had also taught that air is diffused through the body (fr. 100), but without giving it a primary role in sensation; rather, each of the four elements is perceived by the corresponding element within us (fr. 109); but these are mixed together in the blood, so that consciousness resides in the heart (fr. 105). Thereafter physicians centred on the island of Cos continued to regard the brain as the central directive organ, while the Sicilian school located it in the heart, from which *pneuma* proceeds along with the blood.

Plato uses *pneuma* to denote both wind and breath. At *Theaetetus* 152b people’s differing perceptions of the same wind (*pneuma*) as warm and cold are used to illustrate the subjectivity of sense perception. At *Phaedo* 70a, 77e, the theory of a breath-soul is gently derided. The physiology of the *Timaeus* probably reflects the teaching of the Sicilian school conveyed by Plato’s contemporary Philistion, particularly in the description of diseases; 82e refers to noxious *pneuma* in the veins; 78-9 discusses the physics of respiration, and choking sensations are mentioned at 84e and 91e, but there is no general attempt to connect *pneuma* with consciousness or muscular control.

Sicilian influence can also be found in Aristotle’s contemporary Diocles of Carystus and in Aristotle himself. Both distinguish two species of *pneuma*: the air which is breathed in and regulates the temperature of the body, and a psychic *pneuma* regarded as the seat of vital warmth which resides in the heart, once again identified as the seat of consciousness (see Strato §5).

2 The Stoics

The Stoics gave the concept of *pneuma* its most comprehensive development (see Stoicism §3). It was described as a blend of air and fire, the two active elements; but an alternative theory conceived of it as the substance underlying the four elements, although its fineness and rapid movement are still emphasized. *Pneuma* varies in its *tonos* or intensity; and rhythmical variations of *tonos* can exhibit structural organization and thus express reason itself, as we now know the human voice does. Rationality is thus present at various levels; in the consistency of physical substances, in the self-preservation of plants and animals and in human reason, itself identified as a physical system, the ’directive principle’, *hēgemonikon*, located in the heart, assuming the old theory of the arteries as air-channels by which pneumatic messages are accepted and delivered. Sight as well as hearing was explained by impulses of *pneuma*.

Human reason itself is a lower analogue of the cosmic reason which penetrates every level of being such that the cosmos is compared to a living organism whose parts exhibit orderly coherence. In its physical aspect that reason is described as 'constructive fire' which generates the four elements and the orderly structure of the world, and persists when this structure is resolved back into it in a universal conflagration, from which a new and similar world will evolve. In contrast, the human reason can survive death, but not persist indefinitely.

The Stoics acknowledged the traditional Greek cults, sometimes identifying the cosmic reason ('intelligent *pneuma*') with Zeus and explaining the other gods as physical elements (for example, Hera as air, *aēr*) (see Stoicism §5). Since the world existed for the benefit of rational creatures, especially mankind, some later Stoics conceived Zeus in theistic terms as kindly and protective. Less perceptive critics, including many Christians, caricatured the Stoics as mere pantheists who identified God with the material universe.

Among medical writers Erasistratus distinguished between the vital *pneuma* centred in the heart and the psychic *pneuma* residing in the brain. A similar doctrine was taught by Galen, who is otherwise critical of Erasistratus. Neither kind of *pneuma* is identified with the soul; the psychic *pneuma* is its primary instrument. (For the Pneumist school of medicine see Hellenistic medical epistemology §1.)

3 Jewish and Christian thought

Stoic influence appears in the biblical book of Wisdom (7: 22), which represents the divine wisdom as a distinct personality endowed with intelligent spirit (*pneuma noeron*). In Philo of Alexandria (§4) Platonic ideas predominate, and the Logos assumes more importance; in *Creation* 1.24 it is identified with the 'intelligible world' (see Logos §2). *Pneuma* however reproduces two distinct words employed in Israelite tradition; *ruach* is a god-given life-giving principle which assumes personal characteristics only when located in a human body; *nephesh* denotes this principle as personalized. Philo used *pneuma* to denote both wind and breath, which (1) permeates the whole body, (2) is despatched through the windpipe for speaking, (3) is the material of the *hēgemonikon*, (4) is identified with divine inspiration conveying truth and knowledge. Philo does not, like the Stoics, use *pneuma* to denote God himself, although at *Giants* 27 it is given comparable epithets.

Pneuma is freely used in the New Testament, usually with little philosophical reference; but St Paul introduces a triad of 'spirit, soul and body' (1 *Thessalonians* 5: 23), perhaps a modification of the Platonic intellect, soul, body, suggested by the use of *pneuma* for *ruach*. Valentinians and other Gnostics used this Pauline triad in a doctrine of three classes of people: the Gnostic elect, ordinary Christians and pagans, all of whom had appropriate destinies. Other Gnostics (Sethians and Basilides) used *pneuma* to denote a principle intermediate between light and darkness, or between the highest reality and gross matter.

New Testament usage includes the commonplace 'wind' and 'breath', the latter also regarded as a life-giving force surrendered at death. Its use by St John (4: 24) to denote God himself is unusual; but it commonly denotes discarnate personal agents, both beneficent and malign, as well as the human personality or its various moods and affections, including divine inspirations, which are called, or originate from, the 'Holy Spirit' (or 'Spirit of God'), seen in the divine presence manifested in Jesus and present derivatively in his disciples and the Church at large. The Holy Spirit is linked with God and Christ in a trinitarian confession, at first informally (2 Corinthians 13: 14, *c.* AD 55), but soon in a credal formula (Matthew 28: 19, perhaps *c.* AD 100, but recalling established usage).

The Apologists and other second-century Christians adopted this trinitarian confession, but gave the Spirit little philosophical consideration, while emphasizing the divine Logos, as in Philo's Platonism, as God's intermediary. *Pneuma* however sometimes denotes the divine element in Christ, who is 'God according to the (his?) *pneuma*'. Origen (§3) carefully discusses all three divine Persons and distinguishes their functions, once confining the Spirit's influence to the Church, whereas the Logos instructs all rational beings in obedience to the Father. This strongly hierarchical Trinity slightly resembles the triadic theology developing in Platonic circles; Eusebius could quote Numenius with approval. But the terminology is quite different; and in Plotinus (§4) the third hypostasis, Soul, corresponds, if at all, with the Christian Logos; and *pneuma* is used, *inter alia*, for a principle which unites Soul with matter.

The Creed of Nicaea (AD 325), gave the Spirit only formal recognition; but a revival of Origenistic ideas soon encouraged a more concrete presentation: and *c.* AD 360 a controversy led to recognition of the full and equal divinity of the three divine Persons. Thereafter the Spirit's distinctive impact was recognized in devotional

literature more than in the Church's formal theology.

Poetry

Though poetry today seems a relatively marginal topic in philosophy, it was crucial for philosophy's own initial self-definition. In ancient Greece, poetry was revered as the authoritative expression of sacred myth and traditional wisdom. With Socrates and Plato, philosophy began by distinguishing itself from poetry as a new, superior form of knowledge which could provide better guidance for life and even superior pleasure. Just as the sophists were attacked for relativism and deception, so were poets stridently criticized for irrationality and falsehood. For Plato, not only did poetry stem from and appeal to the emotional, unreasoning aspects of human nature; it was also far removed from truth, being only an imitation of our world of appearances which itself was but an imitation of the real world of ideas or forms. He therefore insisted that poets be banished from his ideal state because they threatened its proper governance by reason and philosophy.

Subsequent philosophy of poetry has been devoted to overcoming Plato's condemnatory theory, while tending to confirm philosophy's superiority. This task, begun by Aristotle, was for a long time pursued primarily under Plato's general model of poetry (and indeed all art) as imitation or mimesis*. The main strategy here was to argue that what poetry imitates or represents is more than mere superficial appearance, but rather general essences or the ideas themselves. For such theories, poetry's relation to truth is crucial. Other theories were later developed that preferred to define and justify poetry in terms of formal properties or expression, or its distinctively beneficial effects on its audience. These strategies became increasingly influential from the time of Romanticism, but can be traced back to more ancient sources.*

The vast majority of theories follow Plato in treating poetry as a distinct domain, separate from and subordinate to philosophy. But since Romanticism, some have argued for the essential unity of these two enterprises. Great philosophy is here seen as the poetic creation of new ways of thinking and new forms of language, while the role of poetry as uniting and gathering things together so that the truth and presence of being shines forth.

1 The attack on poetry

As Plato remarked, 'There is an ancient quarrel between philosophy and poetry.' Philosophy developed in Athens, largely through a struggle for intellectual supremacy fought between the sophists and the artists. Poetry was the prime artistic enemy since it best expressed the sacred wisdom of tradition and lacked the banausic character of plastic art.Socrates andPlato aggressively defined philosophy in sharp contrast to poetry, claiming that it provided superior wisdom and more sublime joys of contemplation. The critique of poetry that attacked its irrationality and ignorance reached its virulent peak in Book X of Plato's *Republic*, but can already be found in earlier Socratic dialogues such as *Ion* and *Apology*. Poets (and their rhapsodes or performers, of which Ion is one) do not really know how and of what they speak; they have no genuinely teachable knowledge or skill, but must rely on the divine madness of inspiration, with which they in turn infect and mislead their audiences. Poets not only lack the knowledge to explain their compositions, but they have no real specialist knowledge of the topics or arts they describe; and they mislead the public by suggesting that they are wise men (*sophoi*) and have such knowledge. Philosophy, in contrast, is said to provide not only a superior kind of truth, but, as we see in the *Symposium*, greater beauty and higher pleasures of desire. If poetry affords a view of beautiful objects, philosophy offers the rapt contemplation of the more perfect forms on which these beauties are based, culminating in the vision of the form of Beauty itself.

Plato's *Republic* paradoxically affirms poetry's importance and its dangerous lack of value. Books II and III assign poetry a central role, though closely censored and controlled, in the education of the state's guardians (censorship being essentially limited to impieties and falsehoods about the gods and to the imitation of weak behaviour and low characters). But Book X banishes all poetry from the state except for 'hymns to the gods and praises of famous men'.

Plato offers many arguments here. Since poetry is merely a representation of the appearance of the objects in our world, which is itself a world of appearances that imitates the real world of ideal forms, poetry is metaphysically inferior - a mere appearance of an appearance. For similar reasons, it is also epistemologically inferior. As an imitation of an imitation, poetry is 'thrice removed from the truth', and its teachings are therefore unreliable and misleading, far worse than the opinions of artisans, let alone the knowledge of philosophers which reaches the

forms themselves. Poetry is also psychologically suspect because, in appealing to the senses and emotions rather than to 'the calculating and rational principle in the soul', it is based on and stimulates 'an inferior part of the soul'.

This intimate link to our lower nature of senses and passions provides Plato with his most damning argument against poetry: its insidious moral corruption. Poetry perverts the soul by strengthening its lower part and undermining its rule by reason - feeding 'the passions instead of drying them up, she lets them rule'. Since it is neither easy nor amusing to imitate calm wisdom, poetry relies on a display of strong emotions that noble people would be loath to display in reality but that they assume can be safely enjoyed when fictionally represented in another (for example, indulging one's pity for another's imagined grief and fear). But, Plato argues, since reason's guard is lowered while sentiment is raised, 'the contagion must pass from others to themselves'. Here we find a theory of poetry's irrational contagion that is psychologically more subtle than that offered in *Ion*. We also find the spur to Aristotle's defence of poetry through the idea of catharsis.

2 Defence of poetry as imitation

While Aristotle's *Poetics* defines poetry as imitation, thus distinguishing it from mere writing in verse, his account of imitation is broader and more positive thanPlato's. He insists on imitation's cognitive value and rejects the Platonic metaphysics that located general forms in a transcendental world of ideas. By their very nature, humans imitate more than all other animals and learn first through imitation. The pleasures of imitation or representation are essentially cognitive. Since we are pleased by representations of things that in themselves would displease us (for example, corpses and hated animals), such pleasure must come from the recognition or inference of the thing represented. For 'the act of learning is not only most pleasant to philosophers' but to others as well, even if they achieve less of it. Here we already see a recurrent pattern in Aristotle in which the defence of poetry none the less implies and reinforces the superiority of philosophy.

Aristotle thought that poetry's imitations diverged according to the poet's natural dispositions. 'Noble actions of noble heroes' were represented in tragedy and epic, while 'Comedy is an imitation of baser men'. Epic differs from tragedy in having narrative (rather than dramatic) form, a single meter, and no limit in length of action. Aristotle devotes most attention to tragedy, arguing that it is the higher form, since it is more concentrated, effective and unified. Its analysis in terms of six parts (most important of which are plot and character) initiates the formalist approach to poetry, which we shall consider later.

Despite its different modes, poetic imitation was united, for Aristotle, in representing general, essential truths (based on 'the laws of probability or necessity') rather than mere superficial appearances or concrete particularities. 'Poetry, therefore, is more philosophical and more significant than history, for poetry is more concerned with the universal, and history more with the individual.' Such praise may answer Plato's critique of imitation, but only by implicitly affirming philosophy's superiority. In any case, the idea of poetry as imitation of general truths was influentially revived in the eighteenth century by Samuel Johnson and applied to painting by Joshua Reynolds. Aristotle offers yet another way of defending imitation: in tragedy, as in portrait painting, representations should be ameliorative, making their noble subjects look 'better than they are'. Tragedy, moreover, is specifically defended against the charge that it corrupts the soul by inspiring passions of pity and fear. To protect the soul from their harmful lurking influence, such passions need to be exorcized through poetic arousal and harmlessly poetic, cathartic discharge.

The Neoplatonist Plotinus offered a strategy that could accept Plato's transcendental metaphysics and still affirm the value of poetry as imitation (see Plotinus §3). The poet, he argued, is able to circumvent the sensual objects of material nature so as to imitate 'the Ideas from which Nature itself derives'. Employing this strategy, later thinkers could argue that poetry was one of our highest achievements and forms of truth. The idea that poetry could represent transcendent ideas was maintained by Italian Neoplatonists in the sixteenth century and played a central role in the German Romanticism of Novalis and F.W.J. Schelling, for whom 'poetry is a representation of the absolute' (1859); the English poet Shelley similarly theorized that the'poet participates in the eternal, the infinite, and the one' (1824).

Like his colleague Schelling, Hegel saw art's function as one of representing ideas (see Hegel, G.W.F. §8); he therefore claimed poetry's superiority to all the other arts, on the grounds that it was better suited to represent

ideas and ideality since it relied less on material media. ‘Poetry is…the universal art of the mind’, which ‘is not fettered…to an externally sensuous material’ (1835-8). But such praise, like Aristotle’s, still subordinated poetry to the higher value of philosophy, which is altogether free of sensuous shape.

3 Artefact theories

Perhaps Aristotle’s most successful defence of poetry was not to redeem the value of *mimesis*, but to suggest a very different way of conceiving poetry - as a formal artefact that can be appreciated in terms of its own composition and not simply by what it represents. His *Poetics* is mostly an analysis of the form of tragedy in terms of its six parts (plot, character, diction, thought, spectacle and melody), showing how they should function to constitute the work as an effective, unified whole. Here Aristotle introduces his influential notion of organic unity, which requires that the object have ‘a proper magnitude’ and ‘a proper arrangement of the component elements’. The plot (the most important part) must be so tightly unified that ‘if any one part is transposed or removed, the whole will be disordered and disturbed’.

Aristotle’s conception of poetry as a rational activity of constructing objects (a making or *poiesis* involving knowledge and ‘true reasoning’) serves to counterPlato’s attack on poetry as irrational inspiration that contaminates the soul and corrupts action. But it also serves to minimize poetry’s ethical import and render it inferior to *praxis* or action. While poetry’s making has its end outside itself and its maker (its end and value being in the object made), action has its end both in itself and in its agent, who is affected by how they act, though not allegedly by what they make (*Nicomachean Ethics* VI).

Aristotle’s view of poetry as ‘making’ later developed into the idea that the poet does not so much imitate nature as create a separate imaginative world. Adumbrated in Sidney’s *An Apology for Poetry* (1583) and in some works of the Italian renaissance, this view achieved considerable influence and elaboration in the movements of Romanticism and ‘art for art’s sake’, which, in seeing poetry as a second creation, tended to regard it as an end in itself and to deify its creator. The early Romantic Karl Philip Moritz (1788) insisted that a poem (or any authentic work of art) creates a coherent world of its own and has its entire value and purpose in itself. This idea of poetry’s intrinsic order and value (and its external purposelessness) was reinforced by Kant’s account of the purposeful purposelessness of beauty and byEdgar Allen Poe’s advocacy of the ‘poem written solely for the poem’s sake’, a notion that inspired theorists of ‘art for art’s sake’ (1850). Their position is expressed in A.C. Bradley’s claim that the nature of ‘poetry is to be not a part, nor yet a copy, of the real world…but to be a world by itself, independent, complete, autonomous’ (1909).

Though it may distance itself from Romanticism, poetic theory of the twentieth century has mostly shared the view of poetry as a well-organized formal object to be examined and valued on its own linguistic terms. In continental theory, this approach is reflected both in the formalist and structuralist schools, while in Anglo-American criticism it is seen in T.S. Eliot’s early objectivism and in the New Critical views he inspired. In aesthetics it is best represented by Monroe Beardsley’s principles of independence and autonomy, which assert that literary works are individual, self-sufficient entities whose meaning and value are independent of the works’ genesis and reception (Beardsley 1973). Poetry’s gain in autonomy as ‘object’ seems, here again, to be paid for by isolating it from the real world of practice.

4 Expression theories

Another influential theory of poetry conceives it as the expression of the poet’s mind and feelings. Such expression theories can be traced back to Longinus, who, in defining sublimity, emphasized the poet’s greatness of soul and ‘vehement and inspired passion’ (*On the Sublime*). But in modern times they begin with Giambattista Vico (see Vico, G. §4), who linked poetry with myth, religion and language itself as the primal, creative way in which human imaginative thought gives form, meaning and expression to the reality and experience it encounters (Vico 1744). The idea of poetry as the natural expression of our formative, organic and synthetic imagination is developed byColeridge and endorsed by Shelley, who defines poetry as ‘the expression of the imagination connate with the origin of man’ (1824).Croce’s theory of art as formative intuition-expression also emerges from this line of thought, while other expressionist theories instead emphasize the expression of emotions (see Croce, B. §2; Artistic expression §4). Thus Wordsworth (1800) and Mill (1833) respectively define poetry as ‘the spontaneous overflow of powerful feelings’ and ‘feeling, confessing itself, to itself, in moments of solitude’. In contrast to

Mill's suggestion of the privacy of poetic expression, Tolstoy (1896) advocated that art should not merely express but communicate emotion to the audience. I.A. Richards (1924) likewise stresses the importance of poetry's effect on the readers' emotions and attitudes, though not on their intellectual beliefs. By viewing poetry as 'emotive language', he sought to free it from the demand on referential language that it be assessed in terms of literal or scientific truth, and so to free it from condemnation as absurd falsehood.

5 Use theories

Another group of theories defines poetry by its characteristic uses. If Aristotle helped define tragedy by its cathartic effect,Horace more widely and influentially defined poetry's aims as pleasure and useful instruction, which could be optimally combined. This idea, elaborated bySidney andSamuel Johnson (who thought it the writer's duty to better the world), is endorsed in some form by many modern humanists. Differences, however, typically arise both as to the nature of this pleasure (for example, how sensual, formal or cognitive it is) and as to the kind of edification poetry offers (for example, didactic presentation of alleged truths or merely an educational sensitizing of emotions). Matthew Arnold (1881) assigned poetry the necessary function of providing a consoling, meaningful interpretation of life, after science had destroyed the consolation of religion. Many other uses have been given to poetry, though Sartre (1948) defines it in contrast to prose by its non-utility. T.S. Eliot (1933), who increasingly emphasized poetry's functions of pleasure, edification, the expansion and refinement of language and (through it) of feeling and thought, also came to realize that poetry was a social product, whose functions and very forms change over history as a result of changing social factors and needs. This raises the doubt, voiced most loudly by analytic aestheticians, such as Morris Weitz (1955), that an open genre like poetry cannot be defined in terms of any permanent essence or function. Perhaps it is then best explained not by ahistorical definition but by rich historical narrative.

6 The unity of poetry and philosophy

While most follow Plato in viewing poetry as distinct from philosophy, several important Romantic and post-Romantic thinkers have advocated their synthesis or fundamental unity. The basic strategy is to construe poetry very broadly as the basic expression of our formative, synthetic imagination and then to argue that all creative philosophical work involves such imaginative construction in presenting a unifying vision of the world. Thus Hegel (as a young Romantic, before he developed his mature philosophy) affirmed that the philosopher needs as much aesthetic power as the poet, and Coleridge insisted that one cannot be 'a great poet without being at the same time a profound philosopher' (1817). As Schlegel defined the Romantic programme, 'poetry and philosophy should be made one' in a continuing effort to shape the world creatively through integrative imaginative interpretation (Schlegel 1797-1800).

With his striking view of the world as an artistic text created by imaginative interpretation, Friedrich Nietzsche too identifies the philosopher with the poet, since both try to reinterpret and so reshape the world in accordance with their will and values. Late Heidegger (1971) links poetry with philosophy in a different way. Real philosophy or thinking is poetic not because it wilfully reinterprets the world in a novel representation, but because it respectfully and concretely unveils or illuminates the world's obscured truth of being. Poetry is 'the saying of the unconcealedness of what is'. Moreover, since truth's revelation depends on the creation of 'a clearing' or world where it can occur and be seen, poetry founds truth by gathering objects together into a world and providing a sense of that world's unity. Here, as in earlier Romantic theories, poetry is broadly conceived as a formative force common to all art and not merely poetry in the standard sense.Heidegger calls this narrower genre 'poesy' and regards it as privileged since it exists in language, the medium of truth which identifies and links beings. The strategy of seeing poetry as philosophy by seeing the latter in terms of language and insisting on the essentially poetic nature of language can be traced back through the Romantics to Vico.

The contemporary American philosophers Richard Rorty (1989) and Stanley Cavell (1988) are among those who advocate a unity of philosophy and poetry. Rorty's glorification of the philosopher as 'strong poet' is basically Nietzschean, but, to safeguard liberal democracy, he insists that the philosopher's wilful, radically innovative poetic reconstructions be confined to the private sphere of self-creation. Cavell, more in the tradition of English Romanticism, thinks poetry and philosophy can redeem each other and the world, through a heightened recognition and celebration of ordinary experience. Recognizing their Romantic roots, these contemporaries turn to poetry as a model because they think that conceiving philosophy under the scientific model has made it

increasingly technical, but of extremely limited value for what they see as its central tasks of interpreting our lives and perfecting ourselves.

Poincaré, Jules Henri (1854-1912)

Although primarily a mathematician, Henri Poincaré wrote and lectured extensively on astronomy, theoretical physics, philosophy of science and philosophy of mathematics at the turn of the century. In philosophy, Poincaré is famous for the conventionalist thesis that we may choose either Euclidean or non-Euclidean geometry in physics, claiming that space is neither Euclidean nor non-Euclidean and that geometry is neither true nor false. However, Poincaré's conventionalism was not global, as some have claimed. Poincaré held that only geometry and perhaps a few principles of mechanics are conventional, and argued that science does discover truth, despite a conventional element.

Poincaré followed new developments in mathematics and physics closely and was involved in discussion of the foundations of mathematics and in the development of the theory of relativity. He was an important transitional figure in both of these areas, sometimes seeming ahead of his time and sometimes seeming very traditional. Perhaps because of the breadth of his views or because of the way in which philosophers focused on issues or small pieces of his work rather than on accurate history, interpretations of Poincaré vary greatly. Frequently cited by the logical positivists as a precursor, and widely discussed in the philosophy of science and the philosophy of mathematics, Poincaré's writings have had a strong impact on English-language philosophy.

1 Life and work

Henri Poincaré was born on 29 April 1854 in Nancy, France. His father was a physician and his cousin Raymond became president of the Third Republic during the First World War. Poincaré received his education at the Lycée of Nancy, and at the École Polytechnique and the École des Mines in Paris. He worked briefly as an engineer before obtaining his doctorate in mathematics in 1879, and after teaching for a short time at the University of Caen, in 1881 became a professor at the University of Paris, where he taught mathematical physics until his death on 17 July 1912. His mathematical work was extremely wide-ranging, and he is considered to be the last person able to make major contributions in all areas of mathematics. He also made important contributions to astronomy and theoretical physics, as well as to philosophy of science and philosophy of mathematics.

Poincaré's early mathematical work was in function theory, and before the age of thirty he became famous for his discovery of automorphic functions of one complex variable ('Fuchsian' functions). Poincaré's description of his discovery while entering a bus is quoted widely in discussions of scientific discovery: ' At the moment when I put my foot on the step the idea came to me, without anything in my former thoughts seeming to have paved the way for it, that the transformations I had used to define the Fuchsian functions were identical with those of non-Euclidean geometry' (1908, [1913b] 1982: 387-8).

Poincaré was awarded first prize for a contribution to a competition on the n-body problem, leading to his celebrated work in celestial mechanics (*Œuvres*, vols 7, 8). It was in this context that Poincaré proved his recurrence theorem that was influential in the development of chaos theory (see Chaos theory). He then worked in algebra and number theory, and eventually founded algebraic topology, a combinatorial theory of n-dimensional figures (*Œuvres*, vol. 6). Poincaré's lectures in mathematical physics at the University of Paris discussed a wide range of problems in turn-of-the-century physics, which he recognized to be a period of transition or even crisis (*Œuvres*, vols 9, 10). He also developed his conventionalism, claiming that there is no true metric geometry of space and that the choice of Euclidean or non-Euclidean geometry in physics is a matter of convenience (see Space §3; Geometry, philosophical issues in). There has been controversy over whether or not his contribution to the theory of relativity can be said to have anticipated Einstein's theory. Near the end of his life Poincaré became involved in discussion over the foundations of mathematics and developed an original solution to the semantic and set-theoretical paradoxes (see Paradoxes of set and property §9).

Poincaré published over 500 scientific papers and over thirty books. He was elected to the Académie des Sciences, the Légion d'Honneur and the Académie Française in France, as well as numerous foreign scientific and philosophical societies, and was awarded many prizes and honours. Interpreted as a total radical conventionalist, as an ultra-traditionalist or as inconsistent, Poincaré has been the source of continual discussion and comment by philosophers.

2 General philosophy of science

In 1890s France Poincaré had to face a popular climate decidedly hostile to science. While French philosophers turned away from Comte's positivism and Taine's materialist determinism towards the idealism of Henri Bergson, Poincaré became a popularizer of science and defended it against the attacks in vogue in the popular press, such as Tolstoi's argument that science is useless because it cannot tell us how to live, and the charge that science is 'bankrupt'. On the other hand, the long success of experimental science and the overturning of principles that were once held to be certain led Poincaré to think that rationalism was dead. The hypothetical method is the central feature of Poincaré's philosophy of science, and he considered it to be a middle ground between the dogmatic claims of the rationalist old guard and the contemporary anti-science views. A large motivation for his philosophical views seems to have been his desire to prove that science is cumulative and that the efforts of scientists in the past had not 'been sterile and vain', despite the great changes that were coming about in physics and mathematics (1905, [1913b] 1982: 280).

Poincaré distinguished three kinds of hypothesis: 'natural', 'indifferent' and 'real generalizations'. Natural hypotheses are first principles that are assumed a priori to be true. 'Indifferent hypotheses' is Poincaré's name for 'mechanical models' and refers to the nineteenth-century British tradition (of Faraday and Maxwell) of making a representation in a physical sense that provides a mechanical explanation of unobserved processes. Following a traditional form of usage (not one which Poincaré employed, however) we can refer to 'real generalizations' as fundamental laws, which should be contrasted with phenomenological laws that are taken directly from experience (see Laws, natural §1).

Poincaré is often read as an instrumentalist, one who holds that sciences should aim at giving an account of what is observable, not at explaining phenomena in terms of unobservable entities and processes (see Scientific realism and antirealism §1). Poincaré's view that the (metric) geometry of space is a matter of convention is often thought to be part of an instrumental view of all theoretical entities in science including space. However, Poincaré insisted that scientific theory is (or can be) true. In fact, Poincaré was involved in a dispute with Duhem over whether or not fundamental laws carry a truth-value. Duhem claimed that fundamental laws are neither true nor false because they are always approximate, a view that Poincaré rejected. Furthermore, while Poincaré explicitly denies the existence of atoms in *Science and Hypothesis* (1902a), arguing that the atomic hypothesis was useful but not the only possible explanation for chemical and other phenomena, he accepted their reality after he learned of the work of Perrin (Nye 1976), which shows that Poincaré had no general injunction against theoretical entities. In at least one case, Poincaré also accepted the refutation of a fundamental principle of physics, what he calls a 'natural hypothesis', by empirical theory. When he accepted the quantum theory as presented in the first Solvay conference in 1911, Poincaré gave up the hypothesis of continuity (McCormmach 1967).

3 Geometric conventionalism

Poincaré argued that we have no intuition of distance and therefore no a priori method of choosing an external standard to define distance. Furthermore, Poincaré argued that there is no spatial feature by which an external standard can be determined empirically and, therefore, alternative metrics are possible. Since statements about geometry cannot be determined a priori and cannot be determined empirically, they have a special status as conventions. Poincaré's geometric conventionalism has often been analysed in the context of later discussions of spacetime theories. The most widely promulgated argument for conventionalism is epistemological, and Poincaré's conventionalism has been thought by most interpreters to be based on an epistemological argument.

Poincaré presented two arguments that have been interpreted as defending conventionalism with epistemological arguments. In his famous parable of what measurement would be like in a non-Euclidean world, he introduces temperature as a 'distorting influence' on our measuring devices, which was taken to be an argument that one can always introduce a new hypothesis to account for data that contradicts one's theory. In other words, it has often been thought that Poincaré was using a version of the Duhem-Quine thesis (see Underdetermination §3) to defend conventionalism. However, the parable was part of an argument to prove that a non-Euclidean world is imaginable. Since a conventionalist must refute a priori arguments that space is Euclidean (such as Kant's), this argument plays an important role in the debate over conventionalism, but it may not be the whole story. Another of Poincaré's arguments that has been interpreted as epistemological concerns the definitions of primitive terms in physics. Lobatchevskii proposed using astronomical measurements to decide between Euclidean and non-Euclidean

geometry. In a passage that has been the subject of much controversy, Poincaré argued that the most such measurements can tell us is what ratios obtain between certain physical objects, in this case light rays. If one takes light rays to be straight lines, one is committed to a particular metric geometry by the results of empirical testing, but one could associate straight lines with some other physical object.

The problem with the epistemological interpretation of Poincaré's geometric conventionalism is that Duhemian underdetermination arguments establish his thesis too well. If we interpret Poincaré as using such an argument to defend his thesis of the conventionality of metric, it becomes difficult to understand how he could use such arguments in the case of metric only. If Poincaré did not deny the truth of physics in general, conventionality of metric cannot simply be a special case of a global underdetermination of theory by evidence.

An alternative defence of conventionalism bases geometric conventionalism on a fully relational theory of space. Poincaré went even further than current Einsteinian theories in rejecting Newtonian absolute space and held a purely relational view: there is no physical space and all of mechanics should be described in terms of the relations of physical objects (see Space §§2-3). These relations between physical objects are expressed in geometric terms but, according to Poincaré, any metric properties expressed in these relations are artifacts of our description. He thought that pure relationalism is empirically confirmed and that even acceleration and rotation can be treated as relative motions. Poincaré's physics is very programmatic, despite the fact that he followed developments in theoretical physics very closely and himself developed ideas for a theory of relativity that was close to that of Lorentz (Darrigol 1995). However, neither the special theory of relativity nor the general theory of relativity are relational in a sense that will support the conventionality of metric since relationalist theories of space cannot account for all spatial features without adding enough structure to determine a congruence standard (see Relativity theory, philosophical significance of).

Given that arguments for relationalism fail, one may agree with Sklar that the only way left to argue for conventionalism is the global underdetermination argument (Sklar 1974). While the epistemological interpretation of conventionalism provides a strong defence, it is not compatible with Poincaré's general views. The misrepresentation of Poincaré's philosophical views has made him look inconsistent, and inconsistency is arguably worse than holding a view that has been disconfirmed by empirical theory, which is all that is implied by interpreting Poincaré as basing his conventionalism on a relational theory of space.

4 Semantic conventionalism

The idea that conventionalism can be defended by changing the explicit definitions of terms has led to a semantic interpretation of Poincaré's views, especially his claim that Euclidean and non-Euclidean geometries are translatable. Poincaré often says that geometry is the language of physics and that we can translate a physical theory that uses Euclidean geometry into one that uses non-Euclidean geometry in much the same way as we might translate a French text on physics into German (Stump 1991: 640). Poincaré's claim that Euclidean and non-Euclidean geometries are translatable has generally been thought to be based on his introduction of a model to prove the consistency of Lobachevskian geometry and to be equivalent to a claim that Euclidean and non-Euclidean geometries are logically isomorphic axiomatic systems, but this interpretation is anachronistic because Poincaré never developed a formal conception of scientific theories. Interpreting conventionalism as part of a general semantic theory leads to the charge that it is trivial (trivial semantic conventionalism). For example, we could defend Poincaré's claim that physical bodies can be described as if they were in a strongly curved Lobachevskian space if we were to redefine 'rigidity' and postulate universal forces as distorting influences, but Poincaré specifically rejected such arguments when he distanced himself from É. Le Roy's interpretation of his conventionalism. Poincaré clearly intends his conventionalism to be more than a trivial change in notation.

Poincaré's translation thesis has a mathematical rather than a meta-mathematical basis. The mathematical basis of Poincaré's translation thesis is that the underlying manifolds of Euclidean and Lobachevskian geometries are homeomorphic (topologically equivalent). Assuming as Poincaré did that metric relations are not factual, it follows that we can rewrite a physical theory using Euclidean or Lobachevskian geometry to express the same facts. Because of his desire to prove that science is cumulative, Poincaré wrongly predicted that Euclidean geometry will always remain the preferred geometry in physics. He felt he could do so because his conventionalism would allow him to be able to rewrite in a Euclidean framework any experiment that seems to prove that the world is Lobachevskian.

5 Philosophy of mathematics

In the last years of his life, Poincaré became involved in discussions over the foundations of mathematics (1908). Concerning pure geometry, Poincaré holds the formalist-sounding views that we have no preaxiomatic understanding of geometric primitives, that rigour demands that we eliminate all appeals to intuition in geometry, and that pure (metric) geometry is neither true nor false. However, he takes quite a traditional position on arithmetic, holding that the axioms of arithmetic are synthetic a priori truths, that the notion of whole number is irreducible, and that we have a special intuitive knowledge of the fundamental principles of arithmetic - mathematical induction and the continuum. Poincaré takes an anti-Kantian view in geometry, since he accepts the consistency of non-Euclidean geometries and denies that we have any intuition of geometry, but in arithmetic Poincaré explicitly defends Kant's view that a special intuition of number is necessary against the claim of the logicists that arithmetic can be reduced to logic (see Kant, I. §5; Logicism). (Despite his explicit defence of Kant, Poincaré's idea of arithmetical intuition cannot be the same as Kant's, since he had argued earlier that we have no intuition of time, as well as no intuition of space.)

Poincaré criticized Russell's logicist programme by arguing that it is impossible to remove intuition from arithmetic. He argued that any proof of the principle of mathematical induction must rely on principles that cannot be purely logical, a critique of logicism that turned out to be correct. He also correctly predicted that it would be impossible to prove that arithmetic is consistent if one followed Hilbert's point of view in defining numbers by a system of axioms. His criticism of Hilbert and of Peano's axiomatization of arithmetic as not leading to true definitions of numbers may seem surprising, since Poincaré had praised Hilbert's work on geometry in a long review and even had adopted some of Hilbert's methods (Poincaré 1902b, 1904) (see Hilbert's programme and formalism §2).

Although Poincaré became involved in disputes over the foundations of mathematics mostly as a critic, he also developed a positive solution to the semantic and set-theoretical paradoxes in his discussion of impredicative definitions, which make use of a set of which the object to be defined is a member. He was one of the first to discuss a vicious circle principle and argued that the paradoxes can be solved if viciously circular impredicative definitions are not allowed. It is generally acknowledged that Poincaré's philosophy of mathematics is broadly speaking intuitionistic (seeIntuitionism §1). Besides his support of a Kantian view of arithmetic, Poincaré rejected the actual infinities of a realist interpretation of set theory. However, Folina (1992) has argued persuasively that Poincaré staked out a position between classical Platonism and intuitionism in the philosophy of mathematics by arguing that Poincaré's conception of the continuum is more classical than intuitionist.

Poland, philosophy in

Philosophy in Poland has developed largely along the same lines as its Western European counterpart. Yet it also has many aspects which are peculiar to itself. Historically, the founding of the University of Cracow in 1364 marks the formal beginning of Polish philosophy as an academic discipline: prior to this, philosophy was taught at numerous smaller schools, and many Poles were educated abroad, which accounts for the early influence of Western scholars and literature.

In the medieval period, philosophy in Poland followed four chronologically successive currents of thought: the via moderna, which attached itself to the nominalism of Ockham and his disciples; the via communis, which sought to find a compromise between the old ways and these new ideas; the via antiqua, which marked a return to earlier philosophical trends; and a period of early humanism. The thought of Aristotle became dominant during the fifteenth century, as was the case at practically all universities of Central and Western Europe, and although this prevailed until the eighteenth century, philosophy did not remain stagnant - variations were numerous (including Protestant Aristotelianism). The prominence of political thought in the sixteenth century reflects the fact that Poland developed a new constitutional order at this time, the 'democracy of nobles' (the nobility accounted for about ten per cent of the total population). Nicholas Copernicus, prominent in modern astronomy and natural science, played a fundamental role in the development of philosophy during this period.

The eighteenth-century Polish Enlightenment was shaped mainly by the clergy and hence was initially Christian in outlook. A more radical Enlightenment programme was propagated at a later stage. The following century saw the loss of Polish independence, and Polish thinkers were more prominent in exile than in their own country. At home, this coincided with a period of Romanticism and mystical philosophy ('Messianism'), with influences of Kant and particularly of Hegel. The end of the nineteenth century saw a variety of old and new philosophical orientations, ranging from medieval thought to positivism and Marxism, while 1895 saw the beginning of the Lwów School of philosophy which was to become prominent in the twentieth century.

After Polish independence in 1918, logic and methodology flourished under the influence of the Lwów School. However, elements of a variety of other Western schools of thought were also present, including that of British analytical philosophy. After the Second World War, administrative strictures were imposed in order to give prominence to Marxism. A certain liberalization took place after 1956, but its effects were dampened by a highly intrusive censorship. Despite this, philosophy in Poland continued to build upon the pre-Communist trends of Thomism and phenomenology, and to incorporate the new modes of thought emerging in the West. Since 1989-90, Marxism has lost its politico-administrative supports and censorship has disappeared, so that contemporary philosophy in Poland is entering a new phase of development.

1 The medieval period

Between the tenth and fifteenth centuries, philosophy in Poland developed in a manner akin to its Western European counterpart. It shared the same religious and metaphysical base, the same scholarly resources and the same school structure. Close contact was maintained with Western scholars, and so the influences on the development of philosophy were similar, facilitated by the widespread use of Latin. Nevertheless, Polish philosophy at this time also had its own defined peculiarities, especially in the fields of Practicism (and an accompanying interest in socio-political problems and in 'devotio moderna' - Mateusz z Krakowa (d. 1410), Jakub z Paradyża (d. *c*.1464) and others), an almost-universally accepted Concordism, an exceptional flourishing of Buridanism and a methodological emphasis on the separation of philosophy from theology (see Buridan, J.). Conciliarism was also prevalent. Several other disciplines flourished in Poland at this time, including law (which developed a *jus gentium* long before Grotius), science (in which Copernicus was educated) and historico-philological thought which gave birth to Polish humanism.

Poland's conversion to Christianity in 966 marked the beginning of the culture which bred this philosophy and learning. Schools possessing libraries with philosophical works were founded during the tenth to twelfth centuries, in conjunction with cathedrals and religious houses, and scholarly literature was imported from abroad. The first Polish chronicles were written by Gall. Anonim in the eleventh to twelfth centuries, and by the beginning of the fourteenth century, schools in Poland numbered in excess of 100. The liberal arts were widely taught and many

Poles were sent abroad to be educated, studying in Paris, Bologna, Montpelier and Padua.

Scholars of international stature emerged during the twelfth and thirteenth centuries, including Wincenty Kadłubek (d. 1223), the chronicler, lawyer and philosopher; Marcin Polak (d. 1278-9), author of the famous papal and imperial chronicles; Peregryn z Opola (d. after 1333), whose sermons were disseminated throughout Europe; and Witelo (d. *c*1290), whose philosophy, while concerned with anthropology, optics, demonology and the metaphysics of light, remained under Platonic and Neoplatonic influences while drawing from Chalcidius, Avicenna (see Ibn Sina), Alhazen (see Ibn Hazm) and Algazel (see al-Ghazali), among others. In the first half of the fourteenth century, many other philosophers and theologians with Polish connections received widespread recognition in ethics, anthropology, physics, metaphysics and logic. All came under the decisive influence of Aristotle and all assigned a subordinate role to philosophy in relation to theology.

The foundation of the University of Cracow by King Casimir the Great in 1364 marked the watershed in the history of medieval philosophy in Poland. Following its reform under the royal Jagiełło family (Jadwiga and Władysław) in 1400, the University became an important European centre of learning, and by the beginning of the fifteenth century, the so-called *via moderna* (associated with the nominalism of William of Ockham and his followers) developed dynamically there (see Nominalism. By the second half of that century, the search for compromise between *the via antiqua* and the *via moderna* gave birth to the so-called *via communis* (the 'common path'), following the rules of Concordism. Precursors of that path include Pihotr Wysz (d. 1414), a distinguished philosopher whose commentaries on the works of Aristotle have recently been rediscovered.

Among those who favoured the *via communis* position were the Cracow lawyers Stanisław z Skarbimierza (d. 1431) and Paweł z Włodkowic (d. after 1434). The latter's doctrines on just war theory and on political and religious freedom were a novelty in Europe and influenced subsequent Polish toleration during the period of the religious wars in the sixteenth and seventeenth centuries. Other advocates of the *via communis* include the two most important Polish philosophers of the first half of the fifteenth century, Pawełz Worczyna (d. *c*.1430) and Benedykt Hesse (d. 1456). Paweł's work in ethics is characterized by Practicism, while Hesse's commentaries on the works of Aristotle maintain a spirit of Buridanism modified by the influence of Londorius. The new physics developed by Hesse departs from Aristotle and introduces new concepts into natural science, such as the theory of impulse. In his great commentary on the Gospel of Matthew, Hesse addresses problems of ethics, asceticism, law and economics, resolving them in a spirit of pragmatism and practicality.

The second half of the fifteenth century also saw a brief revival of Neoplatonism, Thomism, Scotism, Averroism and Augustinianism. By the end of the century, however, explicit humanistic tendencies began to appear; among its chief advocates was the most famous of Polish scholars, Nicholas Copernicus.

2 The modern period

Owing to lively contacts with Italian centres of learning, the beginnings of Renaissance humanism were evident in Poland as early as the first half of the fifteenth century (see Humanism, Renaissance). Early humanism was characterized primarily by its literary character. The writings of Aristotle continued to be the basic texts in philosophical education in Poland. From the beginning of the sixteenth century, however, a renewed interest in ancient texts became widespread, and teaching and commentaries on Aristotle began to change noticeably. At the University of Cracow, Renaissance Aristotelianism prevailed under the influence of Jan Schilling (d. 1518) and Grzegorz za Stawiszyna (d. 1540) who both sought to explain Aristotle using Aristotle himself rather than scholastic commentary.

Humanism brought a philosophical method different from that of scholasticism, based on a broad range of ancient texts. Philosophy was now primarily regarded as an instrument for perfecting individuals as citizens and thus for perfecting society. The works of Erasmus of Rotterdam played a significant role in this process. However, the eclecticism of Renaissance philosophy became prevalent at the University of Cracow from the end of the second half of the sixteenth century (this model also dominated in the first fifty years of the influential Zamość Academy from its foundation in 1595). The curriculum began to incorporate a broader spectrum of ancient writings, including Plato, the Stoics, the Neoplatonists and St Augustine. Cicero was especially popular.

While particular emphasis was placed on practical disciplines, the most interesting results were achieved in logic. In his *Commentariorum Artis Dialecticae* (1563), for example, Jakub Górski (d. 1585) examines Stoic dialectics in

conjunction with Aristotle's logic, closely connecting logic and rhetoric. He discusses proofs with the help of probability arguments, limiting the discussion, however, to the most well-established proofs. Adam Burski (d. 1611) offers a rich anthology of ancient texts from the history of logic in his *Dialectica Ciceronis* (1604). It expounds on ancient dialectics, comparing and contrasting the logic of the Stoics with that of Aristotle.

The spirit of the Reformation, both positive and negative, prevailed in the extensive social and political writings which started in the 1540s. These were characterized by the fusing of religious and the political ideas. Republican and democratic currents of thought were decisively dominant, and the ideology of an absolute monarchy had few or no representatives in sixteenth-century Poland. Of the numerous political writers at this time, two expressed their views in the context of broader philosophical theories. Andrzej Frycz Modrzewski (d. *circa* 1572) was the author of the foundational work *De Republica Emendanda* (1551-4) which contained proposals for the reform of social customs, the law, the church, education and the army. Although a proponent of strong monarchy, he subordinated royal power to the rule of law, advocating that the king should be chosen by representatives of all classes. He proposed the creation of a criminal code which was to be binding on all and stressed the values of Christianity, while striving for union between Protestantism and Roman Catholicism. The resulting united Polish Church he envisaged as dependent on the king and on an ecumenical council which would exercise supreme power. Modrzewski's works were translated into several languages. In contrast to this his contemporary, Stanisław Orzechowski (d. 1566), identified Polish national traditions with Catholicism and stressed the importance of the clergy and the superiority of their way of life, thus inaugurating the Counter-Reformation in Polish political writing.

Poland was not unaffected by the rebirth of Thomism (and, to a lesser extent, Scotist philosophy) throughout Europe in the second half of the sixteenth century which was closely connected to the post-Tridentine reform movement in the Roman Catholic Church. At the turn of the seventeenth century, the Dominican and the Jesuit models of Thomistic philosophy as a commentary on Aristotle had become prevalent all over Europe. The former model, cultivated at the University of Cracow and the Zamość Academy, stressed the necessity of remaining faithful to the teachings of Thomas Aquinas, while the latter followed Suárez in emphasizing the need to update them, and was endorsed at the Jesuit-run Vilnius Academy. The Franciscans, meanwhile, philosophized in the spirit of John Duns Scotus.

A new dimension was added with the advent of Protestant Aristotelianism - Protestants did not have their own university in Poland, although they operated five schools where the level and range of philosophy taught was not fundamentally different from their university counterparts. (The Czech philosopher Comenius taught at one such school in Leszno from 1628 to 1656.) Political philosophy in the seventeenth century generally followed the republican-democratic trends of the previous century. However, absolute monarchy was advocated in some quarters.

The first half of the eighteenth century saw a continuation of the Scholastic Aristotelianism of the Dominicans and opposition to modern theories by figures such as Jerzy Gengel (d. 1730) and Adam Malczewski (d. 1754). By mid-century, however, characteristic perspectives of Enlightenment philosophy (the so-called *philosophia reccentiorum*) had penetrated Poland, primarily from Germany and Italy. This connected certain threads of Aristotelian philosophy with selections from Descartes, Gassendi, Locke, Newton and Leibniz. Epistemological and methodological concerns were primarily taken up in logic, limiting and sometimes even eliminating formal logic. Questions about world view (*Weltanschauung*) were prominent in metaphysics, while the teaching of natural law developed in ethics (see Natural law). The duty of taking part in social and political life was emphasized, as well as the essential role of Christianity in forming an authentic moral culture. Aristotelian philosophy of nature was limited or even abandoned in favour of the modern natural sciences. As the evolution and development of the Polish Enlightenment was carried out by the Catholic clergy, especially the religious orders and to a lesser extent the Protestant clergy, the typical anti-religious tendencies did not feature initially. By the end of the century, however, French and English influences had seeped through to inspire a more radical Enlightenment programme of rationalism, empiricism and naturalism (see Enlightenment, Continental).

3 The nineteenth and twentieth centuries

Until 1830, influences of the French Enlightenment, German Kantianism and the Scottish philosophy of 'common sense' continued to be the main traits identifiable in Polish philosophy (see Neo-Kantianism; Common Sense

School). Precursors of the Messianic philosophy which would dominate between the uprisings of November 1830 and January 1863 also appeared, marked by certain supra-national traits connected with Romanticism and post-Kantian German Idealism (see German idealism; Romanticism, German). These also possessed certain national characteristics that were part of Poland's religious and cultural traditions, and especially of its political and social situation as a nation deprived of statehood and sovereignty. General features of this Messianism include spiritualism, a highly personalized notion of the relationship between God and humans, and an orientation towards action and change - especially moral transformation of the person and the nation.

Most prominent at the time were Józef Maria Hoene-Wroński (d. 1854), who propounded a decidedly rationalistic philosophy, and August Cieszkowski (d. 1894) who represented the non-rationalistic side. Both systems, which had Neoplatonist orientations, were richer than Hegelianism by virtue of their theories of action and of the future. This was also the period of the so-called 'Catholic Philosophy' which, in Poland, often came closer to fideism and either was subject to Hegelianism or opposed to it. (Outside Poland, this philosophy came to be connected to neo-scholasticism.) Jewish philosophy developed in Poland during this period, influenced by Enlightenment rationalism and German Idealism. Its most prominent representatives included Mendel Lewin Satanower and Nachman Krochmal.

Positivism (as well as variations on Neo-Kantianism which came close to positivism) became widespread after 1863. This occurred not just as a result of the influence of Comte, J.S. Mill, Spencer and Bain, as well as scientism and Darwin's theory of evolution (see Darwin, C.): a domestic pre-positivistic tradition with roots in both the eighteenth century and Poland's politico-social conditions also entered the picture. Representatives of positivism during this period include Michał Wiszniewski (d. 1865) who also sympathized with the Scottish school (though he was not without Kantian influences). An English translation of his *Charaktery rozumów ludzkich (Sketches and Characters or the Natural History of Human Intellects)* was published in London in 1853. Within a broader understanding of positivism, Polish contributions are evident in the fields of scholarly research on mediumism (Investigations of problems concerning hypnosis and parapsychology - Julian Ochorowicz, d. 1935) and the methodology of medicine (Władysław Biegański, d. 1919). Representatives of other philosophical orientations of the late nineteenth and early twentieth centuries include Henryk Struve (d. 1912), an eclectic post-Hegelian scholar, and Wincenty Lutosławski (d. 1954), a proponent of the 'national philosophy' who was influential not so much for his spiritualistic metaphysics as his *Origin and Growth of Plato's Logic* (1897), a work on the chronology of Plato's corpus.

A new era of development began in Polish philosophy at the end of the eighteenth century, largely due to the 1895 appointment of Kazimierz Twardowski to the chair of philosophy at the University of Lwów, and to the establishment of the first specialized philosophical journal in Poland, *Przegląd Filozoficzny*, in Warsaw in 1897-8. The Lwów School (subsequently called the Lwów-Warsaw School) founded by Twardowski emphasized the use of detailed analysis, clear and precise philosophizing and inspired research in logic and methodology. (Notwithstanding certain common figures, one should distinguish the Lwów-Warsaw School of Philosophy from the Warsaw School of logic - which arose after 1918 - and the Warsaw School of mathematics.)

Many of Twardowski's students became prominent in their own right in the fields of philosophy, logic and psychology. Leopold Blaustein (d. 1944) was the author of many original works on descriptive psychology and was a pioneer in psychology pertaining to film and radio. Kazimierz Ajdukiewicz (d. 1963) produced important results in theory of language and logical analysis of the theoretical problems of cognition. His works, especially those published in *Erkenntnis* and in the Polish *Studia Philosophica* (along with Tarski's famous 1933 paper 'Pojęcie prawdy w językach nauk dedukcyjnych' - translated as 'The Concept of Truth in the Languages of the Deductive Sciences') influenced the development of the Vienna Circle and gave birth to logical semantics (see Tarski, A.; Vienna Circle). Czeżowski (d. 1981), another student of Twardowski, turned from formal logic to general theory of science and treated logic as learning in the general form of a science. Admitting various forms of immediate knowledge, he was a probabilist in terms of evaluating knowledge in relation to reality. Zawirski (d. 1948) also became prominent: he produced the book *L'évolution de la notion du temps* as well as various works in the philosophy of physics, multivalent and intuitionist logic and was a founder of causal logic (see Polish logic).

Other philosophical orientations were evident in interwar Poland. Empirical-critical thought was promoted by thinkers such as Władysław Heinrich (d. 1957), Narcyz Łubnicki (d. 1988) and Bolesław J. Gawecki (d. 1984).

Joachim Metallman (d. *c.*1942) was primarily interested in epistemology and methodology of the natural sciences. Leon Chwistek (d. 1944) pursued formal logic, searching for the logical system most compatible with nominalism which could simultaneously serve as a basis for metaphysics. He was also an artist and art theoretician. Władysław Tatarkiewicz (d. 1980) was distinguished in the history of philosophy, the history of aesthetics and art history. The style of philosophizing in his works on axiology is evocative of G.E. Moore and similar authors in analytic philosophy (see Axiology).

Benedykt Bornstein occupies a unique position in this era through his metaphysical speculation, connected as it was with logic and mathematics (known as geometric logic or 'topologic'). He linked pan-rationalism with accentuation of the foundational role of intellectual intuition. His last publications include *Geometric Logic* (1939), *Teoria absolutu. Metafizyka jako nauka ścisła (The Theory of the Absolute. Metaphysics as Science)* (1948). Roman Ingarden (d. 1970) promoted an objectivist version of phenomenology, thereby providing an alternative to the Lwów-Warsaw School and to minimalist analytical-positivist thought.

Notwithstanding the presence of several active representatives, Thomism in Poland before the Second World War possessed an eclectic and derivative character compared to Thomism abroad. The dominant influence came from the Louvain School, from whence came the founder and first rector of the Catholic University of Lublin (KUL), Idzi Radziszewski. Two important initiatives deserve note. First, the international project 'Corpus Philosophorum Medii Aevii' was founded at this time by Konstanty Michalski (d. 1947), a distinguished historian of philosophy and pioneer of the Thomistic philosophy of history. Second, on the occasion of the third Polish Philosophical Congress in Cracow in 1936, the project of the renewal of Thomistic philosophy and theology was formulated by what came to be known as the 'Cracow Circle'. This group of four opted to employ contemporary tools of logic. Their initiative was a novelty, even beyond Polish Thomism, and their aims were in part accepted at KUL after 1945.

Despite the loss of many promising academics and students during the Second World War, philosophy in Poland has been significantly active since that time. Having strengthened its political position, the ruling communist party sought to subordinate the whole culture to its Marxist ideology. However, despite many pressures and restrictions, the Communists never quite succeeded in eliminating non-Marxist orientations in Polish intellectual life. The traditions of the Lwów-Warsaw School continued in logic and in the methodology of the sciences. The objectivist phenomenology of Ingarden continued, at least in aesthetics and art theory, while at KUL, the Lublin School of existential Thomism developed. Polish thought passed through periods of Stalinism, Marxism, the Solidarity phase of 1980-1 and into the final breakthrough of 1989-90, which ended the domination of the Communist party.

4 Contemporary Polish philosophy

At the present time, philosophy in Poland represents a wide range of schools and perspectives. Phenomenology, Thomism, various schools of positivism and post-positivism, Marxism and the philosophy of dialogue (encounter) are all represented. The influences of Augustinianism, Hegelianism, hermeneutics and process philosophy can also be noted (see Hermeneutics; Process philosophy).

Phenomenology owes its position in Poland especially to Roman Ingarden, who continued to teach and whose thought flourished in Cracow after the Second World War. Notables among his students include Władysław Stróżewski, who connected phenomenology first with existential Thomism and later with certain elements of Platonism and Hegelianism in a 'dialectical phenomenology', and Józef Tischner who, in the end, departed far from the thought of his mentor. In phenomenological circles one also finds Karol Wojtyła (later Pope John Paul II), whose personalism combines the philosophy of being in the existentialist Thomistic spirit with the philosophy of subject in the spirit of classical phenomenology.

The primary centre of Thomistic philosophy is at the Faculty of Philosophy at KUL, and this philosophical orientation also prevails in the Faculty of Christian Philosophy at the Academy of Catholic Theology in Warsaw (Mieczysław A. Krąpiec, Stefan Swieżawski, Mieczysław Gogacz). Existential Thomism, borrowing from Gilson and Maritain while emphasizing the importance of the theory of being, supplies the intellectual framework, with the more traditional school of Thomism declining in prominence in recent years. At the Pontifical Academy of Theology (PAT) in Cracow, the philosophy of dialogue has been promulgated, while Andrzej Nowicki formulated a Marxist version of the philosophy of encounter ('inkontrologia'). PAT, under the banner of philosophy in

science, fosters a programme of interdisciplinary research (based upon identification and resolution of philosophical problems in the context of particular sciences) employing ideas from Platonism and from process philosophy. Since the death of Izydora Dąmbska in 1983, the Lwów-Warsaw School has been less prominent than in former years.

Marxism in Poland, although primitive, doctrinaire and Stalinist after the Second World War, later differentiated itself into various orientations. These have included humanist (invoking the young Marx), scientific (appealing to Engels), moderate, Leninist/revisionist, open Marxism (invoking modern scientific methodology and certain post-positivistic trends), and those who promoted a programme of eclectic 'universalism'. 'Individualistic' philosophers include Andrzej Grzegorczyk (a logician whose philosophy connects elements of scientism, existentialism and a Christian world view) and Jerzy Szymura (who defended a version of Hegelianism close to that of Bradley). Prominent Poles living abroad include Józef M. Bocheński (d. 1995) (following a Thomistic period, he later identified himself as an analytical philosopher who cherished the Aristotelian tradition), and Leszek Kołakowski who has changed from Marxist to critic of Marxism and whose current views can be characterized as a post-Hegelian, post-Marxist historicism and sociologism with a positivistic version of rationalism.

Polanyi, Michael (1891-1976)

Michael Polanyi was almost unique among philosophers in not only fully acknowledging but in arguing from the tacit dimensions of our knowledge which concern the many things which we know but cannot state nor even identify. He argued that our knowledge is a tacit, personal integration of subsidiary clues into a focal whole, and he elaborated this structure of knowing into a corresponding ontology and cosmology of a world of comprehensive entities and actions which are integrations of lower levels into higher ones. Polanyi used these accounts of knowing and being to argue against the 'critical' demands for impersonal, wholly objective and fully explicit knowledge, against reductionist attempts to explain higher levels in terms of lower ones, and to defend the freedom of scientific research and a free society generally.

1 Life

Michael Polanyi was born in Budapest into a distinguished Jewish family. He trained as a doctor but was primarily interested in research in chemistry. He was also active in support of liberal movements in Hungary but was sceptical of socialism. Opposed to the Bolshevik government in 1919 and distrusted by the Horthy regime which overthrew it, he left Budapest in 1919 and pursued a career in chemistry in Germany. In 1933 he emigrated to England and became Professor of Physical Chemistry at the University of Manchester. He made several visits to the Soviet Union, where a meeting in 1935 with Bukharin alerted him to Marxist proposals for the central planning of scientific research. He was already writing on economics and trying to articulate his ideas of a free society.

In 1948 he gave up his distinguished career in chemistry and was appointed to a non-teaching chair in Social Science in order to prepare his Gifford Lectures for 1951-2, which later became *Personal Knowledge* (1958), his most important book. In 1959 he became a Senior Research Fellow at Merton College, Oxford. Linguistic analysis, which was prevalent there, gave little support to his style of philosophy, but he attracted more attention in the USA, where he gave several series of lectures, published as *The Tacit Dimension* (1966) and *Meaning* (1975).

His philosophical work, in content and style, was never merely academic. Replete with examples, especially from natural science, it always addressed itself beyond purely philosophical questions to the social and political problems of the twentieth century. Every one of his books begins with some aspect of our present discontents, works back to their presuppositions, articulates a constructive alternative, and then indicates the new directions which thought, science and society should take.

2 Tacit integration

Polanyi is best known for his statement from *The Tacit Dimension*, 'We know more than we can tell' (1966: 4). From *Personal Knowledge* onwards, he gives many examples of such tacit knowledge. But his unique contribution to philosophy is his account of knowing as a tacit integration of subsidiary clues into a focal whole. Whereas phenomenology stresses that consciousness is intentional in that it is always consciousness *of* something, Polanyi shows that mind has a double intentionality: A attends from B to C (see Intentionality; Phenomenological movement). We attend *from* the subsidiary clues and to the focal whole. For example, a blind man using a stick does not pay attention to the impact of his stick upon his hand, but to the tip of the stick and what that tells him about what it touches. The sensations in the palm of his hand are subsidiary clues which he integrates into a focal awareness of the path and obstacles in front of him. If we switch our attention to the subsidiary clues, then sooner or latter we shall lose sight of the focal object to which we were attending. We attend from words to their meanings, and by repeatedly pronouncing a word we forget what it means. We can regain its meaning only by using it. This relation of subsidiary details and clues to the focal whole is a functional one. We use the clues or details to apprehend or perform the focal whole. Subsidiary awareness is therefore more than merely subconscious or fringe awareness. Furthermore, what we attend to can itself become a subsidiary clue used in attending to something else, as when learning to play the piano we first attend to our fingers, and then from them to the music to be played.

Polanyi shows that these integrations pervade all our knowledge, and not just perception. They control our use of language, which can never be rendered exact and precise. Because we always attend from some set of subsidiary clues, we can never make our knowledge wholly focal. Therefore we can never make it wholly explicit and

articulate, nor subject it to a complete critical scrutiny. It must always rest upon the tacit and therefore acritical foundations of personal judgment and commitment. The objectivist ideal of a fully tested, detached, impersonal and 'objective' knowledge cannot be met. But knowledge is 'personal' and not 'subjective'. It is attention away from ourselves to a world that anchors our commitments. Reality outruns our conceptions of it and shows itself in ways that we cannot anticipate (see Tacit knowledge).

We use as subsidiary clues details of the object known, its context and ourselves. The object known is itself a comprehensive entity, or complex performance, in which details on a lower level are integrated by the principles of operation of the next higher level which determine the boundary conditions left open by the operational principles of the lower level. In attending from its subsidiary details, we re-perform, as it were, its own internal integration. Our own bodies are primarily what we use and so attend *from*, in knowing and acting within the world. We indwell them. Likewise, by extension, we indwell the objects that we know. As the blind man incorporates his stick into his body by indwelling it, so we incorporate our acquired knowledge, ideas and frameworks into our minds by indwelling them. Polanyi bridges the Cartesian gap between the self and an 'external world' with the indwelling of tacit integration (see Dualism).

Polanyi described his philosophy as a 'post-critical' and 'fiduciary' one, which aims to enable us explicitly to hold beliefs which we know might be false. As against the 'critical' attempt to apply the method of doubt and to reject whatever cannot be proved, it seeks to articulate the ultimate beliefs which are presupposed by our proximate ones and practices. The premises of science, for example, are embodied and tacitly known in the practice of scientific research. From results which we already accept as true and methods which we already hold to be valid we can try to articulate the principles and beliefs which they presuppose. We cannot start with the latter and use them to justify the former (see Merleau-Ponty, M.).

3 Applications

Polanyi applied his account of tacit integration in knowing and being to many topics, such as the relation between language and meaning, the structure of a work of art, the refutation of various reductionisms, the relation of body and mind, the nature of discovery, and the role of tradition in conveying tacit knowledge. His distinctive philosophy of science emphasizes the roles of the personal factors of belief, passionate engagement, imagination and authority, as against supposedly exact and impersonal observations and procedures, and denies the conventional distinction between 'discovery' and 'justification'. For what science aims at is truth, and not just trivial truths, but scientifically valuable ones. No random generation of problems and hypotheses can guide it, only the trained but tacit sense of the scientist for what is significant, probable and discoverable by himself with the means at his disposal. For example, it is a matter of judgment as to whether discrepant observations can be ignored as inevitable error, left to be cleared up later, or taken to require a revision of current theory (see Scientific method).

In his political and economic theory Polanyi argued that 'objectivist' assumptions have undermined our ability to uphold our personal commitments to intangible ideals. Totalitarian systems, such as Marxism, take advantage of this to discredit moral ideals and freedom, and disguise, in supposedly objective predictions of the future course of history, their own calls for centralized power to attempt a total renewal of society. Scepticism is no longer sufficient to combat destructive ideologies. A free society is one that is dedicated to transcendent ideals such as truth, justice and charity and not one that is 'open' to all ideologies. Its freedom is principally the 'positive' one to serve those ideals. But science, the economy and other activities of human life cannot be centrally planned. They manifest the spontaneous order of the mutual adjustment of individual elements.

Polanyi argued against the dichotomy of fact and value. The activities of life and mind have their own internal standards. To know them, we must grasp and apply those standards and recognize relevant entities and events as 'achievements', realizations of those standards, which cannot be neutrally described nor be apprehended by detached observation.

Polish logic

The term 'Polish logic' was coined by McCall to signal the important contributions to modern logic by logicians from Poland between the wars. There were several centres of research, of which the Warsaw school, which grew out of the earlier Lwów-Warsaw philosophical movement, was the most significant. Its development was closely connected with the Warsaw school of mathematics, which gave it its characteristic mathematical bent.

Polish logic took as its point of departure the main trends in logical research of the time and it has influenced both subsequent logical research and subsequent work in the Western analytic tradition of philosophy. Its chief contributions were: (1) an enrichment of existing logical theory (including work on Boolean algebras, the sentential calculus, set theory, the theory of types); (2) new logical theories (for example, Leśniewski's systems, Łukasiewicz's many-valued logics, Tarski's theory of truth, theory of the consequence operation and the calculus of systems); (3) new methods and tools as well as improvements of existing methods (for example, the matrix method of constructing sentential calculi, axiomatizability of logical matrices, algebraic and topological interpretations of deductive systems, permutation models for set theory, the application of quantifier elimination to decidability and definability problems); and (4) the application of formal methods to the study of the history of logic, resulting in a new understanding of the logics of Aristotle, the Stoics and the medievals.

1 Historical introduction

In 1918, after 120 years of subjugation by foreign powers, Poland reappeared on the map of Europe as a free and independent nation-state. In 1939 the outbreak of the Second World War reversed these brief gains, bringing down the curtain on the Second Republic and inflicting massive damage on its economy, culture and learning. The main centres of logic research between these dates were Cracow, Lwów, Poznan, Wilno and, most importantly, Warsaw. The Warsaw school of logic, founded by Łukasiewicz and Leśniewski, began as an intellectual offshoot of the Lwów-Warsaw philosophical movement, but quickly eclipsed it in both quantity and quality of research.

The development of the Warsaw school of logic was closely connected with that of the Warsaw school of mathematics. In 1918 one could already speak of Warsaw as a fairly strong centre of research in set theory and topology under the direction of Janiszewski, Mazurkiewicz and Sierpiński. The two schools shared organizational structures, swapped directors and collaborated on many academic initiatives. This accelerated the development of both schools and deepened their research in key areas. In later years Kuratowski, Lindenbaum, Tarski and finally Mostowski made significant contributions to both schools.

2 Łukasiewicz: sentential calculi and history of logic

Łukasiewicz's more philosophical research culminated in his study of the principle of contradiction in Aristotle (1910), which was an important influence on the development of logic in Poland. After his discovery of a 'non-Aristotelian' many-valued logic (1918-20; see Łukasiewicz, J. §3), he turned to the study of the logic of propositions - in particular, to the sentential calculus, which he believed to be the simplest deductive discipline central to all scientific reasoning, and around which he built a research programme which served as a focus for research work on propositional logics throughout Poland (see Łukasiewicz 1941).

Łukasiewicz's programme can be seen as divided into two periods. The first, up to 1930, is characterized by conceptual and foundational achievements (see Łukasiewicz and Tarski 1930; Łukasiewicz 1929).

Notable among the conceptual achievements are a definition of a recursive grammar for propositional languages (including propositional quantifiers); the now famous bracket-free notation known as Polish notation; a precise definition of the syntactic operations of substitution and replacement; a new axiom system for classical propositional logic together with a new completeness proof for this system; formulations of several systems of many-valued logic (see Many-valued logics, philosophical issues in); a rigorous distinction between considerations of syntax and proof theory, on the one hand, and metalogical and semantic considerations on the other; and the invention of the matrix method of constructing sentential calculi.

Among the foundational achievements are various technical results in the search for single-sentence axiomatizations (notably by Tarski), Wajsberg's discovery of a criterion for finite axiomatizability, Lindenbaum's

theorem on the existence of adequate matrices for arbitrary systems of propositional logic closed under substitution, and pioneering studies of partial calculi (for example, the pure implicational and the pure equivalential fragments of classical sentential logic) and of sentential calculi extended by propositional quantifiers and variable functors of higher order.

The second period, from 1931 on, is characterized by the expansion of the programme to cover a greater number of propositional calculi, and its enrichment with new methods drawn from algebra and topology.

Noteworthy results of this period include a complete algebraic semantics for Lewis' S5 (see Wajsberg 1933), Jaśkowski's invention - independently of Gentzen - of the idea of a system of natural deduction (see Jaśkowski 1934; Natural deduction, tableau and sequent systems §1), a complete algebraic semantics for intuitionistic logic (Jaśkowski 1936), a topological interpretation of certain sentential calculi, notably the intuitionist variant (Tarski 1956), and a proof of the separability of the intuitionist connectives (Wajsberg 1938).

Still, a great deal of research in this period continued to be devoted to finite logical matrices. Wajsberg (1935), Sobociński (1936) and Słupecki (1939a) worked on solutions to the axiomatizability problem for many-valued logics. Słupecki (1939b) found a criterion for functional completeness of finite algebras.

Łukasiewicz also founded a programme of historical research whose goals were both a thorough exegesis and an analytical reconstruction of ancient and medieval logic. The source of this programme was his own book on Aristotle (1910), which distinguished ontological, logical and psychological formulations of the principle of contradiction. Łukasiewicz himself traced the historical roots of propositional logic to Stoic dialectic and countered prevailing views of the Middle Ages by shedding new light on the importance of the achievements of Petrus Hispanus and Duns Scotus (1934); he provided an axiomatic reformulation of Aristotle's syllogistic (1929, 1939, 1951; Logic, ancient §7). In the course of these investigations, Łukasiewicz introduced a new formal idea: the concept of a 'rejection system' - a Hilbert-type system for disproving rather than proving formulas - which he intended as a syntactic counterpart to the semantic device of refutation. This idea was subsequently elaborated by Słupecki (1949).

Under Łukasiewicz's influence a number of scholars outside Warsaw undertook related research. In Wilno, Czeżowski (1936) studied the treatment of modal sentences in Aristotle and Korcik (1937) provided an interpretation of some of Aristotle's writings in terms of a theory of the conversion of assertoric sentences. Bocheński (1938) wrote a history of the treatment of modal sentences in ancient and medieval times. In Poznan, Jordan (1937) studied the use of the axiomatic method from Plato and Eudoxus to Euclid's *Elements*. In Cracow, Salamucha analysed Saint Thomas' *ex motu* proof of the existence of God (1934), showed that William of Ockham had anticipated large parts of classical propositional calculus (1935) and wrote a scholarly treatise on medieval antinomies (1937).

Łukasiewicz's programme revealed that ancient and medieval logicians had considered 'formal' problems similar in character to some of the problems addressed by contemporary formal logic. This prompted a new interest in the subject and eventually led to a critical re-evaluation of large parts of the history of logic (see Scholz 1931; Łukasiewicz 1951; Mates 1953; Bocheński 1951, 1956; Kotarbiński 1957).

3 Leśniewski: foundations of mathematics

The main goal of Leśniewski was to provide a foundation for mathematics that would yield a real understanding of the antinomies and not simply avoid them. He did not accept the principles and assumptions of Cantorian set theory, regarding them as artificial and counterintuitive. He found the notion of an empty set an affront to reason. He was suspicious of *Principia Mathematica* on the grounds that its formalism was careless, ambiguous and did not pay sufficient attention to the use/mention distinction. He was an uncompromising critic of formalism for formalism's sake, and sought to ground mathematics in extensionalism, constructive nominalism and two-valued logic, insisting that only these principles would assure that it expressed meaningful, true sentences about the real world. He was, in the words of Tarski, the first person to become fully aware that a language which contains its own semantics and within which the usual logical laws hold must inevitably fall prey to liar-type paradoxes and hence be inconsistent.

The cornerstones of Leśniewski's work are *Mereology* (1927-31, outlined in 1916), *Ontology* (1920), his theory of

semantic categories (1929) and *Protothetic* (1929) (see Leśniewski 1929). The notion of a semantic category, due originally to Husserl, plays a role in Leśniewski's construction of formal theories similar to that played by the notion of type in *Principia Mathematica*. Ajdukiewicz later reformulated the theory of semantic categories in the form of a calculus (see Ajdukiewicz, K. §5; Ajdukiewicz 1978, article 7).

Constructive nominalism had important metalogical consequences for Leśniewski, confronting him with problems of how to describe a system, its language, axioms and rules (especially rules of definition). Notoriously, he clung to the belief that at any particular moment a logical system contains only as many theorems as have been proved up to that point in time. This led him to an extreme constructivism in the theory of definitions. Definitions in his system were 'creative', that is, after introducing definitions of new terms, the system was, in his sense, stronger than before. His definitions can thus not be regarded as mere abbreviational conveniences.

Tarski, in his 1924 doctoral dissertation under Leśniewski, investigated a fragment of *Protothetic* which might be called the second-order propositional calculus. He showed that in this system all sentential functors can be defined in terms of the equivalence connective and universal quantifier; and that one can prove counterparts to all the basic metalogical laws for classical propositional calculus. These results supported Leśniewski's conviction that metatheoretical considerations outside the system were dispensable.

Mereology influenced Tarski in his papers on solid geometry and Boolean algebras, and also found application in Woodger and Tarski's work on the axiomatic foundations of biology (see Woodger 1937). Sobociński (1934) published successive simplifications of the axiom system for *Ontology*. Kotarbiński's philosophy of reism, and his classic *Elements* (1929), owe much to the ideas of Leśniewski.

Leśniewski's influence spread chiefly through lectures and seminars. He was unquestionably one of the founding fathers of logic in Poland between the wars. Only after the Second World War, through some of his students' publications and a monograph by Luschei (1962), did the wider community take an interest in his achievements (see Srzednicki, Rickey and Czelakowski 1984). Some notes from his Warsaw lectures were collected and published in 1988.

4 Tarski: semantics and metamathematics

The role of Tarski in the development of Polish logic was in every way exceptional. Up to 1939 he published about sixty research papers covering various aspects of logic, set theory, measure theory (including the famous Banach-Tarski theorem on the 'paradoxical' decomposition of the sphere), axiomatic and structural aspects of Boolean algebras, truth theory and other areas of semantics (see Tarski 1956).

Tarski's contributions in pure logic were outstanding, and his work in formal or 'scientific' semantics and metamathematics helped shape Polish logic. His signal achievement was to establish that, for languages with specifiable structure, semantic notions such as satisfiability, truth, consequence and definability could be treated mathematically, and that this was fruitful (see Tarski's definition of truth; Consequence, conceptions of; Model theory).

A metamathematical theme was present in Polish logic from the early 1920s, beginning with Ajdukiewicz (1921). Tarski's efforts allowed investigations of the sentential calculi to be carried out within an explicitly metamathematical framework. Tarski generalized this framework to a mathematical theory of two primitive concepts (sentence and consequence) which he called 'the methodology of the deductive sciences'. Within this theory he was able to provide a conceptual apparatus for investigating deductive systems. (Lindenbaum contributed much to this work, including the widely known Lindenbaum maximality lemma.) Tarski later enlarged his metamathematics to encompass the calculus of systems and the concepts of ω-consistency and ω-completeness. These contributions were of a foundational nature, explicitly concerned with metatheory *per se*, and consciously framed in a meta-metalanguage. (See Tarski 1956.)

One of Tarski's best-known discoveries is the 1930 theorem on the eliminability of quantifiers for the theory of real closed fields, together with its consequences for the decidability of the arithmetic of real numbers and elementary geometry, and the definability of sets of reals. To this category also belongs Tarski and Mostowski's work of the late 1930s on the decidability of the theory of well-orderings.

A recurring motif in Tarski's work was the idea of algebraization. He believed that by abstracting an algebraic

calculus from a theory, the tools developed for the theory could be extended to other disciplines. This idea exerted a far-reaching influence on the subsequent course of logical investigations in Poland and elsewhere.

Largely through Tarski's work on truth, Polish logic also influenced philosophy. He spoke out against allowing one's repertoire of methods to be constrained by philosophical 'isms' such as formalism, logicism, constructivism or intuitionism (though his own scientism was exempt), and urged free use of all the resources of set theory, including transfinite techniques. He never accepted Wittgenstein's thesis that there is only one language of philosophical and scientific discourse, and persuaded some members of the Vienna Circle (most notably Carnap) to set it aside as well (see Tarski 1992).

5 Other work

Four recurring themes characterized the work of the Warsaw set theorists: (1) the axiom of choice, its equivalents and various weakenings, and its role within and beyond set theory; (2) the continuum hypothesis, its role in mathematics and its relation to the axiom of choice; (3) the problem of the independence of the axiom of choice from other principles of set theory; and (4) the arithmetic of cardinal and ordinal numbers (see Axiom of choice; Set theory).

Sierpiński's paper (1918) was the first major contribution to (1). He argued that before an informed decision could be made concerning whether to adopt the axiom of choice, one should first investigate its deductive strength. In 1924, Tarski discovered that several statements in the arithmetic of infinite cardinals were equivalent to the axiom of choice and also systematized the theory of finite sets and showed that it was necessary to assume the axiom of choice to prove the equivalence of various definitions of finiteness (see Tarski 1986: vol. 1, 39-48, 65-117). Lindenbaum was the first to pose the question 'What is the logical relation between the continuum hypothesis and the axiom of choice?'. These and related results were summarized in a 1926 paper by Lindenbaum and Tarski (see Tarski 1986: vol. 1, 171-204), where the two authors famously stated, without proof, that the generalized continuum hypothesis implies the axiom of choice (188, theorem 94). In 1934, Sierpiński published a compendium of principles known to be consequences of the generalized continuum hypothesis, but it was not until 1947 that he was able to supply the missing proof (1976: 485-8).

In 1938 Mostowski investigated the independence of definitions of finiteness in a system of type theory by means of the method of relativization of quantifiers (see Mostowski 1979: vol. 2, 18-67). During the years 1935-8 he and Lindenbaum also refined and extended Fraenkel's permutation models to investigate the independence of the axiom of choice from the ordering principle and various weaker forms of the axiom (vol. 1, 290-338; vol. 2, 70-4).

In Cracow, Sleszyński published a survey of the development of formal logic from Aristotle to Russell and Whitehead. Especially valuable is his treatment of nineteenth-century mathematical logic (1925-9). W. Wilkosz wrote textbooks on modern set theory and axiomatic foundations of number theories.

Chwistek developed a system for the foundation of logic and mathematics. Starting from several improvements of the ramified theory of types (see Theory of types), he arrived at a purely constructivist theory without the axioms of reducibility and extensionality and without impredicative definitions (1924-5). Later, with his pupils J. Herzberg and W. Hetper, he outlined a formal theory of expressions called 'rational metamathematics' (1935). Chwistek's work in logic was strongly influenced by his philosophical beliefs, which set him apart from the mainstream of Polish logic (1961-3).

Pepis (1937, 1938) investigated the decision problem for the predicate calculus; more specifically, he dealt with the problem of reducing the question of the satisfiability of a logical formula from the general case to that of a formula having a special normal form.

6 Post-war developments

The Second World War caused the deaths of many logicians, including Lindenbaum and his wife J. Hosiasson-Lindenbaum (who worked on inductive logic), Herzberg, Hetper, Pepis, Salamucha, Z. Schmierer and Wajsberg. Others were forced to emigrate: Bocheński, H. Hiż, Jordan, Łukasiewicz, H. Mehlberg, Sobociński and Tarski. Manuscripts were lost or destroyed, among them Łukasiewicz's manuscript for a book on syllogistic, Mostowski's notes on the proof of quantifier elimination for well-orderings, and Leśniewski's *Nachlaß*. Galley

proofs of a new journal, *Collectanea Logica*, were destroyed in 1939 and the journal never appeared.

Post-war Polish logic picked up where pre-war work had left off. In mathematical logic and the foundations of mathematics, the main figure was Mostowski (1979), whose contributions were wide-ranging, along with A. Grzegorczyk, A. Erenfeucht, J. Łoś, C. Ryll-Nardzewski and R. Suszko. Łośis best known for his 1954 notion of categoricity-in-power, his 1955 lemma on ultraproducts and generally for his work on model theory (parts of which were carried out in collaboration with Suszko). Ryll-Nardzewski contributed to model theory (omitting types and ω-categoricity) and arithmetic (showing first-order Peano arithmetic is not finitely axiomatizable). Together, Łośand Ryll-Nardzewski shed light on the logical importance of Tychonoff's compactness theorem and the prime ideal theorem. Joint papers by Grzegorczyk, Mostowski and Ryll-Nardzewski (see Mostowski 1979: vol. 1, 371-89; vol. 2, 427-31) are important for our understanding of natural numbers and ω-logic. Mostowski's expository essays and surveys have influenced the wider philosophical community (see Mostowski 1952, 1955, 1965).

Tarski's ideas of the algebraization of logic and of metamathematics were elaborated in numerous papers by Rasiowa and Sikorski and culminated in a classic work, *The Mathematics of Metamathematics* (1963).

In 1958 Łośand Suszko proposed applying Tarski's theory of the consequence operation to investigations of abstract sentential calculi. This became a research paradigm of post-war Polish logic, drawing on concepts and tools from contemporary model theory and universal algebra. Its principal contributors were J. Czelakowski, W. Dziobak, W.A. Pogorzelski, T. Prucnal, Suszko, P. Wojtylak, R. Wójcicki and A. Wroński. Wójcicki (1987) summarizes the most important results of this programme.

The following logical journals were established in Poland after the Second World War: *Studia Logica* (in 1953), *Bulletin of the Section of Logic* (in 1972), *Reports on Mathematical Logic* (in 1973) and *Logic and Logical Philosophy* (in 1993). An account of post-war Polish logic can be found in Wójcicki (1997) and that of the foundations of mathematics in Marek (1977).

7 Polish notation

In Polish logical notation all operators are placed before the variables over which they have scope.

Np	Negation ($\neg$)
Kpq	Conjunction ($\wedge$)
Apq	Weak or inclusive disjunction ($\vee$)
Jpq	Strong or exclusive disjunction, or non-equivalence ($\not\equiv$)
Cpq	Conditional ($\rightarrow$)
Epq	Biconditional ($\leftrightarrow$)
Dpq	Sheffer stroke or non-conjunction ($\mid$)
Πpq	Universal quantification ($\forall$) (of q with respect to the sentential variable p)
Σpq	Existential quantification ($\exists$) (of q with respect to the sentential variable p)
ΠxFx	Universal quantification (of Fx with respect to the individual variable x)
ΣxFx	Existential quantification (of Fx with respect to the individual variable x)

Because we know for each operator whether it is one-place or two-place, we know how many of the following letters fall within its scope. So parentheses are not required to avoid ambiguity or to show association. For example, $p \rightarrow (q \rightarrow r)$ is written *CpCqr* and $(p \rightarrow q) \rightarrow r$ is *CCpqr*; and

$((p \wedge q) \rightarrow \neg r) \rightarrow (r \rightarrow (\neg p \vee \neg q))$

is *CCKpqNrCrANpNq*.

The parenthesis-free notation, later called Polish notation, was invented by Łukasiewicz in 1924 and published (1929) in application to the sentential calculus, the sentential calculus with quantifiers and Aristotle's syllogistic. (See also Łukasiewicz and Tarski 1930: 39, note 2; 54-.) The notation is very convenient in theoretical considerations; sometimes it is also used in textbooks (see, for example, Prior 1955).

Political philosophy

Political philosophy can be defined as philosophical reflection on how best to arrange our collective life - our political institutions and our social practices, such as our economic system and our pattern of family life. (Sometimes a distinction is made between *political* and *social* philosophy, but I shall use ‘political philosophy’ in a broad sense to include both.) Political philosophers seek to establish basic principles that will, for instance, justify a particular form of state, show that individuals have certain inalienable rights, or tell us how a society’s material resources should be shared among its members. This usually involves analysing and interpreting ideas like freedom, justice, authority and democracy and then applying them in a critical way to the social and political institutions that currently exist. Some political philosophers have tried primarily to justify the prevailing arrangements of their society; others have painted pictures of an ideal state or an ideal social world that is very different from anything we have so far experienced (see Utopianism).

Political philosophy has been practised for as long as human beings have regarded their collective arrangements not as immutable and part of the natural order but as potentially open to change, and therefore as standing in need of philosophical justification. It can be found in many different cultures, and has taken a wide variety of forms. There are two reasons for this diversity. First, the methods and approaches used by political philosophers reflect the general philosophical tendencies of their epoch. Developments in epistemology and ethics, for instance, alter the assumptions on which political philosophy can proceed. But second, the political philosopher’s agenda is largely set by the pressing political issues of the day. In medieval Europe, for instance, the proper relationship between Church and State became a central issue in political philosophy; in the early modern period the main argument was between defenders of absolutism and those who sought to justify a limited, constitutional state. In the nineteenth century, the social question - the question of how an industrial society should organize its economy and its welfare system - came to the fore. When we study the history of political philosophy, therefore, we find that alongside some perennial questions - how can one person ever justifiably claim the authority to govern another person, for instance? - there are some big changes: in the issues addressed, in the language used to address them, and in the underlying premises on which the political philosopher rests his or her argument. (For the development of the Western tradition of political philosophy, see political philosophy, history of; for other traditions, see Political philosophy in classical Islam; Political philosophy, Indian; African philosophy, Anglophone; Marxism, Chinese; Bushi philosophy; Shōtoku constitution; Sunzi; Marxist thought in Latin America.)

One question that immediately arises is whether the principles that political philosophers establish are to be regarded as having universal validity, or whether they should be seen as expressing the assumptions and the values of a particular political community. This question about the scope and status of political philosophy has been fiercely debated in recent years (see Political philosophy, nature of). It is closely connected to a question about human nature (see Human nature). In order to justify a set of collective arrangements, a political philosophy must say something about the nature of human beings, about their needs, their capacities, about whether they are mainly selfish or mainly altruistic, and so forth. But can we discover common traits in human beings everywhere, or are people’s characters predominantly shaped by the particular culture they belong to?

If we examine the main works of political philosophy in past centuries, they can be divided roughly into two categories. On the one hand there are those produced by philosophers elaborating general philosophical systems, whose political philosophy flows out of and forms an integral part of those systems. Leading philosophers who have made substantial contributions to political thought include Plato, Aristotle, Augustine, Aquinas, Hobbes, Locke, Hume, Hegel and J.S. Mill. On the other hand there are social and political thinkers whose contribution to philosophy as a whole has had little lasting significance, but who have made influential contributions to political philosophy specifically. In this category we may include Cicero, Marsilius of Padua, Machiavelli, Grotius, Rousseau, Bentham, Fichte and Marx. Two important figures whose work reflects non-Western influences are Ibn Khaldhun and Kauṭilya. Among the most important twentieth-century political thinkers are Arendt, Berlin, Dewey, Foucault, Gandhi, Gramsci, Habermas, Hayek, Oakeshott, Rawls, Sartre and Taylor.

1 Political institutions and ideologies

What are the issues that, historically and today, have most exercised political philosophers? To begin with, there is a set of questions about how political institutions should be arranged. Today we would think of this as an enquiry into the best form of state, though we should note that the state itself is a particular kind of political arrangement of relatively recent origin - for most of their history human beings have not been governed by states (see State, the). Since all states claim Authority over their subjects, two fundamental issues are the very meaning of authority, and the criteria by which we can judge forms of political rule legitimate (see Legitimacy; Contractarianism; General will; Power; Tradition and traditionalism). Connected to this is the issue of whether individual subjects have a moral obligation to obey the laws of their state (see Obligation, political), and of the circumstances under which politically-inspired disobedience is justifiable (see Civil disobedience; Revolution). Next there is a series of questions about the form that the state should take: whether authority should be absolute or constitutionally limited (see Absolutism; Constitutionalism); whether its structure should be unitary or federal (see Federalism and confederalism); whether it should be democratically controlled, and if so by what means (see Democracy; Representation, political). Finally here there is the question of whether any general limits can be set to the authority of the state - whether there are areas of individual freedom or privacy that the state must never invade on any pretext (see Law, limits of; Freedom of speech; Coercion; Property; Slavery), and whether there are subjects such as religious doctrine on which the state must adopt a strictly neutral posture (see Neutrality, political; Toleration).

Beyond the question of how the state itself should be constituted lies the question of the general principles that should guide its decisions. What values should inform economic and social policy for instance? Part of the political philosopher’s task is to examine ideas that are often appealed to in political argument but whose meaning remains obscure, so that they can be used by politicians from rival camps to justify radically contrasting policies. Political philosophers try to give a clear and coherent account of notions such as Equality, Freedom and liberty, Justice, Needs and interests, Public interest, Rights and Welfare. And they also try to determine whether these ideas are consistent with, or conflict with, one another - whether, for instance, equality and liberty are competing values, or whether a society might be both free and equal at once.

Further questions arise about the principles that should guide one state in its dealings with other states. May states legitimately pursue what they regard as their national interests, or are they bound to recognize ethical obligations towards one another (see Development ethics)? More widely, should we be seeking a cosmopolitan alternative under which principles of justice would be applied at global level? (see International relations, philosophy of; Justice, international). When, if ever, are states justified in going to war with each other? (See War and peace, philosophy of.)

Over about the last two centuries, political debate has most often been conducted within the general frameworks supplied by rival ideologies. We can think of an ideology as a set of beliefs about the social and political world which simultaneously makes sense of what is going on, and guides our practical responses to it (see Ideology). Ideologies are often rather loosely structured, so that two people who are both conservatives, say, may reach quite different conclusions about some concrete issue of policy. Nevertheless they seem to be indispensable as simplifying devices for thinking about a political world of ever-increasing complexity.

No political philosopher can break free entirely from the grip of ideology, but political philosophy must involve a more critical scrutiny of the intellectual links that hold ideologies together, and a bringing to light of the unstated assumptions that underpin them. The most influential of these ideologies have been Liberalism, Conservatism, Socialism, nationalism (see Nation and nationalism; Eurasian movement; Pan-Slavism; Zionism; Pan-Africanism) and Marxism (see Marxism, Western; Marxist philosophy, Russian and Soviet; Marxism, Chinese). Other ideologies are of lesser political significance, either because they have drawn fewer adherents or because they have been influential over a shorter period of time: these include Anarchism, Communism, Fascism, Libertarianism, Republicanism, Social democracy and Totalitarianism.

2 Contemporary political philosophy

The last quarter of the twentieth century has seen a powerful revival of political philosophy, which in Western societies at least has mostly been conducted within a broadly liberal framework. Other ideologies have been outflanked: Marxism has gone into a rapid decline, and conservatism and socialism have survived only by taking on board large portions of liberalism. Some have claimed that the main rival to liberalism is now

communitarianism (see Community and communitarianism); however on closer inspection the so-called liberal-communitarian debate can be seen to be less a debate about liberalism itself than about the precise status and form that a liberal political philosophy should take - whether, for example, it should claim universal validity, or should present itself simply as an interpretation of the political culture of the Western liberal democracies. The vitality of political philosophy is not to be explained by the emergence of a new ideological revival to liberalism, but by the fact that a new set of political issues has arisen whose resolution will stretch the intellectual resources of liberalism to the limit.

What are these issues? The first is the issue of social justice, which in one form or another has dominated political philosophy for much of the century. Most of the many liberal theories of justice on offer have had a broadly egalitarian flavour, demanding at least the partial offsetting of the economic and social inequalities thrown up by an unfettered market economy (see Market, ethics of the; Justice; Rawls, J.; Dworkin, R.; though for dissenting views see Hayek, F.A. von; Nozick, R.). These theories rested on the assumption that social and economic policy could be pursued largely within the borders of a self-contained political community, sheltered from the world market. This assumption has become increasingly questionable, and it presents liberals with the following dilemma: if the pursuit of social justice is integral to liberalism, how can this be now be reconciled with individual freedoms to move, communicate, work, and trade across state boundaries?

The second issue is posed by feminism, and especially the feminist challenge to the conventional liberal distinction between public and private spheres (see Feminist political philosophy). In many respects feminism and liberalism are natural allies, but when feminists argue for fundamental changes in the way men and women conduct their personal relationships, or advocate affirmative action policies for employment that seems to contravene firmly-entrenched liberal principles of desert and merit, they pose major challenges to liberal political philosophy (see Desert and merit).

Third, there is a set of issues arising from what we might call the new politics of cultural identity. Many groups in contemporary societies now demand that political institutions should be altered to reflect and express their distinctive cultures; these include, on the one hand, nationalist groups asserting that political boundaries should be redrawn to give them a greater measure of self-determination, and on the other cultural minorities whose complaint is that public institutions fail to show equal respect for those attributes that distinguish them from the majority (for instance their language or religion) (see Nation and nationalism; Multiculturalism; Postcolonialism). These demands once again collide with long-established liberal beliefs that the state should be culturally neutral, that citizens should receive equal treatment under the law, and that rights belong to individuals, not groups (see Citizenship; Affirmative action; Discrimination). It remains to be seen whether liberalism is sufficiently flexible to incorporate such demands.

Finally, liberalism is challenged by the environmental movement, whose adherents claim that liberal political principles cannot successfully address urgent environmental concerns, and more fundamentally that the liberal image of the self-sufficient, self-directing individual is at odds with the ecological picture of humanity's subordinate place in the system of nature as a whole (see Green political philosophy; Environmental ethics). Liberalism, it is said, is too firmly wedded to the market economy and to consumption as the means of achieving personal well-being, to be able to embrace the radical policies needed to avoid environmental disaster.

None of these problems is capable of easy solution, and we can say with some confidence that political philosophy will continue to flourish even in a world in which the sharp ideological divisions of the mid-twentieth century no longer exist. We may also expect a renewal of non-Western traditions of political philosophy as free intellectual enquiry revives in those countries where for half a century or more it has been suppressed by the state. Political questions that have concerned philosophers for two millennia or more will be tackled using new languages and new techniques, while the ever-accelerating pace of technological and social change will generate new problems whose solution we can barely begin to anticipate.

Political philosophy in classical Islam

Political philosophy in Islam is the application of Greek political theorizing upon an understanding of Muhammad's revelation as legislative in intent. In lieu of Aristotle's Politics, unknown in medieval Islam, Plato's political philosophy assumed the primary role in an explanation of the nature and purpose of the Islamic state. Al-Farabi conceived of the prophet as a latter day philosopher-king, Ibn Bajja and Ibn Tufayl took their cue from Socrates' fate and cautioned the philosopher against the possibility of successfully engaging in a philosophical mission to the vulgar masses, and Ibn Rushd presented philosophy as a duty enjoined by the law upon those able to philosophize.

1 Background

Two principal facts have formed political philosophy in Islam: first, the revelation of Muhammad, and second, the absence of Aristotle's *Politics*, whether by intention or historical circumstance, from the canon of texts translated from Greek and Syriac in ninth-century Baghdad (see Greek philosophy: impact on Islamic philosophy §2). Muhammad's revelation is of course foundational for Islam itself. From the vantage point of political theorizing, however, the revelation accounts for the perceived divinity of the state (the caliphate) which Muhammad is taken to have founded. It further accounts for the state's legal basis, with the state established on and grounded in obedience to a set of divine injunctions and sanctions. Muhammad's revelation, then, was perceived by political philosophers in Islam as providing an opportunity to understand and clarify the nature of the perfect state here and now, not in some distant future when human nature might be transformed. For Islamic political philosophers, the divine law (*shari'a*) revealed to Muhammad was a necessary and sufficient condition for bringing about human felicity.

The second fact noted above, the absence of Aristotle's *Politics* from the Arabic philosophical corpus, is of capital importance in understanding Islamic political philosophy. As late as the sixth century AH (twelfth century AD), this work was apparently unavailable (see Rosenthal's introduction to *Averroes' Commentary on Plato's Republic* (1969: 22)). The absence of the *Politics* meant that Plato and Platonic political philosophy, as found in the *Republic* and the *Laws*, became paradigmatic (see Platonism in Islamic philosophy). The implications of this are enormous, for Aristotle's critique of Platonic political philosophy from the standpoint of his own non-idealist philosophical anthropology was not to become part of the tradition of political philosophy in Islam. Instead, what we find in the Islamic political philosophers are variations on standard Platonic themes, pre-eminently the notion of the prophet as an analogue to the Platonic philosopher-king, the ambiguous role of philosophy in the practical political sphere, and the deep division between an elite and the vulgar masses (see Plato §14). These themes are especially prominent in the founder of political philosophy in Islam, al-Farabi, and it is to him that one must first turn.

2 al-Farabi

For al-Farabi (§4), 'the idea of the philosopher, supreme ruler, prince, legislator, and Imam is but a single idea. No matter which one of these words you take, if you proceed to look at what each of them signifies among the majority of those who speak our language, you will find that they all finally agree by signifying one and the same idea' (*Tahsil al-sa'ada*: 43-4). These remarks, not anomalous in the Farabian corpus, indicate the convergence, indeed identity, of theoretical and practical concerns. These dual concerns, reminiscent of the Platonic notion of the philosopher-king, are together present in the Farabian notion of the prophet. For al-Farabi, the Prophet (Muhammad) is to be understood as a divinely inspired legislator, offering a perfect way of life and a community in which to flourish.

The successors to the Prophet - caliphs and imams - preserve this original beneficence by so ruling that each group of believers is offered a measure of truth commensurate with its particular capacity to comprehend it. This latter stratification of the social and political framework is again reminiscent of Plato and his division of the perfect state into intellectually disparate groups. For al-Farabi, the relevant division is between those who are able to ground their belief philosophically and those who are not, these latter being the 'simple' believers. Religion is an imitation of philosophy in this scheme, the former presenting the truth in a non-theoretical, non-abstract way, in pictorial terms replete with parables and stories. Viewed thus, al-Farabi's political teaching may well be seen as interpreting

the historical state founded by Muhammad along the lines of Platonic utopian theorizing. However, such Platonically-inspired intellectual elitism is offered not as a blueprint for political reform in a distant future, but rather as a fair description of Muhammad’s constitution and the state he founded. In its own way, Farabian political philosophy is a defence of Islam.

3 Ibn Bajja and Ibn Tufayl

In turning to Ibn Bajja and Ibn Tufayl, one turns not only from East to West, from Baghdad to Andalusia, but one also notes a marked change of emphasis away from that aspect of al-Farabi’s political Platonism which identified the prophet with a philosopher-king who rules a state founded on and governed by a divine law. For Ibn Bajja and Ibn Tufayl, philosophy (theoretical insight) and practical politics do not mix. They are quite incommensurable. As Leaman puts it: ‘ibn Bajja’s problem is how the philosopher in the imperfect state should relate to society’ (Leaman 1980: 110). The emphasis here must be upon the notion of ‘the imperfect state’. Courtiers both, Ibn Bajja and Ibn Tufayl must have taken a hard look at the political scene around them and drawn the relevant (pessimistic) conclusions.

In his *Tadbir al-mutawahhid (The Governance of the Solitary)*, Ibn Bajja addresses himself to the *nawabit* (weeds) in imperfect societies. These *nawabit* are the nonconformists in the societies they inhabit. They do not share the common goals and aspirations. Simply put, they are the philosophers in an imperfect world, and for Ibn Bajja the focus is how best to secure their happiness and safety. Ibn Bajja’s ‘realism’ leads him to fasten upon that strand of the Platonic political philosophical tradition which is the underside of al-Farabi’s political Platonism, the non-utopian strand. The problem for the philosopher in the midst of an imperfect society is to achieve happiness while avoiding dirty hands, not befouling himself (and philosophy) with the hopes and desires of the masses. The *nawabit* dwell amongst people, but do not find perfection in their midst. Thus they must live in isolation, dissociating themselves from ‘those whose end is corporeal [and] those whose end is the spirituality that is adulterated with corporeality’ (*Tadbir al-mutawahhid*: 78). The background here is no less Platonic for its being non-utopian and apolitical. For Plato, Athens and her citizenry stand guilty by their execution of Socrates, the philosopher. The lesson to be drawn is clear for Ibn Bajja as he forcefully denies any easy commensurability between philosophy and politics, between theory and practice in imperfect societies. For Ibn Bajja, the *nawabit* exist in spite of the society they inhabit (as in *Republic* VI 496d-e), and thus owe it nothing.

Ibn Tufayl’s allegorical tale, *Hayy ibn Yaqzan (The Living Son of the Vigilant)*, is not at odds with the ‘realism’ of his predecessor Ibn Bajja. Indeed, the story may well be read as a vivid elaboration of the latter’s thought about the incommensurability of philosophy and politics in an imperfect world and the resulting isolation which the philosopher must seek if he is ever to achieve felicity. The whole thrust of Ibn Tufayl’s allegory is the lesson that Hayy, the protagonist, finally learns painfully, that the philosopher will be unable to communicate successfully the deepest truths (the illuminative mysteries) as discovered by himself to mankind at large. Hayy’s strenuous efforts to instruct, born of compassion for and inexperience of humanity, are shown to be useless as even the best among men ‘recoiled in horror from his ideas and closed their minds…. [And] the more he taught, the more repugnance they felt’ (*Hayy ibn Yaqzan*: 150). Worse, Hayy comes to realize that not only are his pedagogical efforts nugatory, but they are also counterproductive, for they tend to undercut the very beliefs which the simple (non-philosophical) believers hold. The tale ends with Hayy, dispirited, returning to the isolated island whence he came.

Plato’s pessimism about the possible transformation of the empirical realm is manifest in the works and teachings of Ibn Bajja and Ibn Tufayl. The philosopher-king, the prophet, has no greater a foothold among his contemporaries than did Abraham amongst the idolaters or Socrates amongst the Athenians. The mass of mankind cannot become philosophers, and to attempt such a transformation is both dangerous for the philosopher and bad public policy. Both Ibn Bajja and Ibn Tufayl may be understood as cautioning would-be prophets (philosophers) of the perils inherent in their mission. Correlatively, they can be read as urging a rather conservative (traditional) status quo political agenda, in which stability and order prevail and are grounded in a punctilious observance of the law (*Hayy ibn Yaqzan*: 153-4). If society cannot be remade from the ground up, then perhaps no innovation whatever should be tolerated, lest anarchy and antinomianism prevail.

4 Ibn Rushd

Ibn Rushd (Averroes) wrote commentaries on both Plato's *Republic* and Aristotle's *Nicomachean Ethics*. For Ibn Rushd, the *Nicomachean Ethics* provides the theoretical substructure for the practical sciences, while the *Republic* (in lieu of Aristotle's *Politics*) provides the practical, political foundations for the attainment of human felicity, the goal of the practical sciences. So conceived, Plato's *Republic* provides a kind of blueprint for the best political order. In this framework, Ibn Rushd resuscitates the Farabian emphasis on the active role the philosopher should play in the political arena. Though he is aware of the precarious position of the philosopher, this activist focus should be understood in contrast to that of his Andalusian predecessors, Ibn Bajja and Ibn Tufayl, and their focus upon the necessity for the philosopher to maintain an apolitical stand.

Ibn Rushd thus shares with al-Farabi the view that philosophy has political implications. He underscores this dramatically by grounding the very study of philosophy in the law. The first question of his famous *Fasl al-maqal (Decisive Treatise on the Connection between Religion and Philosophy)* is: 'What is the attitude of the law to philosophy?' Ibn Rushd's answer is that the law commands the study of philosophy for those capable of it. There is thus a duty to philosophize. It should be noted, however, that the study of philosophy is no idle enterprise for Ibn Rushd, for given the legal injunction upon those capable of studying philosophy, a practical political obligation follows. The law revealed by the Prophet is a divine law, given to insure the well being of the entire community. If then the law enjoins philosophy, the philosopher is obliged to 'use' his wisdom for the benefit of all, in just the same way that the Farabian prophet (or Platonic philosopher-king) uses his wisdom, in a manner commensurate with the audience in question. Inasmuch as only the philosopher has an insight into the truth in a 'straight', undiluted way, without mediation of the senses, only he can interpret the law in an appropriate manner. Only the philosopher can allegorize when necessary, for only he knows the grounds upon which the allegory resides.

In his own way, Ibn Rushd provides an important defence of philosophy in a society governed by lawyers and judges like himself. Lest politics and political philosophy be handed over to those who (merely) apply the law, Ibn Rushd argues forcefully for a practical political philosophy which probes the foundations and guiding principles of the law. This, then, is arguably the greatest achievement of political philosophy in Islam, to conceive of a society grounded in obedience to a divine law as itself the manifestation of a coherent and theoretically defensible structure.

Political philosophy, history of

The history of political philosophy attempts to yield a connected account of past speculation on the character of human association at its most inclusive level. 'History' or 'philosophy' may be stressed depending on whether the organizing principle is the temporal sequence or conceptual framework of political thought. Anglophone work has increasingly been organized around distinctive political 'languages' defined by specific vocabularies, syntaxes and problems, for example, classical republicanism, Roman law, natural law, utilitarianism. Chronologically it has been usual to observe divisions between ancient, medieval, Renaissance, early modern and modern periods of study.

Ancient Greece is the source of the earliest political reflection, with a continuous history in the West. Here reflection on the nature and proper organization of political community stimulated inquiry into the difference between nature and convention, the public and the domestic realm, the distinctive character of political rule, the relationship between political life and philosophy, the identity of justice, and the taxonomy of state-forms - as well as a more sociological investigation of the stability and decline of political regimes.

Greek political vocabulary was adapted to existing Roman republican practice (by Polybius and Cicero for example), which soon gave way to an imperial constitution stressing peace, order and unity. Rome thus generated two contrasting political ideals - that of the virtuous active republican citizen, and that of the unified empire governed by Roman law. Together with questions about the causes of its own rise and decline, Rome thus provided political values and historical material for subsequent philosophical and historical reflection.

Christianity undermined the pagan autonomy of politics in the name of a higher, transcendent ideal. However, it adapted much of Greek rationalism and the political vocabulary of classical culture in elaborating a creed and an institutional form. In turn it lent legitimacy to imperial and royal officeholders of Rome and barbarian successor-kingdoms.

Medieval political philosophy was characteristically preoccupied with the relationship between pope and king, church and regnum, *but philosophy as a discipline was subordinated to theology. This was challenged by the rediscovery of Aristotle's self-sufficiently secular political ideal, a challenge met for a while by Aquinas' synthesis. However, the autonomy of secular politics was continually reasserted by a sequence of writers - Bartolus of Sassoferrato, Marsilius of Padua, Bruni and Machiavelli - who revived and reformulated classical republicanism using both Roman law and new Renaissance techniques and insights.*

The Reformation, although initially politically quiescent, gave rise to new conflicts between secular and sacred rule. In particular, radical claims about the responsibility of all believers for their own salvation fed through in various ways into more individualistic political philosophies. In early modern Europe, using the strikingly new (and originally Catholic) vocabulary of natural right, Hugo Grotius aspired to provide a common secular basis for a shared political morality, on the basis of individual rights derived from a universal right of self-preservation. This was widely explored by seventeenth and eighteenth century thinkers, notably Hobbes and Locke, and culminated politically in the American and French Revolutions. In the aftermath of the French Revolution, language of natural rights was rejected both by conservative thinkers, such as Burke, and by a new, utilitarian radicalism largely forged by Bentham.

Attempts to grasp the political character of economic transformations and Empire in early modern Europe resulted in a growing engagement with the essentially historical character of politics, the dynamic of which republican discourse was particularly well suited to exploring. Avoiding the loss of liberty which the acquisition of Empire had seemed to entail in Rome involved rethinking possible patterns of politico-economic development, providing a new definition of liberty which stressed personal and economic over political freedom, and proposing that impersonal institutional devices could replace virtuous motives in guaranteeing political liberty and stability. Such possibilities were explored by Montesquieu and Constant in France, Hume and Smith in Britain and 'Publius' (Madison, Hamilton and Jay) in America. They were rejected outright by Rousseau, for whom only the active citizen could guarantee rights, civic or civil.

The French Revolution was not only an event in which political philosophy played an important if hotly contested

role; it also, like the rise and fall of Rome, provided a central topic for subsequent political reflection. The character of modernity, the nature of revolution, the relationship of political ideas to political action, the strength or weakness of rationalism as an informing principle, the viability and desirability of the Revolutionary ideals of liberty, equality and fraternity, all became topics of philosophical speculation by post-Revolutionary thinkers such as Constant, Cabet, de Tocqueville, Burke, de Maistre, Saint-Simon, Owen and Coleridge, as well as a later generation including Comte, Carlyle and Marx.

In contrast to his predecessors' use of Lockean psychology and the conditioning effects of experience and association to understand the processes of socio-economic change, Kant's postulation of the transcendent self initiated a new vocabulary of idealism. This culminated in Hegel's attempt to show how philosophical and historical (including political) change could be understood as the development and realization of a trans-historical consciousness or Geist, *seeking to overcome internal tensions through a process of projection and transcendence.*

The notion that human self-understanding and practices are to be understood historically immensely influenced subsequent political thinking, being central to the ideas of Marx, Nietzsche and Freud (as well as shaping many of J.S. Mill's modifications of classical utilitarianism). All three of the former owed insights to Hegel's claims about the crucial and emblematic character of the master-slave struggle. However, while for Hegel and Marx the slave's insights represent the transition to a higher form of consciousness - mediated in Marx's case by a class revolution - for Nietzsche (despairingly) and Freud (resignedly) repression was a constitutive and self-perpetuating feature of modern politics.

While nineteenth century political thought was preoccupied with the historical conditioning of political sensibilities, Freud's discovery of the unconscious was accompanied by the emergence of a mass, irrationalist politics, characteristic of the twentieth century, and more suited to sociological than philosophical analysis. Nevertheless rationalist political theory, deriving from utilitarianism, and frequently drawing on (and contributing to) economic thought, remains the dominant accent in contemporary political philosophy.

1 Nature of the subject

At its broadest the history of political philosophy encompasses all recoverable philosophical reflection on the nature of politics. However, if more than a merely chronological presentation, it must give some account of the relationships obtaining over time between political philosophies. Such an account may emphasize the philosophical or the historical character of those relationships. Two extreme positions may be identified. At one extreme the history of political philosophy is conceived of as a series of attempts to articulate essentially timeless and universal truths about the character of human political association; the relationship between past political philosophers is understood as a shared and highly abstract trans-historical conversation. The other extreme stresses the constitutive character of contingent historico-political circumstance on the formulation of political philosophy, and hence upon its history. For these scholars the relationship between past political philosophers will be much mediated by their contemporaries' and predecessors' less philosophical works - sermons, tracts, polemic and the more symbolic forms expressed in ceremonial and institutional frameworks.

During the last thirty years the history of political philosophy, certainly in the Anglophone world, has been revolutionized by the second - historical - approach. This has affected content as well as methodology and has parallelled more general doubts about the possibility of characterizing philosophy as an activity abstracted from other social activities. The revolution involved rejecting the notions that 'ideas' could be identified as appropriate units of diachronic historical investigation (Skinner 1988), and that philosophically abstract political writings could, in themselves, comprise a history (Pocock 1971). More constructively, the revolution claimed that works of political philosophy were best - indeed perhaps only - to be fully understood, either individually or as part of a history, by relating them to their immediate linguistic and controversial context. The history of political philosophy was now to be understood as an account of linguistic and controversial innovation undertaken within relatively stable and discrete political languages - those of republicanism, natural jurisprudence or utility, for example.

While the historians of political philosophy address essentially historical questions, political philosophers have increasingly also used readings of the history of political philosophy to frame philosophical arguments. These have

particularly focused on the identity and supposed political and philosophical legacy of the Enlightenment (see Foucault, M.; Habermas, J.; MacIntyre, A.; Historicism).

2 Ancient: Greek

The history of political philosophy normally begins with the Greeks. Although philosophical reflection on politics was conducted in many early cultures, for example in China and ancient Mesopotamia, and although in some cases the texts produced (such as the Jewish Old Testament) subsequently influenced Western political thought, a continuous tradition of treating political questions at a high level of philosophical abstraction began in Greece of the fifth century BC.

Presocratics and Sophists: physis *and* nomos. The progress of Greek science, in seeking to provide agentless explanations of natural phenomena, created a bifurcated language of impersonal, natural laws contrasted with the conventional laws or rules governing human society (see Physis and nomos). In the rapidly changing, commercial, and increasingly egalitarian, society of fifth-century Athens this linguistic polarity was soon deployed in philosophical disagreements over the proper character of human political institutions. At least some of the Sophists - a heterogeneous group of professional teachers - taught that human laws were mere conventions and that nature sanctioned only prudential limits on self-interest (see Sophists). For Ancient Greeks virtue was an instrumental quality or skill that brought success - and success was a sufficient sign of virtue. In a democratic city-state, this was the art of persuasion, political or forensic oratory. But could mere success, regardless of means or content, count as virtue?

Socrates and Plato. Against these naturalistic, and in some cases morally opportunistic, arguments emerged the figure of Socrates. Although himself seen as a Sophist by moral conservatives and charged at his trial with ‘making the weaker argument appear the stronger’, Socrates, while a rationalist critic of conventional moral pieties (see *Euthyphro* and book I of the *Republic*), aspired to a transcendent political morality, and a metaphysical identity of the self which could be harmed only by moral turpitude. His acceptance of the death sentence, while believing it to have been wrongfully imposed, and his refusal to accept an offer of escape from friends, demonstrated his strong sense of political obligation, stemming from a contractual account of the relationship between state and citizen (see Socrates).

This is the intellectual setting of the *Republic* in which Socrates’ pupil - Plato, using his master’s persona to develop his own ideas - invokes the transcendent world of the Forms to rebut Thrasymachus’ claim that justice is merely whatever serves the self-interest of ‘the strongest’ (see Thrasymachus). While the particular institutional recommendations of the *Republic*, - equality of women, abolition of the family, communism - have clearly been marginal issues in Western political philosophy until relatively recently, the work identified what would become major and recurrent themes: the bearing of epistemology on political reality, cognitive and moral pre-eminence as a claim to privileged rule, the relationship between social class structure and individual psychology, the political role of education and the political dimensions of the processes of social change. Plato’s appeal to a rational, if veiled, truth, and his conception of the bad or imperfect as the corruption or privation of the true or good, proved congenial to the construction of a Christian philosophy.

Aristotle. Aristotle’s championship of man’s political nature also locates him in the Greek debate about the rival claims of nature and convention (see Aristotle). For Aristotle, nature, while not transcendent, was not simply empirically given, but involved a *telos*, an end or purpose which all natural entities possessed. For freemen, this included the achievement of civic life in a *polis* (a Greek city-state). Cultures - such as that of the Persians - which did not support such communities were unnatural and their inhabitants inferior. Nature was not only everywhere goal-directed, but internally complex and composed of diverse relations of rule and subordination. The *polis* for Aristotle was a complex entity comprising various subordinate forms of association (notably the family and the village) and containing a corresponding diversity of forms of rule. That form of association and rule which he identified as distinctively political obtained peculiarly and uniquely amongst equals (unlike most moderns Aristotle identified equality as a condition, not a presupposition, of political status). Apart from philosophical speculation itself, living in the *polis* allowed the citizen the fullest exercise and highest development of their faculties.

The categories Aristotle identified in his *Politics* provided an enduring vocabulary for political analysis down at

least to the emergence of modern political science in the nineteenth century. He devoted sustained attention to the concept of citizenship and produced a sixfold classification of constitutions - monarchy, tyranny, aristocracy, oligarchy, democracy, ochlocracy - according to whether rule was by the one, the few rich or the many poor, and whether it was conducted in the interests of the rulers themselves or the whole people. He also explored the social conditions which might render these types stable and the characteristics of mixed regimes, preferring - as most practicable - a hybrid aristocracy-democracy, or ‘polity’. Although Aristotle’s political writings were lost to Europe until their recovery in the thirteenth century, his work - together with Greek and Roman practice - was the source of a major European political tradition, republicanism.

Plato and Aristotle, like most Greeks of the classical period, saw the polis as the essential environment for the life of the fulfilled individual, and saw no unavoidable conflict between its demands and the proper aspirations of the individual.

Hellenistic schools. The aspiration to unite the languages of nature and citizenship was severely stressed by the breakdown of the city-state and the emergence of Macedonian and subsequently Roman imperialism. In the absence of a political structure in which to locate them, political categories in Hellenistic culture either disappeared from the analysis of man’s nature - which stressed either the individual’s natural sensations (see Epicureanism) or the withdrawal from social obligation (see Cynics) - or else they were projected onto a larger canvas, the cosmos itself, in which a shared rationality was claimed to generate universal citizenship and universal subjection to ‘natural law’ (see Natural law; Stoicism).

3 Ancient: Roman

Although the Greek observer Polybius applied Aristotelian categories to Roman history and gave an influential account of the dynamics of constitutional change, Roman republican political practice long predated theoretical reflection about it.

It was only with the imminent collapse of the republic that a theoretical synthesis of indigenous practice with Greek political language, influenced by Stoicism, was provided by Cicero, in his *On the Republic* and *Laws*. The text of the former was lost in late antiquity, but a number of important passages survived in quotation, including the definition of justice (‘that which gives to every man his due’) and of a commonwealth (‘the people’s affair; and the people is not every group of men, associated in any manner, but is the coming together of a considerable number of men who are united by a common agreement about law and rights and by the desire to participate in mutual advantages’) (Cicero, *On the Republic*: 129). In the *Laws*, he gave clear expression to the idea of a universal natural law transcending the positive laws of particular states. Cicero’s *Duties* became a hugely influential handbook of practical political morality while his work on rhetoric included a suggestive account of the passage of humans from a condition of nature into one of political society (see Cicero).

The establishment of a post-republican order under Augustus heralded a literary glorification of republican history and austere personal morality (see the work of Livy and Virgil), accompanied in practice by a consolidation of the various republican powers into the office of the princeps. The slide into imperial absolutism evoked Plutarch’s use of biography as a form of political reflection (*Lives of the Emperors*) and Tacitus’ influential essay on the oratorical political implications of the loss of public debate (*Dialogue on Oratory*) as well as a eulogy of the simple, virtuous and free Germans living outside the Empire (*Germania*).

Roman republicanism and law. Rome bequeathed to the West two potent political vocabularies and evaluative associations: one - going back to Aristotle - based on the active life of austere republican virtue and participatory citizenship (at least for the economically independent); and another - quintessentially Roman - based on a unified and authoritarian imperial system, essentially juridical and administrative. The judgment of the former on the latter was negative in the extreme; empire destroyed *virtù*, even civic and political life itself. On the other hand, the peace and prosperity normally prevailing under the unified Empire passed on another set of ideals. Roman law provided a vital political and jurisprudential resource for succeeding societies and political thinkers as well as comprising a mine of historical evidence. The sources were the compilations of the sixth century Emperor Justinian (collectively known as the *Corpus Iuris Civilis*). While these compilations had little directly to say about politics, and were neither systematically integrated nor metaphysically grounded, they were a rich source of examples and maxims, applied politically down to the late eighteenth century (see Roman law).

The incorporation of Christianity into the tradition of political theory both joined Judaic tradition with that of the Graeco-Romans and created a new language with a new agenda, and an authoritative, if hardly unequivocal, text (the Bible). The early Christians, expecting Christ's return, expressed an active contempt for earthly matters. Later recognition that this return was not imminent forced Christian thinkers to address the question of the Church's relationship to secular authorities - a question that became more complicated when the Roman Empire became Christianized.

Although the language of apostolic Christianity was thus originally separated from politics, it was, from early on, suffused with Greek philosophical influences. With the conversion of Constantine (AD 312) and the granting of toleration, however, and even more with Theodosius' adoption of Christianity as the public religion of the Empire (AD 393), Christian religious thought, Greek philosophy and Roman political thought and institutions were drawn together. Despite attempts by, for example, Tertullian, to reject Greek canons of rationality ('I believe because it is absurd'), and by Donatus and others to create a purified Church membership in, but independent of, the secular realm, the ideal that emerged was of the Church as a secular catholic body, including sinners and saints, committed to articulating a single and philosophically coherent orthodox creed (Nicaea), and establishing a *modus vivendi* with Christian secular powers. More threatening to Christian autonomy was the widespread tendency, particularly identified with Eusebius and Prudentius, and shared by Augustine in his early writings, to endow the Roman adoption of Christianity, and therefore Roman political institutions themselves, with providential and even eschatolological significance - to blend the universal Church and the universal empire, as images of the heavenly society, and even to see it as an intimation of the second coming of Christ.

The sack of Rome by its Gothic mercenaries under Alaric (AD 410) seemed to impugn not only this implicit Christian philosophy of history, but the power of the Christian God and the historical status of Christianity itself. Augustine's *The City of God* was composed to repudiate such implications, to distinguish both the Christian Church from Roman politics, and the idealized Heavenly City of the elect from the secular Church on Earth. As the title suggests, Augustine self-consciously drew on Graeco-Roman political language, systematically subverting its secular meaning and projecting it on to a Christian, transcendent realm. This rhetorical strategy had already been used by Augustine's teacher Ambrose, who gave a Christian meaning to the Ciceronian dictum that the foundation of justice was good faith, and applied Cicero's image of the body politic to the body of Christ as his church. Yet while Ambrose tended to continue to identify Christian emperors with Christian purposes, Augustine's most celebrated move was to repeat Cicero's definition of justice - 'which gives to every man what is his due' - and to argue that since the secular realm distracts man from union with his God, the secular city, even when Christian, can never be truly just.

Augustine applied to politics a Christianized Platonism already explored by Plotinus in order to avoid the dualist heresy of Manicheism (of which he had at one time been a devotee). Christian Platonism could account for evil, not (heretically) as a countervailing cosmic force, but simply as a privation of good, brought about by humans' own wrongful ordering of priorities. Since the Fall humans were congenitally incapable of correct evaluation of things without the intervention of divine grace. Political institutions and the peace they could bring were of value, but only to deal with outward and secular conflict; they were incapable of reaching men's souls. Man was sociable by nature and political through sin.

In 494 AD an authoritative statement of the relationship between Church and polity was provided by Pope Gelasius I, who articulated the doctrine of the two swords, spiritual (*auctoritas sacrata pontificum*) and secular (*regalis potestas*). Emperors were to submit to the Church's teachings on religious issues, clerics were to obey the laws. The emperor was to wield the secular sword at the command of the Church. This went beyond the Pauline injunction to leave to Caesar that which was Caesar's, and assumed a deeper identity between 'Christian' and 'Roman' and a division of labour - spiritual and political - amongst Roman Christians in pursuit of a shared end.

4 Medieval

The supervention of the Germanic kingdoms on an already fragmented Roman Empire and the subsequent centuries of only sporadic order did not terminate Roman political discourse or the periodic aspiration to reinstitute the universal Christianized Roman Empire. It did result, however, in the temporary loss of important works which might have sustained it (Aristotle's *Politics*; Cicero's *On the Republic*; Justinian's *Corpus*), and it did largely end systematic political philosophy. For many centuries the known 'texts' of political philosophy have been largely the

practices, oaths, institutions and proclamations of political actors, and as we have come to recognize linguistic acts we have, conversely, also recognized the textual qualities of acts.

While kingship was a characteristically Germanic institution, marginalized - at least in philosophical treatises - by the republican traditions of Greece and (republican) Rome, it became enmeshed in the language and concepts of Roman law, Christianity and universal empire, almost as soon as it appeared. The persistence of a diversity of rulers within Christendom, and the existence of a Church claiming universal spiritual jurisdiction, provided the parameters within which this language had to be redefined. Despite the subsequent myths of elective councils and of constitutional and popular kingship, early Germanic kings, especially those who seemed capable of restoring a Holy Roman Empire, often continued to claim, or had bestowed upon them, Roman imperial authority. Sometimes the language of imperial kingship itself was ascribed to the Church: Isidore of Seville saw the existence of a universal church as the body of Christ the King as nevertheless quite compatible with the existence of a diversity of secular kingdoms. The rulers of such kingdoms were, however, all to be thought of as providentially appointed, and were obliged to pursue Christian ends; where they did not, they were seen as just instruments of God’s wrath.

Philosophy, in medieval education, was in the service of and subordinated to theology. It attempted to establish coherence by synthesizing the deliverances of eminent authorities on disputed questions. The most striking achievement of this kind lay in the work of Thomas Aquinas. He synthesized not only much of the elaborate and diverse Christian tradition but also sought to incorporate into it the potentially threatening naturalistic political philosophy of Aristotle, newly recovered from the world of Arabic scholarship and translated by William of Moerbeke. Aquinas’ agreement with Aristotle’s claim that man had a natural end or *telos* in political or social life - however qualified by the further end in God to which only the Church could minister - marked a different and much more congenial view of the relationship between politics and Christian belief, and between man’s natural and religious ends, than Augustine’s. For Aquinas, ‘grace does not abolish nature but perfects it’. Aquinas offered an influential account of a nesting hierarchy of laws governing the world - eternal, divine, natural and human - and of the kind of reason governing each and their method of promulgation. Such a hierarchy held the potential, present in all juristic thought, for a critical appraisal of positive law, yet Aquinas, while expressing a prudentially grounded preference for a limited monarchy, tended, like many medieval thinkers, to look to local positive law in defining legitimate political institutions.

Within the language - and the practice - of law, a major tension existed between the Roman law doctrine locating the law in the will of the prince and both natural-jurisprudential and Germanic customary doctrine which implied the duty of the prince to legislate according to pre-existing universal, natural or customary standards, a tension which influenced much of the language of sovereignty and constitutionalism (see Roman law; Common law). This was expressed in two contrasting medieval beliefs about the source of political authority, which (to simplify) might be seen as ascending from the people or as descending from God (Ullman 1966). The fourteenth-century Jurist Bartolus of Sassoferrato and his pupil Baldus elaborated a justification of the popular source of sovereignty in city-states. Natural reason, whether through custom or the active consent of citizens, was, according to them, adequate to create an autonomous and self-sufficient commonwealth. Each thinker applied the Roman law terminology of corporations to both city-states and kingdoms. Political entities could thus be conceived of as *personae fictae*, with a continuous identity, distinct from the natural persons comprising them or their ruler. An even more strikingly methodologically individualist - even anarchistic - position was advanced by the nominalist William of Ockham.

Another language, deriving not from Roman law but from Germanic custom - the language of community - provided a variant of the view that power ascended. Medieval communities of various kinds were customary collectivities without necessarily being legally *personae*. Thus there was another language through which the idea of a collective unity could be articulated. Here, and in certain feudal structures, we find the origins of the idea of political representation.

The Church was also a collective entity, on one description a *corpus mysticum* identified with the body of Christ. Yet just as the kingdom had a transcendent identity as well as a physical one, so the Church needed a legal and political identity as well as a religious one. Conciliarist thinkers, notably Nicholas of Cusa, developed a view of the Church as superior to the pope and capable of representation through its council. Some, such as Pierre d’Ailly and Jean Gerson, drew a parallel between the secular model of the mixed constitution - king, aristocracy and

demos or people - and the structure of the Church, comprising pope, cardinals and council. (See Black 1970.)

5 Renaissance

From the end of the eleventh century, the emergence and growth of self-governing cities in northern Italy, their internal political relations, and their antagonistic relationship with the Holy Roman Emperor (who claimed allegiance from many of them), created two important needs: first, for the production of impressive and persuasive diplomatic and other kinds of ceremonial, public and commercial documents; second, for a language capable of articulating resistance to imperial authority. The first was met by the development of a sophisticated class of scribes, the *dictamini*, who applied their knowledge of classical rhetoric and literature increasingly to the development of distinctive civic genres - model orations, city chronicles and political advice books. The second was more problematic. Both Catholicism and Roman law, drawing on Rome's imperial rather than republican legacy, emphasized the importance of political unity: the lowest regions of Dante's *Inferno* were reserved for those who had destroyed the sources of either religious or political unity - Judas Iscariot, Brutus and Cassius. It was one of the ideological triumphs of the civic republican Renaissance to convert Brutus into a hero.

Both Marsilius of Padua and Bartolus of Sassoferrato used scholastic and juristic resources to elaborate *de facto* legitimations of the autonomy of city-states from both imperial and papal authority. Bartolus spelled out the claim that free cities were 'princes to themselves', and that this meant that they were free both to assign jurisdictions and to establish forms of internal government without higher approval (Skinner 1978). Marsilius' strikingly modernistic (and heretical) view not only presented the 'whole body of the people', legislating through their representatives, as the source of law, but subordinated ecclesiastical authority to that law. In this notion of disparate, individually omnicompetent political entities lay the origin of the conception of a world of states which supervened on the aspirant universality of Christendom. Marsilius and Bartolus both derived their views from a republican argument, although the autonomy of states was also consistent with a Roman law defence of the absolute ruler, now thought of as *imperator in regno suo*.

However, there was a language available to, and increasingly being recovered by, both the *dictatores* and the humanist scholars of classical literature which praised, indeed glorified, the active political life in the free polity. Although initially the *dictatores* focused purely on classical rhetorical technique and style, and humanists were uninterested in or even repelled by the political life of the Ancients, by the fourteenth century both were employing ancient models to revive classical republicanism. This celebrated the liberty secured by active citizenship and explored *topoi* - founding, location, laws, institutions, political culture and social order - which affected the freedom and survival of the republic, thereby reviving interest in the secular causal processes at work in historico-political change.

The culmination of this development was the writing of Niccolò Machiavelli. Appropriating in particularly innovative ways the characteristic genres of the new civil science - the advice book (*The Prince*, *The Art of War*), the classical textual commentary (*Discourses on…Livy*), the civic history (*History of Florence*) - Machiavelli repudiated not only Christian homiletics but many Ciceronian values (see Machiavelli, N.).

The major polarity in Machiavelli's analysis was between *virtù* - the energy and capacity to act effectively in the political realm - and *fortuna* - the personification of those unpredictable secular forces which control human affairs. Political action comprised the imposition of order (form) on an inchoate political nature (matter). In so presenting politics, Machiavelli scandalously presented man performing a divine role. In *The Prince* Machiavelli pays particular attention to the extreme situation of a ruler seeking power where there is either no pre-existing order, or one inimical to his rule, thus highlighting the role of and qualities comprising *virtù* in the absence of assistance from custom, divine grace or nature. Such extreme but politically paradigmatic circumstances required, he claimed, absolute political autonomy and an opportunistic subordination of moral norms, whether Christian or classical, to the requirements of political survival.

In the *Discourses* Machiavelli turned his attention to the problems of republican regimes. His focus on Roman history provoked a deeper analysis of the secular processes, the interplay between historical circumstance, laws, military experience and social structure which shaped the characters of the citizens and the survival of the state. This analysis was to prove immensely influential for later republicanism, both as ideology and as an emergent secular historico-sociological analysis.

6 The Reformation

While Machiavelli considered religion only as a factor in political sociology, the Protestant Reformation reinvigorated both religious ideals and religious jurisdiction as a source of political argument. Underlying Luther's rejection of indulgences, outward forms and the jurisdictional authority claimed by the Church, lay a more fundamental theological question - that of man's free will in gaining salvation (see Luther, M.). This was made explicit in his exchange with the Christian humanist Erasmus. Luther argued that humankind were saved through faith (not works) bestowed by God (not individual human will, however trained or disciplined). This theology not only undermined - as intended - the sacramental and clerical efficacy of the Church, it changed its identity from a catholic and secular administrative structure into a *congregatio fidelis*, with purely admonitory power. At the same time Luther distinguished sharply between man's spiritual and worldly existence. For secular purposes man possessed free will, and political obedience was required, not only to curb sin and for the purposes of natural peace, but because even tyrants represent God's will in the world and may not be actively resisted. German peasants in revolt blasphemed by 'making Christian freedom a physical thing' (Oakley 1991: 173). It was the mistake of the Anabaptists' 'radical reformation' to erode Luther's distinction between the spirit and the world, which led them to believe they could, by acts of political will, provoke moral and religious reformations.

Perhaps the most difficult problem for Reformation thinkers to articulate remained the question of resistance where the magistrate opposed the reformation required by God. Luther himself after 1530 acknowledged that where the constituted authority itself allowed an active right of resistance (for example, in canon and civil law), it was not sinful to resist if magistrates - even the emperor - acted outside the law. Two distinct arguments emerged. One was constitutional, and sought to legitimate resistance by identifying officeholders other than the emperor (or, later, the French or Spanish king) as 'powers that be [which] are ordained of God' who might exercise a right - indeed a duty - of resistance consistent with St Paul's authoritative injunction to obey established power (Hotman, Beza, Mornay). This could be done either by federalizing relations within the Empire, or dignifying what Calvinists called 'inferior magistrates' - variously identified with provincial or civic officials and buttressed by classical allusions to Spartan ephors and Roman tribunes. The other more radical argument licensed the resistance even of private individuals. According to it the failure of rulers to operate within the laws defining their office effectively reduced them to the status of private individuals against whose actions other individuals and collectivities possessed - under canon, civil, and even natural law - a right of active defence.

Reformation discourse was also radicalized by the language of covenant theology. Calvin presented holy history as a series of covenants between God and his people. Reformation churches were formed through covenants among their members, who had a duty to God to maintain the terms on which the community was instituted. The theory thus provided a radical individualist and contractual basis for political authority, obedience and resistance, which was, however, utterly theological in origin. The initial separation between world and spirit was thus overcome in the political language of the Reformation, which had on the one hand incorporated a secular theory of resistance to government and, on the other, formulated an individualistic account of the source of political authority in voluntary agreement.

Calvinist constitutional resistance theory was further elaborated in France by the minority Huguenots, anxious to appeal to a wider constituency against the emergence of an absolutism increasingly inclined to impose Catholic orthodoxy (Salmon 1987; Kelly 1970) and above all in the Spanish Netherlands, where the successful Dutch Revolt occasioned a massive pamphlet literature elaborating a language of civic independence, the true significance of which is only just coming to be acknowledged (Van Gelderen 1993).

7 Scepticism and toleration

From these contexts, too, emerged a range of arguments in favour of religious toleration (see Toleration). Some of these appealed to the essential similarity of all religions and the unimportance of dogma. Others deployed sceptical arguments, claiming that it was wrong to coerce other people over matters in which rational certainty was unattainable. Meanwhile, Michael de L'Hopital and Jean Bodin forwarded *politique* arguments which held that, whether truth in religious questions was attainable or not, toleration should be practised as a condition of civil peace.

One major consequence of internal religious war, in France, the Low Countries and - as is increasingly being

recognized - Germany, as well as later in England, was a revival of ancient Stoicism (see Lipsius, J.; Montaigne, M.E. de; Stoicism). This fuelled both an inner perseverance and constancy in the face of adversity and political acceptance of *de facto* powers. A growing moral agnosticism led politically to a renewed, sceptically-based insistence on the need to accept the established faith and political order. In this context there appeared too a controversial new political term: 'reason of state' - the 'knowledge by which…stable rule over people may be founded, preserved and extended…when such actions cannot be considered in the light of normal rules' (Botero in Burke 1991: 480).

Both the term 'state' and a vocabulary in which its imperatives could be presented as autonomous and irresistible were now available. They were first assembled by Jean Bodin, who used legal terminology to define sovereignty rather than inquiring into the constitutional practice of particular regimes or assembling it from distinct powers as, even in imperial Roman law, it always had been. Eschewing Roman law as a historically parochial phenomenon, Bodin sought to understand sovereignty analytically as a necessary feature of the state - 'an absolute and perpetual power over citizens and subjects' (see Sovereignty). All office in the state is held at the sovereign's pleasure. Moreover, the sovereign not only enforces the law, but makes it (without consultation if it pleases), and stands above it, bound only by the objective conditions that determine its own survival - a rule of succession, conformity to natural law and the law of God.

From this basis Bodin proceeded to analyse the natural and historical circumstances affecting the successful establishment of states. In thus admitting natural and historical considerations only as factors affecting success or failure in instituting an abstractly defined conception of state, Bodin cut through both the competing languages of legal constitutionalism and naturalism, while not quite closing the door to interpretations of God's purposes.

Annexing a Bodinian conception of sovereignty to a strict interpretation of the divine ordination of political power expressed in God's grant to Adam yielded the socially reverberant language of patriarchalism associated with Sir Robert Filmer, Locke's famous protagonist. The historico-philosophical (as opposed to sociological) interest of Filmer lay perhaps less in his patriarchalism than in the objections he was able to pose to the radical contract theory emerging amongst the Levellers and other participants in the English Civil War - objections that Locke later sought with some ingenuity to overcome. Filmer's counterargument drew upon theories of long standing - amongst Catholics, as he gleefully pointed out in *Patriarcha* - which grounded political power in a voluntary contract of individuals and derived from this principles both of resistance and of private property.

8 Early modern natural rights theory

Several Catholic publicists of the Reformation period had argued for constitutional limitations on political power, which was conceived to emanate from, and in some ultimate sense remain in, the community. John Major followed Gerson in articulating an unlimited subjective conception of 'right' as free disposal, drawing the corollary that kings can have no such right over their people. However, it was the Spanish neo-Thomists who began to elaborate the most distinctive and far-reaching natural rights language to combat a range of opponents, including Lutherans, Machiavellians, conciliarists and Catholic apologists of Iberian imperialism in America.

The revival of Thomism was an attempt to counter the heretical (Lutheran) view that humans were incapable of knowing God's law, and that dominion was founded only on (inscrutable - and therefore unquestionable) grace. Dominicans and Jesuits reasserted Aquinas' hierarchy of law, with Natural law as both a specification of divine and eternal law and a practicable criterion of the legitimacy of human, positive laws. Stretching Aquinas, they also claimed natural law was imprinted in, and even a habit of, the mind, available to all humans independent of revelation (see Molina, L. de; Soto, D. de; Suárez, F.). This enabled them to establish the legitimacy of secular institutions (and indeed that of the Church, as a historical entity with a tradition of doctrinal interpretation) by deriving them directly under natural law. This same argument also refuted the claims of Machiavelli, curiously allied to those of Luther, concerning the irresistibility of reason of state.

Although human community was natural, and although natural law was available to men in what became known as the 'natural condition', in which men were free and independent, political society was a voluntary human creation. Although the concept of the 'social contract' was not yet theoretically elaborated, and although Suárez emphasized the pre-existence of community to avoid already notorious difficulties involved in constituting it from individuals through contract, the notion of consent or agreement to the establishment of political rule - as one condition of its

legitimacy - is clearly present (see Vitoria, F. de).

One important application of neo-Thomism had been the claim made on behalf of King Ferdinand of Spain that American Indians - being evidently incapable of political society - must lack natural reason and so be natural slaves who might justifiably be captured and deprived of their possessions. This position was attacked from the 1530s onwards by members of the school of Salamanca using similar neo-Thomist language. Vitoria and Las Casas in particular cited the, by then, undoubted empirical evidence of Aztec and Inca capacity for civilized life, demonstrating that Indians had indeed used their natural reason to construct political institutions. They could not therefore be slaves, and their property and authority was legitimated under natural law.

This vocabulary of a state of nature, natural law and the establishment of political authority by a contract alienating natural rights was transformed from an identifiably Catholic position into the foremost language of the modernizing and Protestant communities of Europe within the space of a generation, largely by the Dutchman Hugo Grotius. Writing initially in the context of international legal controversy, where neither sceptical acceptance of positive authority nor appeal to shared values was productive, Grotius performed a series of moves which subsequent generations regarded as constitutive of modern natural law theory. First, following the Jesuits, he located the source of natural law in the will of the agent. Second, following ancient and revived stoicism, he made self-preservation the primary natural right: self-defence and a right of acquisition followed as consequences of this. Third, he emphasized the potentially naturalistic grounds of such a theory, which would hold even if (scandalously contrary to his own professed belief) there were no God. Perhaps even more importantly, he adopted a systematic and deductive mode of argument which self-consciously modelled itself on mathematics.

Immediately picked up by Selden and Hobbes in England, by Samuel Pufendorf in Germany and at the Swedish court, and by John Locke, working in England and The Netherlands (and aided by the popularizing work of the Frenchman Jean Barbeyrac), within two generations this enterprise had gained a huge pre-eminence in political-philosophical discourse. Taken literally, the idea of a comprehensive, aboriginal, subjective natural right assumed that legitimate political authority must have emerged through some consensual transfer of right from the individual. This might lead either to a historical search for plausible relics of such a contract in customary law (see Selden, J.) or to its identification with specific events - such as Magna Carta or practices such as the coronation oath. Alternatively, philosophers might try to reconstruct the terms of such a grant of authority a priori, on the grounds of what would have been reasonable or - in the case of most thinkers including Locke who retained a natural law constraint - legitimate to agree to. Some thinkers made the grant of right virtually unconditional, binding and irrevocable, establishing as it did the power to punish, which they tied logically or effectively to obligation; others saw it as highly conditional and revocable. Some, like Hobbes, considered there to be two contracts - a contract of union constituting society and a contract of subjection or government between the resulting society and its rulers (Hobbes, T. §7). Others denied the latter (see Rousseau, J.-J.) or the former (as had Vitoria and the Jesuits), or conflated the two (Hobbes). At its most radical, the criterion of natural right became a continuing condition of governmental legitimacy, and the failure to respect it presumptive grounds for resistance (as, for example, wuth the Levellers, Locke and Paine).

Hobbes' masterpiece, *Leviathan*, inserted a Bodinian idea of sovereignty into a synthesis of the language of natural right and contract, materialistic psychology and naturalistic epistemology. His sustained deductive argument, supposedly modelled on geometry, established a model for political philosophy which has lasted, and increased in fascination, until the present day.

A major issue for the new natural rights language, which played a central role in the increasingly commercial and imperial states of Europe, was that of the origin and moral limits of private property rights. A divine sanction for property rights was a logical casualty of the new secular basis of modern natural rights theory, and it was implausible to attach them directly to the natural condition. Arguing against the Royalist Robert Filmer, who identified all authority - political and economic - with the patriarchal monarch or male household head, John Locke distinguished the different occasions and mechanisms by which political and property rights emerged - a collective act of trust and individual labour, respectively. In so doing he gave a philosophical justification of some main aspects of the modern state, combining as it did centralized political authority with dispersed economic rights.

9 The political language of a modern commercial society

Hobbes, despite the fascination of his ideas, was widely repudiated for the atheism confidently supposed to underlie his egoism, naturalism and materialism. The powerful new view of natural right as unconstrained and subjective was seen to license a threateningly egoistic psychology - despite attempts to mollify it by ascriptions of natural sociability to humans (as in Pufendorf). Such worries were reinforced by the increasingly commercial character of society, analysis of which was a major preoccupation for eighteenth century thinkers. Bernard Mandeville's claim that the 'private vices' of individuals aggregatively produced 'public benefits' still seemed to offer - as he may have intended - only the alternatives of austerity or hypocrisy (see Mandeville, B.). His opponents sought to diffuse this opposition either by asserting an innate moral disposition or moral sense (see Moral sense theories; Hutcheson, F.), or by constructing some convincing account of how moral dispositions emerged from more primitive psychological traits, such as sympathy (see Hume, D.) or sociability (see Smith, A.).

The growing preoccupation with the social processes by which the moral sentiments - or more generally the 'opinion' on which politics was increasingly seen to rest - were constructed, transmitted and sustained revealed a tension in political philosophy between moral philosophy or natural jurisprudence and historical sociology. A republican tradition deriving ultimately from Machiavelli's speculations on the decline of Rome, but reinterpreted by Harrington and his English followers, and by Montesquieu in France, provided a helpful vocabulary in which to treat patterns of secular historical change. Yet while this republican language was a rich resource in theorizing long-term and impersonal socio-economic processes, it was preoccupied with decline and initially suspicious of wealth, commerce and refinement as destructive of the public virtue required in the commonwealth.

The emergence of a political theory built around a programme of 'politeness' in seventeenth century France and in Britain at the start of the eighteenth century by Shaftesbury, by Addison and Steele in their journal *The Spectator* and by Francis Hutcheson was one of a series of attempts to accommodate the polity's presumed need for political virtue with the development of a wider commercial society. The ultimate achievement of Adam Smith and David Hume was to explain how the progress of commerce, by encouraging rational patterns of thought, wider social interaction and refined appetites, led to the decline of irrational 'enthusiasms' -party political or religious - and encouraged the emergence of a polite society supportive of liberal, moderate politics (see Enthusiasm). Like Montesquieu they came to reject the simple contrast between the liberty of republics and the servility of monarchies, and described modern, commercial monarchies as supportive of a new kind of private liberty resting on structural features rather than on individual qualities. Both thinkers, however, recognized the precariousness of this balance, Smith pointing to the debilitating effects produced by the division of labour, and Hume to the danger of regimes bankrupting their economies through succumbing to the temptation offered by the new institutions of public credit. In general this analysis drew attention to the vital role of opinion in sustaining, or undermining, political rule, a preoccupation wholly in keeping with the undoubted fact of increasing popular political mobilization. Hume's programme for a more complaisant politics involved the deployment of sceptical and consequentialist arguments to displace opinions derived from metaphysical notions of right in favour of sober understandings of interest.

Belief in right was, nevertheless, the motivating force behind two modern Revolutions in America and France. While Locke, Blackstone and English common law maxims ('no taxation without representation') were invoked to justify resistance to English tyranny, American publicists increasingly drew on Montesquieu and Hume in seeking to establish a constitutional settlement in their new, extensive and federal republic. *The Federalist Papers* composed by 'Publius' (Jay, Madison and Hamilton) sought to adapt republican vocabulary to persuade a wide political public that the proposed constitution provided for a central government powerful enough to replace the defective Articles of Confederation, while leaving enough power to the states to assuage the worries of those who believed that republican liberty could not survive in large polities. Through its popular, yet state-by-state, ratification the American constitution comprised an uneasy tension between popular and constitutional sovereignty. The restraint of power, something of an eighteenth-century Anglophone preoccupation, was achieved in America through its division - between centre and periphery, between different government institutions (legislature, executive, judiciary) and through the staggering of elections over time.

In France, the preoccupation with 'opinion' took a much more didactic form through the activities of the *philosophes* particularly in the assembling and publication - principally by Denis Diderot and Jean d'Alembert - of *L'Encyclopédie*, a self-conscious attempt to reform the terminology and preoccupations of scientific, cultural and political language. Much influenced by a reading of Lockean psychology and politics, but with strong materialist

and agnostic strands, the *philosophe* movement conducted an elitist rather than a democratic intellectual guerrilla war in (and later from outside) the territory of French absolutist sovereignty. However, it was the anti-*philosophe* Jean-Jacques Rousseau who produced the most arresting political philosophy, synthesizing French absolutism and his native Genevan republicanism.

Rousseau fundamentally challenged the growing accommodation of inherited political languages to commercial modernity so evident in the writings of Hume, Montesquieu and Smith, and later 'Publius' and the *philosophes*. His *Discourses*, especially that on the *Origins of Inequality*, while recognizing the essentially sociohistorical sources of morality, asserted an intimate connection between the development of commercial civilization and that of dependency, inequality and loss of self. For him there was hardly space - conceptual or historical - for an account of a society advanced enough to be civil and moral without yet being divided and corrupt. In *Du contrat social (The Social Contract)*, however, he sought to present this possibility in the language of contract theory. Central to his argument was the absolute, yet inalienable, quality of sovereignty established by the contract constituting society and retained by the citizens in their collective identity as a sovereign body independent of government. Rousseau claimed thereby to have solved the paradox of political freedom, for despite subjection to a common sovereign, each as legislator 'remains as free as before'.

Rousseau's attempts to ensure constitutionality - through observation of due formal processes, the subjection of all to universally phrased laws and his insistence both that the sovereign body could never be represented, and that it might sometimes fail to express the legitimizing, but noumenous, 'general will' - were widely ignored by his followers during the Revolution, reaching their most ironic expression in Robespierre's claim to embody the latter in his person.

The French Revolution - like the rise and fall of Rome before it - defined a matrix of problems and linguistic perspectives for political thinkers of the succeeding centuries. These included the conception of sovereignty as popular will and the consequent dangers of popular mobilization, the identity and significance of the Revolution within world historical processes and the relationship between philosophical doctrine and politico-historical outcomes.

10 Response to the French Revolution

The dominant language of the Revolution was that of modern, secular, natural rights, which interpreted such rights as inherent properties of individuals, and which attempted to deduce the legitimacy of particular institutional arrangements from these abstract ethical principles. While this model of political philosophizing remains very much alive today (see Rawls, J.) its implication in the violence of the Revolution led to strong philosophical reactions.

Both features of natural rights were attacked by Edmund Burke, whose response has had an enduring appeal in the Anglophone and German-speaking worlds. *Reflections on the Revolution in France* stressed the inadequacy of human reason to comprehend the function and utility of many social institutions, beliefs and practices which have been built up over time through adaptation to local circumstance. Drawing on sceptical epistemology and common law jurisprudence, Burke privileged the collective knowledge embodied in customs and institutions over individual claims to knowledge, particularly those that derived from analytical or deductive reasoning. The Revolution was thus, at the level of ideas, an outbreak of irrational secular 'enthusiasm', parallel to religious movements of the past. Moreover its particular content - natural right - licensed the intrusion into politics of all human agents whether suitably educated or not. Important responses to Burke included those of Tom Paine, William Godwin and Mary Wollstonecraft, who, while rhetorically defending natural rights against Burke's attack, used a republican vocabulary of virtue both to open discussion of the political significance of the private arena and to establish a political role for women.

In France the aftermath of the Revolution produced attempts to divert the language of republican liberty from its ancient austere and civic-activist roots, to which Benjamin Constant famously sought to add an understanding of modern, commercial liberty. Alexis de Tocqueville, too, in *De la démocratie en Amérique (Democracy in America)*, provided a socio-historical analysis both of the *ancien régime* and of what he took to be the paradigm of emerging modern society. Meanwhile the rationalist, social-engineering aspect of the Enlightenment might be said to have lived on in the industrial utopianism of Fourier, Saint-Simon and his followers including Comte (see

Utopianism; Saint-Simon, C.-H. de R.; Comte, A.).

While the language of radical natural rights declined in the nineteenth century (later to be revived in the era of international charters and organizations) a new radical language - that of secular utilitarianism - was being consciously forged at this time by Jeremy Bentham and would be elaborated and promulgated by his many reforming disciples (see Bentham, J.; Utilitarianism). While general appeals to utility had been common in earlier epochs, particularly in Cicero and his followers, Bentham proposed something much more precise; namely, that the aggregate quanta of anticipated pleasure and pain should be the sole criterion of public policy. He also laid out exhaustively the dimensions by which the necessary calculations might be attempted. Resolutely dismissive of metaphysics - including inalienable natural rights (which he viewed as ‘nonsense on stilts’) - Bentham’s initial work was in jurisprudence, applying positivist criteria to Blackstone’s *Commentaries on the Laws of England*, but he gradually arrived at the view that only a democratic franchise could ensure the political will to implement the utilitarian legal code he sought. Influential in British and French nineteenth-century social reforms and in a variety of liberal nationalist movements from Greece to South America, Bentham’s version of utilitarianism nevertheless ran into philosophical difficulties, from which John Stuart Mill, the son of Bentham’s collaborator James Mill, sought to rescue it.

Mill’s reformulations involved acknowledging a qualitative dimension of pleasure, limiting utility’s potential for eroding moral rules - especially justice - by developing, in all but name, a distinction between rule- and act-utility, and placing the utilitarian assessment of political phenomena and institutions within an historical, developmental schema. In this way - and by a famous defence of the liberty needed to innovate - he sought to increase, as well as use, the ‘good qualities’ present in society, and to secure ‘utility in the largest sense, grounded on the permanent interests of a man as a progressive being’. This extension of utilitarian language nevertheless diminished its original programmatic policy appeal, as well as its original distance from the ideal-regarding criteria to which Mill’s successors, the ‘New Liberals’, increasingly turned.

11 Idealism and Marxism

Late nineteenth-century liberals in Britain (such as T.H. Green, Bernard Bosanquet and F.H. Bradley) and in Italy (Benedetto Croce) appealed to a revived idealist language which, following Kant, had developed through to mid-century in Germany, but, with a few significant exceptions (such as Coleridge) had not exported well (see Idealism). This language rejected the Lockean premise of an essentially passive mind, and instead emphasized, in varying degrees, the agency of the mind in organizing experience, and the essentially ideational character of reality. Powerfully articulated by Kant, the social and political implications of this were spelled out most fully by Hegel, who sought to synthesize history and philosophy - time being, he claimed, the dimension in which thought articulates itself through a series of projections which it does not initially recognize as its own product. In the social sphere of right (objective mind), Hegel sought to show that the essentially legal categories of right such as property, contract and punishment - no less than the institutions of the family, civil society and ultimately the state itself - are not obstacles to individual freedom. Instead they are logically necessary corollaries of the very idea of a free will which come into historical existence as these different aspects of consciousness separate themselves out. Working to an agenda set very much by the French Revolution, Hegel defined freedom as the historical movement of will from mere potential and contingency towards its differentiated concrete embodiment in institutions. Attempts, such as those of the Jacobins, to appeal directly to abstract standards - ‘the revolutionary will’ - therefore courted a destructive anarchy. For Hegel the will finds emancipation when it recognizes the differentiated structures of the modern state as its own product. Another, only questionably political, view would be taken by Nietzsche for whom self-creativity required the individual will to power to overcome all ‘given’ contexts, natural or historical; failure to do so would reinforce a ‘slave’ mentality of subjection (see Nietzsche, F.).

Hegel’s development from the *Phenomenology* to the elements of the *Encyclopedia of the Social Sciences* including the *Philosophy of Right*, represents an increasingly abstract - although always historicized - account of what was, in his initial writings, a deeply socially embedded history of consciousness. The political legacy of his philosophy was extremely ambiguous, since the claim that historical progress represents the working out of reason in the world could be read either as an endorsement of the status quo or as an exhortation to subject it to rational criticism. However, since Hegel’s conception of reason was supposed to be inscrutable to those acting on its behalf, the former reading is the more plausible.

Largely for political reasons, the battle over Hegel's legacy was fought in terms of the philosophy of religion. A series of commentators - David Strauss, Ludwig Feuerbach and the young Karl Marx - sought to interpret religion, which Hegel had described as 'truth in a veil', as a representation of the rationality or irrationality of the life of its own society. While Feuerbach saw Christianity as mystified anthropology and the incarnation of Christ as an allegory of the religious form assumed by humanism, he was unable to explain why humanism should have taken this form in the first place. In the early writings of Marx he argued that the sources of religion, as an alienated form of consciousness, could be traced to social deformations of man's essentially creative nature, which Marx located in the economy. Marx interpreted Hegel's historical schema of the alienation of mind from its own intellectual products as a mystified account of the alienation of humanity from its own material products. This entailed in turn a series of alienations - from creative activity (experienced as drudgery), from other humans (experienced as material factors or competitors), from nature (experienced as something to be subjected) and from men's own philosophical identity or 'species being' (as collective creators) (see Alienation).

The consequence of this alienated activity was a structure of alienated and alienating institutions, the primary political feature of which was the class dominance of those effectively controlling the means of subsistance. The state - on Hegel's account the 'presupposition of civil society' - was shown instead to be a product of civil society, and thus dependent on the balance of class power. In the words of the *Communist Manifesto*: 'the executive of the modern state is but a committee for managing the common affairs of the whole bourgeoisie'.

Although Marx arrived at his revolutionary position through an internal critique of idealism, and such language persisted in his writings, his actual analysis of historical processes, and of the particular form of society then prevailing, owed much to the Scottish historical sociologists and the political economy spawned by Smith's *The Wealth of Nations*. The conception of social evolution through stages characterized as different 'modes of subsistence', and the notion of the social production of ideas and institutions intrinsic to and functional for each stage, was vital to his historiography. Equally the development, from Smith to Ricardo (interpreted by Marx as a development in objective economic circumstance), of a terminology for analysing the creation and distribution of value, was vital to his critical economics and to his projections about pauperization, shifts in social structure, demand failure and the falling rate of profit, which he claimed would immobilize capitalism as a means of deploying resources and generating wealth.

The young Marx had criticized capitalism for denying the human essence - what he viewed as a collective rational creativity. The mature Marx self-consciously eschewed metaphysical ideals. His socialism was scientific in the sense of claiming to rest on an objective analysis, whereby competition amongst capitalists would gradually increase the division of labour and reduce the labour factor of production, simultaneously diminishing profits (which on Marx's analysis ordinarily represented surplus value created by labour), reducing demand and swelling the ranks of the unemployed and unskilled workers. Revolution would occur when profit rates were too low to generate investment despite the huge productive potential developed by capitalism. Production would have then to be organized socially - which only the dispossessed workers would be willing to do.

Classical Marxism retreated under the combination of theoretical developments in economics - principally marginalist analysis - and political developments in early twentieth-century western Europe, especially the advent of social democracy. Its Leninist version, which sought to apply Marxism to newly industrialising states as vulnerable points in capitalism conceived of as an international system, survived as an ideology of Soviet imperialism in eastern Europe and anti-imperialist movements elsewhere, but largely ceased to generate serious philosophical work (see Marxism, Chinese; Marxist philosophy, Russian and Soviet; Marxist thought in Latin America; Marxism, Western). Varieties of Marxism continued to inspire political analysis, however, notably that associated with the Frankfurt School (see Critical theory; Frankfurt School).

Most of the major languages of political theory have similarly survived to the present, albeit in changed or often hybrid form. Thus Rawls' synthesis of utilitarian and Kantian perspectives is enmeshed in a debate with a variety of communitarian approaches with debts to revived Aristotelian or republican language, and with secularized versions of natural rights language and contractarian theory (see Gauthier 1986; Contractarianism). Wholly new challenges to these adaptations of traditional languages are to be found in the voices of feminist theorists who have offered strikingly unfamiliar and rewarding perspectives on what were thought to be well understood historical texts, as well as a different agenda for contemporary political philosophy.

Political philosophy, Indian

While Western political theory has been framed as the struggle between the state and the individual, Indian political philosophy has been more concerned with issues of self-liberation, morality and leadership. Until recently, with the advent of institutionalized or syndicated Hinduism, Indian society made a softer distinction between state and religion. Classical Indian political theory, as with Kauṭilya, centred on axioms on how to maintain and expand power. Kauṭilya argued that reason, the edicts of the king, and his own rules of governance, the Arthaśāstra, were as important for decision-making as the ancient religious treatises, which defined social structure and one's duty to family, caste and God. With the exception of the Arthaśāstra, politics was expressed through the ability not so much to govern as to define social and moral responsibility, what one could or could not do and who could oversee these rules.

Like all civilizations, India had periods of rule by accumulators of capital and traders, warriors and kings, and Brahmans and monks; there were also revolts by peasants. Still, philosophy was in the hands of the Brahmans, the priestly class. This philosophy was primarily not about artha *(economic gain) or* kāma *(pleasure), but about* dharma *(virtue) and* mokṣa *(liberation from the material world). The attainment of salvation, of release from the bonds of karma, was far more important than the relationship between the individual and the sovereign, as was the case in Western political philosophy.*

1 Historical background

While the European Enlightenment was considered the end of Church power and the beginning of secular power, of humanism and liberalism, there was no similar Enlightenment in India. This is not to say that there was no tension between king and Brahman, between state and religious authorities; indeed, Nicholas Dirks (1987) writes that the central conundrum in Indian history has been who should rule: the Brahman or the *kṣatriya* (warrior)? Kauṭilya focused more on coercive power and less on interpretive power. In contrast, the Buddha, committed to interpretive power, remained silent when questioned whether the *ātman* (the individual soul) and Brahman (the Cosmic Consciousness) exist. Understanding that a positive response would reify the self, returning its control to the Brahmanical class, he opened up the self and consciousness to more liminal spaces. Furthermore, recognizing that official state power was largely circumscribed by priestly power, he focused less on royal power and more on the spiritual community (*saōgha*) and on right livelihood as a way of social transformation.

Thus, instead of the search for a perfect society, of the linear march and inevitable victory of democracy and progress, the regulation and liberation of the self has been far more important. It is this self and its emancipation from personal and social history that has been the centre of Indian philosophy. Indian political thought, however, should not be seen as fundamentally despotic, with authoritarianism the rule. Indeed, P.R. Sarkar (1987) makes the controversial claim that democracy first originated with the Licchivis of Vaiśālī, a clan that flourished over 2,500 years ago. They developed a written constitution, abolished the monarchy and, through elections, formed an executive body.

However, while in Western political theory the assumption of man as evil led to the system of federalism, to checks and balances of power, in India neither evil nor good was assumed. *Vidyā* (introversion, leading to enlightenment or good) and *avidyā* (extroversion, leading to degeneration or evil) remain in constant struggle, both simultaneously present. Evil was explained as ignorance, as *māyā*, not as an embodied force. The ideal leader is the one who can lift the veil of untruth, transcend this duality (or at least minimize *avidyā*) and thus become the moral and spiritual leader. In contrast, Islamic political theory has been saddled with the problem of reattaining the perfect state achieved during the time of the Prophet (see Political philosophy in classical Islam). India did not have such a historical event; only Rāma Rājya, the mythical kingdom of Rāma, where food was abundant and all lived in peace, had utopian connotations. But it was only in the twentieth century that this imagined polity became a political platform, largely in response to the utopias of Marxism, liberalism and Islam. Still, for Indians it is not so much a secular state that is desired (one that is amoral, efficient and fair) but a pluralistic state that does not take sides with religions, thereby enabling authentic cultural plurality.

2 Temporal dimensions

Whereas Western political philosophy creates a division between the religious and the secular, between Church and State, Indian (and Chinese) philosophy, based less on monotheistic, highly structured religions, and more on direct intuitive experiences of the mysterious, has found this to be unnecessary. A different temporal orientation is also taken. Instead of a linear movement from ancient, to classical or feudal, to modern (scientific, rational, nation-state-oriented), or from religious, to philosophical, to scientific, as with Auguste Comte, there is a complex historical cycle with different temporal levels. At one level, there is the cosmic time of the stars and gods; at another level, there is the fourfold structure of student, householder, active citizen, and renunciate; at the societal level, there is the rise and fall of society, a process which involves the degeneration of righteousness from the golden, to the silver, to the copper and then to the iron. In the iron age, the *avatār*, or redeemer, brings all back to *dharma* and the golden era (*satya-yuga*) begins again, but with the silver around the corner. This was the promise of Kṛṣṇa to be reborn whenever virtue declines. At the level of the individual, Indian philosophy is the story of karma, of endless births, with escape only possible through enlightenment (see Karma and rebirth, Indian conceptions of). Instead of utopia pulling society forward, 'eupsychias' (ideal places of the mind) have been more prevalent. However, even as the self has been central, history has been dynastic, consisting of epics and myths, of ages and episodes, not of the workers' struggle, as recent Marxist Indian philosophers have argued; structure has been far more important than agency.

Traditional Indian historiography has framed the past as Hindu (Vedic), Muslim and Modern (British rule and then Independence). However, unlike the Western scheme there is no pretence that prior eras are stepping stones to the present, no overarching theory of scientific progress. This is not to deny the reformist urges throughout Indian history, and particularly the efforts of Raja Rammohun Roy (see Brahmo Samaj) and Aurobindo Ghose, but rather to argue that moral philosophy has been more central than the massive social engineering of Marxism or the amoral market mechanisms of liberal capitalism. Even when utopia has been imagined, such as Rāma Rājya, it has been done with the past in mind, not with the pull of the future.

3 The Indian episteme

Indian political theory should not and cannot be divorced from the Indian episteme, the boundaries of knowledge that contextualize what is knowable. The liberation of the self is the centrepiece of this system. Doing so frees one from karma and helps one to live in *dharma* and achieve *mokṣa*. Truth is considered not so much as accuracy or fidelity to the empirical but as therapy, as that which reduces suffering. In this sense, classical Indian philosophy is postmodern, with reality consisting of many levels and different traditions and philosophies touching these levels - true epistemological pluralism. Truth is thus 'both/and' instead of 'true and false'. This means that contradictions are tolerated. Moreover, there are many ways of knowing the world: devotion, reason, sense-inference, authority and intuition (see Knowledge, Indian views of). The physical universe and the mental universe are considered symmetrical: as above, so below; as inside, so outside. Individual and cosmos, body and mind, self and society are linked together. Politics and religion are thus not separated but linked. There is a holistic unity of discourse, with truth ultimately residing in the individual, even though Brahmans and rulers have attempted to have authority vested in caste and state. Philosophical systems are also grand, touching every level of existence from bathing to political economy, world order and cosmic meaning. Order and elegance are as important as accuracy in the Indian episteme. This episteme itself is not questioned, but is the given in Indian philosophy.

Unlike other epistemes, which undergo dramatic shifts, the Indian episteme is additive. New discourses are added, changing the episteme and Indianizing the new discourse. Modernity, of course, is threatening to force the classical pluralism of Tantra, Vedānta, Buddhism and Islam to fit into the straitjacket of nationalism, of one people, one guru or one god. This has led to a politics of structured religion, to the creation of a 'Hinduism', a religion linked to national identity. In this realist model, it is the state and its functionaries that are most important. Reality is not moral or spiritual, but about capturing power so as to ensure that the identity of and material gains for one's community or nation are maximized. The self is no longer devoted to selfless service (*sevā*), but to maximizing wealth and power. In this self, the Other is to be feared: the Other is the enemy, not to be embraced, as Gandhi argued, but used for personal gain. However, while in the short run Hindu nationalism may become hegemonic, its exclusionary tactics will most likely self-destruct. It will 'other' itself. In the long run, the ecology of cultures and traditions that is India will soften modernity's univocal claims, making it but one view among many.

4 *Varṇa*

The ‘Other’ has generally been more those of a different class than those of a different religion, since Indian religious and philosophical traditions are syncretic and universal. It is *varṇa* (social division; literally ‘colour’) that both orders society and creates structural problems for social justice and transformation. While *varṇa* for Orientalists is an all-encompassing social structure, others have argued that Indian society is no different from other historical societies, where agency has existed at times with individuals, at times with religious authorities, at times with traders and at times with the military. Caste is one category, but not the final category of analysis. Defenders of caste have argued that it is one among many ways of ordering the world - of engaging in politics. Politics is about the negotiation of power and meanings. While modernizers want to rid India of caste, they forget its relationship to order, with caste basically creating a permanent underclass, as in other societies. For the political theorist Rajni Kothari (1970), more important than *varṇa* is *jhat*, the myriad associations, relationships and lineages that are perceived as caste.

For Gandhi, the task was to make everyone into *śūdras* (peasants) to create a society with equal distribution. His was a devastating critique of modernity and instrumental rationality, not of technology, as commonly thought. For Gandhi, self-reliance is the road and the goal. One cannot distinguish between ends and means. This counters the classical position of the *Bhagavad Gītā*, where, in certain situations, violence is allowed, especially since at the level of the Absolute, victim and victor are united in destiny.

The legacies of Gandhi are many. Two are critical: self-reliance rather than instrumental rationality - that is, humans should work together to build small-scale communities - and nonviolence. In conflicts, it is nonviolence that is victorious since it touches the heart of the oppressor, thereby transforming the oppressor. Indeed, for Gandhi, history itself is the march from violence to nonviolence, from barbarism to civilization.

5 Structure, history and the cycle

The work of P.R. Sarkar (1921-90) is an alternative to the critical traditionalism of Gandhi and the reforming efforts of Aurobindo. Sarkar attempts to develop a political theory that has structure (historical patterns), agency (the role of individuals and leadership) and superagency (the role of divine intervention). For Sarkar, there are four types of power: the economic, or *vaiśyan*, the coercive/protective, or *kṣatriyan*, the normative/ideological, or Brahman, and the chaotic/disruptive, or *śūdra*. Sarkar derives these from the classical Indian social system of *varṇa*, but reinterprets them not as biological caste categories but as evolutionary, psychosocial paradigms.

These four types of power are related to four historical ages: the age of workers, the age of warriors, the age of intellectuals and the age of capitalists. At the end of the capitalist era, there is a workers’ revolution; this leads to a centralization of power, from which evolves an age of warriors, in which there is a centralized polity. Each age has it own contradictions, and by denying the other forms of power, each era naturally leads to the next. These are not ideal types, nor is Sarkar’s cycle a defence of current modernity, as with the historian Buddha Prakash, who argues (1958) that the current age is the Golden Era - rather than an *avatār*, independence and industrialism have awakened India after centuries of oppressive sleep.

Sarkar does not intend to end the cycle of history - it is not societal perfection he seeks - but he hopes to minimize the exploitation in each era through the development of a new type of leader, the *sadvipra*, one with a complete and pure mind. The *sadvipra* exists in a context not of state or individual, but of *samāj*, or family: a selfless family on a collective journey through life. Through such leadership, Sarkar envisages a new society committed to gender coordination, self-reliant cooperative economies, and *pramā*, a dynamic balance between physical, mental and spiritual potentials.

However, unlike classical political philosophy, where the sage exists *outside* traditional constructs of power (being neither Brahman nor *kṣatriya*), in Sarkar’s model, this new type of power - protective, service-based, innovative and interpretive - is placed at the centre of the wheel. Like Aurobindo with his yogocracy and Gandhi with his *satyāgrahī*, Sarkar develops the ideal of a modern yogi. This, however, is not the religionization of politics but its spiritualization, the aim that Aurobindo and Gandhi struggled to achieve.

But for Aurobindo, history is not structural but idealistic, a process in which the Godhead enters individuals and communities. Thus, following Hegel, nationalism becomes part of the manifestation of the soul, of the divine

drama. It becomes an extraordinary event that represents the will of Consciousness in creating a better human condition. For Aurobindo, God works not only through *avatārs* such as Kṛṣṇa, but also through nationalistic and other movements as well.

6 Postcolonial discourses

More recent Indian political theory has been concerned with creating a post-colonial self, with ridding India of the intimate enemy of the British history. This is not a history of dynasties or of large meta-narratives, but a history of the subaltern, of women, of the epistemologically oppressed, as developed by writers such as Ashis Nandy, Ranajit Guha, Vandana Shiva and Gayatri Spivak. This rewriting of India has been a search for a historically grounded India not overlaid with spiritual essences, for a politics of individuals and communities struggling to create a new self, an often localized identity that has meaning in its own mythological, cultural and economic context. Development, science and instrumental rationality are criticized as violent, disempowering of communities and dangerous to the environment.

Borrowing from postmodernist critiques of the construction of identity, the categories of 'Hinduism', 'caste', 'Mother India' and 'nation' are questioned. The politics of how these discourses are used by state power further to regulate, militarize and homogenize society are deconstructed with the intention of rescuing the plurality of truth that has typified Indian philosophy.

Political philosophy, nature of

Political philosophy developed as a central aspect of philosophy generally in the world of ancient Greece, and the writings of Plato and Aristotle made a basic and still important contribution to the subject. Central to political philosophy has been a concern with the justification or criticism of general political arrangements such as democracy, oligarchy or kingship, and with the ways in which the sovereignty of the state is to be understood; with the relationship between the individual and the political order, and the nature of the individual's obligation to that order; with the coherence and identity of the political order from the point of view of the nation and groups within the nation, and with the role of culture, language and race as aspects of this; with the basis of different general political ideologies and standpoints such as conservatism, socialism and liberalism; and with the nature of the basic concepts such as state, individual, rights, community and justice in terms of which we understand and argue about politics. Because it is concerned with the justification and criticism of existing and possible forms of political organization a good deal of political philosophy is normative; it seeks to provide grounds for one particular conception of the right and the good in politics. In consequence many current controversies in political philosophy are methodological; they have to do with how (if at all) normative judgments about politics can be justified.

1 Universalism in political philosophy

A central question in the history of political philosophy has been the concept of the political itself, and therefore the range of actions which can and should be subject to law and coercive interference. Political philosophers have tried several argumentative strategies in their attempts to provide a solution. One such strategy, which has taken many different forms, has been to invoke a conception of human nature (see Human nature). If we could reach a good understanding of human nature and basic human needs, desires and purposes, we could then devise the appropriate set of political arrangements which would best meet them. Sometimes such conceptions of human nature have in turn been set against much wider philosophical theories about the place of human nature in the cosmos (as for example in Plato, Augustine and Aquinas); sometimes in relation to God specifically, as the creator who endowed persons with the nature they have (as for example in the writings of Calvin or, in a more limited way, Locke); sometimes in a view of the place of human beings in the natural order (as for example in Hobbes, or Aristotle via his writings on the relationship between man and the biological order); or in an account of how human needs and powers develop in history (as in Hegel and Marx). Equally, some conceptions of human nature as a basis for political organization have been much more limited and empirical in form (as for example in the utilitarian writings of Bentham, who took as a fact of life the propensity of human beings to seek pleasure and avoid pain). Despite all of these differences, we may find a similar strategy being adopted; namely, that in order to justify a particular set of political arrangements we have to understand the basic needs, drives, desires, interests and purposes of human beings and then argue from these to a proper understanding of the appropriate nature and role of politics in human life.

It follows from this view that the claims of political philosophy are both universal and foundationalist. They are universal in that most political philosophers have assumed that their claims about human nature and the concomitant understanding of politics, society and the individual are quite general in scope and not restricted to an understanding of human nature in the context of a particular culture and society. They are foundationalist in the sense that a conception of the good political order is taken to rest upon an objectively true account of human nature. In addition, political philosophy has frequently been regarded as teleological in character, directed towards goals set by the nature of what it is to be human and the kind of political organization which will fulfil human nature as we understand it.

2 The critique of political philosophy

This conception of political philosophy has met with fierce criticism during the twentieth century, to the extent that in the middle years of the century political philosophy as a normative discipline was regarded as dead. There were various reasons for this. One central reason has to do with the claimed relationship between philosophical prescriptions about the good society and its political form, and the basis for such judgments in accounts of human nature. Following the lead of David Hume, many empiricist philosophers have argued that there is a logical gap

between any account of human nature and the evaluative and prescriptive consequences which are thought to derive from this (see Fact/value distinction). On this view there cannot be anything in the conclusion of a valid argument which is not present in the premises. If a theory of human nature is supposed to be empirically grounded, that is to say testable or verifiable by empirical investigation, then such a set of empirical propositions about human nature cannot support evaluative conclusions about political organization. (This is sometimes known as the is/ought gap.) This claim has frequently gone alongside the claim that the theories of human nature with which political philosophers have operated have not been strictly empirical but rather have been constructed with a strong evaluative dimension built into them - that, for example, some human needs or human purposes have higher moral priority over others. On this view, the reasons why political philosophers have thought that their theories of human nature have supported evaluative conclusions is that the theories themselves have contained ineliminable evaluative elements. The upshot is that theories of human nature cannot provide a secure foundation for political philosophy, because either they are empirical theories which will not support normative conclusions or they are themselves normative and stand in need of justification.

This objection to the strategies followed by normative political philosophers has been reinforced by a growing sense of the subjectivity of values. Sometimes this is taken as a sociological observation - that it is as a matter of fact that the modern world is marked by the view that moral values are matters of subjective preference. If this is so neither normative political philosophy nor the normative understanding of human nature with which political philosophers have worked can be given an objective foundation. Moral judgments, whether they apply to theories of human nature encompassing accounts of human needs and purposes and the priorities between them, or directly to the nature and scope of politics, are matters of subjective preference.

Equally, attempts have been made by philosophers such as the logical positivists who flourished in the 1930s to provide an elaborate justification for understanding moral judgments in a subjective and emotive way (see Logical positivism; Emotivism). The positivists argued that apart from the truths of logic and mathematics, which are tautologies (that is to say, hold by definition), the only meaningful statements are those which are in principle empirically verifiable, as for example the propositions of natural science and everyday empirical observations. This led them to the view that moral judgments, including those made about the nature of politics, have no cognitive content, convey no information. Rather they embody or evince the emotional attitudes of those who make the judgments. In this sense moral judgments are irredeemably subjective.

In the same vein it was argued that political philosophers, particularly utilitarians such as Bentham and J.S. Mill, had committed what G.E. Moore called the naturalistic fallacy when they attempted to give normative conceptions such as good and bad an empirical definition in terms of pleasure and pain (see Moore, G.E. §1). These conceptions are not extensionally equivalent because it is always possible to say ‘this is pleasant, but is it good?’, a question which would make no sense if the words denoted the same thing. Again, this would mean that it is impossible to give an empirical basis to normative reasoning about politics.

These philosophical arguments about the limitation of empirical justification for normative conclusions reinforced the idea that normative judgments are subjective. If this is so then the project of normative political philosophy has to be abandoned. There can be no foundationalist or universalist basis for political judgments. If political philosophy has a role at all it is very modest and involves conceptual analysis - that is to say, clarification of the concepts that might be used in empirical political science with a view to purging such concepts of evaluative, and therefore subjective, overtones.

3 The communitarian response

Over the past thirty years, however, there has been a vigorous resurrection of political philosophy. How have political philosophers felt able to engage in a discipline which had looked nothing more than a pseudodiscipline, merely recording the consequences of the moral predilections of the theorists themselves?

Several factors have contributed to the revival. It has not proved possible to produce a watertight account of the principle of verifiability central to positivism, whose aim was to provide a clear criterion in terms of which the empirical and the non-empirical could be demarcated. Partly because of this, and partly under the influence of Wittgenstein’s later writing, there has been much more attention paid to the meaning that terms have in particular contexts (including the moral and political), than to any attempt to impose some kind of antecedent standard of

meaningfulness on language. This has freed political philosophy to consider, for example, the meaning which a term such as ‘justice’ might have in different discourses, contexts and communities, rather than trying to establish its meaning a priori (see, for instance, Walzer 1983).

Those who wish to link analysis in political philosophy to the interpretation of the communities and networks within which values and principle have their meaning have come to be called, in one contemporary usage of the term, ‘communitarians’ (see Community and communitarianism). This approach to political philosophy does not aim to justify values and principles in some foundationalist or universalistic sense, but rather to interpret (in a way that goes beyond surface description) the values which animate a particular society, or specific communities or discourses within it. It side-steps the problem of justification posed by the positivists and others who regard values as subjective. It eschews the idea of providing some kind of universalistic foundation for political values, rooted, for example, in a theory of human nature. It takes communities and the social meanings embodied in communities and other ways of life as basic and seeks to interpret them.

Another reason for the revival was that the underlabourer role to which positivism consigned political philosophy - providing central definitions of political concepts to be used in empirical political analysis - proved impossible. The evaluative component of political terms is not a peripheral and detachable feature, but is central to the meanings which these terms have in particular discourses, ideologies and communities. This perception is linked to the idea that basic social and political concepts are essentially contestable (Gallie 1956). This is the view that such concepts cannot be given some wholly neutral, value-free, experiential definition; rather, their meaning is bound to different ways in which different discourses and communities construe human purposes, human interests and human flourishing.

Recognizing this may lead us to two alternative conclusions. The first limits political philosophy to description and interpretation. Given that political concepts are essentially contestable, and that they are contested because their meaning is relative to a particular discourse or ideology, then all that political philosophy can do is describe the role which the concept plays in one discourse and explain how its meaning differs in others (see Ideology §4). On the other hand, if a political philosopher wishes to do more than trace how a political concept relates to a wider network of beliefs and values, and instead wishes to offer some basic justification for using that concept in a particular way, then that must involve privileging one way of thinking about human interests and purposes over another. This would take the subject back to its more traditional form, that is reflecting on human purposes and the nature of human flourishing and endorsing a set of political values which would facilitate this.

The problem here is how to ground a normative theory of politics in circumstances where people disagree about their conceptions of the good. In so far as this dilemma has been solved in contemporary political philosophy it has been in one of two ways. The first has been to put, as John Rawls (§4) argues: ‘the Right before the Good’ (Rawls 1971). That is to say, we can recognize that citizens differ about what they take to be good in human life, but nevertheless they have an interest in the justice of the political framework within which they pursue their own diverse goals. One can argue that it is possible to produce a compelling account of the rules of justice within a diverse society by making some rather minimal assumptions about certain basic human goods which all people are assumed to want more rather than less of, whatever else they may think is good in life; and then to invoke some general principles of rationality to decide upon rules governing the distribution of such ‘primary goods’. Theories of this kind aim to justify a political order by reasoning on the basis of slight assumptions about human goods, while recognizing the pervasive nature of moral diversity in relation to more specific human goals and purposes.

The other main approach to the problem of justification has been to emphasize the idea of dialogue in politics, and to explore the conditions for free and rational dialogue about basic political precepts. Here again is recognition of the problem of philosophical justification of principles in a situation of moral diversity, and the response is to ask under what conditions rational and noncoercive dialogues about political goals could take place. Examples of this sort of approach are to be found in the work of Ackerman (1980) and Habermas (1987).

Contemporary political philosophy does not have a settled nature. Following the challenge of positivism, it has become much more reflective about methodology, but as the different approaches of communitarians and foundationalists illustrate, there are still profound differences about the scope and ambition of political philosophy. Is it to be engaged in justification or interpretation? Is it concerned with universal values or the values of particular communities? Are the problems of moral diversity to be resolved by invoking minimal assumptions about human

nature and applying formal modes of reasoning to these, or by grappling with this diversity as it manifests itself in the different interpretations of values in a particular society?

Pomponazzi, Pietro (1462-1525)

Pietro Pomponazzi was the leading Aristotelian philosopher in the first quarter of the sixteenth century. His treatise De immortalitate animae (On the Immortality of the Soul) (1516) argues that although faith teaches immortality, natural reason and Aristotelian principles cannot prove it. In De incantationibus (On Incantations) (first published in 1556), Pomponazzi attempts to demonstrate on rational grounds that all reported miraculous suspensions or reversals of natural laws can be explained by forces within nature itself. Separating faith and reason once again, Pomponazzi proclaims his belief in all canonical miracles of the Church. These arguments cast doubt on morality, for without an afterlife, humanity is deprived of rewards for virtue and punishment for evil; and nature itself appears to be governed by impersonal forces unconcerned with human affairs. However, morality is restored to the universe by the human powers of rational reflection which lead to the pursuit of virtue. Yet in De fato (On Fate) (first published in 1567), Pomponazzi challenges the very basis of his own ethical doctrine by arguing that all activity of insentient and sentient beings is directed to preordained ends by environmental factors. Unable to justify human freedom on rational grounds, he then seeks to re-establish it using arguments derived from Christian natural theology, thus reversing his usual separation of faith and reason.

1 Life and works

Pietro Pomponazzi (Petrus Pomponatius) was born in Mantua. His adult life was spent as a professor of natural philosophy at the Universities of Padua, Ferrara and Bologna, where he was admired by his students and paid well. Many of his unpublished lectures and questions survive because students, impressed by their intellectual rigour, copied and recopied them. Pomponazzi's most productive years were spent at the University of Bologna where he taught from 1511 until his death. During this period, he published the immortality treatises, *De immortalitate animae (On the Immortality of the Soul)* (1516), *Apologia* (1518) and *Defensorium* (1519), and wrote but did not publish *De incantationibus* and *De fato* (each written in 1520 but published posthumously in 1556 and 1567 respectively).

2 Immortality

Pomponazzi's most famous work, the treatise *On the Immortality of the Soul* (1516), encloses the philosophic argument in a conventional fideistic shell. At the beginning and end of the treatise, he remarks that the doctrine of immortality must be accepted as revealed truth, certain and indubitable; all contrary arguments are false (see Soul, nature and immortality of the §2). The philosophic core of the treatise, however, argues strongly for mortality on rational and Aristotelian grounds. The philosophic argument holds that only the intellect, the highest part of the soul, is capable of surviving the body. Proof of this survival must be found in an activity of the intellect that functions without bodily dependence. No such activity can be discovered, however, because the highest activity of the intellect, the attainment of universals in cognition, is always mediated by sense impressions. Thus even the highest power of intellection is always directly linked to and sustained by the sensitive powers which, in turn, are dependent on the vegetative power. All sources agree that the sensitive and vegetative powers weaken and perish, and hence the intellect, although immaterial in itself, must perish with them. The whole soul therefore dies with the body.

The philosophic doctrine of mortality thus stands in direct opposition to the religious doctrine of immortality. Is Pomponazzi proclaiming the simultaneous truth of two opposites? Some contemporary critics claimed that he asserted the notion of a 'double truth': the doctrine of immortality can be simultaneously true in theology and false in philosophy. However, there is no evidence to support such a claim. He held to only one truth but whether that was the truth of faith or philosophy is open to question. There is good reason to believe that Pomponazzi maintained the absolute truth of philosophy. In discussing the origin of the doctrine of immortality, he notes that religious lawmakers asserted immortality 'not caring for truth but only for righteousness'. Apparently, the truth the religious lawmakers 'do not care for' is the philosophic doctrine of mortality.

On Immortality provoked an immediate furore. Public attacks on Pomponazzi culminated in a warning by Pope Leo X demanding that he disavow the doctrine of mortality and bring his position in line with the decree of the Fifth Lateran Council (1513) which had declared the immortality of the soul to be a dogma of the Church. The intervention of Pomponazzi's powerful friends in the Church allowed him to continue teaching and to publish

replies to his critics. The attacks were accompanied by a spate of books written against Pomponazzi, who wrote two works in his own defence. In his *Apologia* (1518) he replied to Gaspar Contarini and in *Defensorium* (1519) he answered Agostino Nifo (§1). Although more elaborate and diffuse than the original treatise, these works do not alter Pomponazzi's basic position. A full-scale attack came from the prominent Dominican theologian Bartolomeo de Spina. He alone charged Pomponazzi with heresy and demanded an Inquisitorial trial. His call went unheeded. Spina wrote two books against Pomponazzi but the first one, *Tutela veritatis de immortalitate (The Whole Truth Concerning Immortality)* (1519), is probably the more significant. Noting Pomponazzi's assertion that immortality is the invention of religious lawmakers, Spina concludes that Pomponazzi's attitude is not that of a believing Christian.

This issue continues to divide Pomponazzi's interpreters. If, as Pomponazzi always says, revelation proceeds from supernatural truths beyond rational discourse, it follows that reason cannot invalidate any proposition of faith. This fideism, many scholars argue, is certainly compatible with faith so there is no reason to doubt Pomponazzi's sincerity (see Kristeller 1964). Others have reached a different conclusion (see Pine 1986). Citing Pomponazzi's constant identification of philosophy with truth and religions with social convention, they argue that he stressed the importance of religions as a force producing social cohesion but lacking in speculative veracity. The association of truth with philosophy is particularly striking in his idealization of the philosopher as one who is isolated, derided and persecuted for his lonely struggle towards virtue and truth.

3 Miracles

Pomponazzi's investigation of miracles, *De incantationibus*, was written in 1520 but published posthumously in 1556. The decision to leave the work unpublished probably stemmed from Pomponazzi's concern for his own safety after the immortality controversy.

The philosophical discussion of miracles, proceeding by rational argument alone, is again enclosed in a fideistic shell, professing belief in all canonical miracles of the Church. Yet the philosophical discussion discovers natural causes, first for contemporary events deemed miracles, then for biblical miracles, and finally for the miracles specifically related to the founding of all religions. Thus Pomponazzi concludes with a natural basis for religion itself, which now becomes the effect of the workings of the Intelligences, divine impersonal forces moving the heavens, rather than the fiat of a personal deity.

Many supposedly miraculous cures and visions produced by magicians and divine messengers undoubtedly occurred, says Pomponazzi. Yet they all have perfectly natural explanations. Naturalistic accounts are also applied to biblical events, casting doubt on the miracles of Moses, Elisha and Christ. After the discussion of particular miracles, religion itself is depicted as a product of the Intelligences and subject to the eternal cycles of birth, growth and decay. At its birth, a religion is favoured by the Intelligences. It is at that point that the heavens, directed by the Intelligences, produce 'sons of God', men possessing the ability to command nature. But as the natural process develops, every religion grows weaker and eventually dies. Christianity itself is dying, having reached the end of its life cycle.

The doctrine of a universe without miracles, says Pomponazzi, cannot be spread to the vulgar. They must still believe that a providential God, angels and demons are the causes of 'miraculous events'. But the philosophical elite knows that these are 'fictions' designed to lead men to virtue (see Miracles).

4 Morality and freedom

Pomponazzi's conception of morality is based on the free choice of the individual. That choice is free only when the passions are subdued and reason is ascendant. Since only the philosophic elite is capable of dominating the passions, they alone are truly free. Through reason they understand that virtue is its own reward and vice its own punishment. The masses, ruled by their passions, are subject to environmental and planetary forces eliminating their freedom.

The centrality of the concept of freedom in Pomponazzi's thought is underlined by his insistence in the last book of *De fato* that freedom is a metaphysical necessity based on the Great Chain of Being. For that chain of being requires a nature differentiated both from the gods and from the lower forms of life, all of whose natures are fixed and hence without freedom of choice. The universe, he insists, requires a being whose nature is a product of free

choice rather than a fixed essence. Human nature is created by individual choices rather than a divinely given essence. This theme, asserted in various forms throughout Pomponazzi's works, is in contradiction to the determinism he forcefully defends in the first book of *De fato*. Thus the battle between freedom and determinism is at the very core of Pomponazzi's thought and is never fully resolved.

The attack on freedom in Book 1 of *De fato* takes the form of a defence of Stoic determinism (see Stoicism §20). Every event, Pomponazzi argues, is directed by an external cause which guides its internal nature to a predetermined end. Although we deliberate over moral alternatives, our choices are already determined by natural forces directing our wills. Yet after subjecting the will to environmental determinants, Pomponazzi undertakes a new attempt to save human freedom within a framework of Christian theology. This represents a surprising reversal of method since all of Pomponazzi's previous works have insisted that theology is not a legitimate concern of the philosopher who always proceeds 'within natural limits'. By combining doctrines derived from Aquinas and Duns Scotus, Pomponazzi attempts to rescue the will from environmental determinants, although he recognizes that his solution is not entirely satisfactory (see Free will §2).

When Pomponazzi moves from environmental determinants to the attributes of God, the problem is still more complicated. Pomponazzi discusses divine omniscience in the specific form of divine foreknowledge. Divine foreknowledge apparently precludes human freedom for if God infallibly knows all events before they occur, human deliberation about alternatives cannot affect the outcome. Any denial of this theological determinism implies that we can choose an alternative unknown to God. This impugns God's infallibility, as we would then have the power to falsify his knowledge. Here Pomponazzi draws on the Boethian-Thomistic solution which attempted to reconcile divine foreknowledge and human freedom by designating God's knowledge as 'timeless' (see Omniscience §§3-4). This timelessness is a total simultaneity in which all events are eternally present to God without succession. There is no future mode in God's eternal knowledge, for that would make divine knowledge indeterminate and possibly false. Pomponazzi qualifies this traditional view in an original way by asserting that God knows what is future to us in two ways: determinately and indeterminately. When any future event becomes past or present within the temporal flow, God knows this event as determinate. Such events are 'beyond their causes', with all their potentialities actualized so that God knows them determinately; they correspond to some settled actuality. This mode of divine foreknowledge Pomponazzi calls the future-as-present or future-as-past. Events which have not yet occurred within the temporal flow are designated the future-as-future. These events are by logic and nature unknown and unknowable. God's knowledge of them is uncertain in the sense that such an event is contingent. God's infallible foreknowledge is not destroyed by this contingent mode because he still possesses all temporal modes within his 'timeless' eternity. As God himself decides to prescind from the determinate modes of the future, he limits his future knowledge to pure contingency, thus allowing for the free operation of the human will. As unusual as this position is when compared to Pomponazzi's other teachings, it seems dictated by his recognition of the need to provide a metaphysical ground for ethics.

Pomponazzi's arguments are marked by the realization and admission of difficulty and paradox. His conclusions are attained only after the most complete elaboration of all possibilities. It is his tenacity in the face of complexity and honesty in the confrontation of difficulty that makes Pomponazzi, in Kristeller's words, 'one of the most difficult but also one of the most sympathetic and interesting of the philosophers of the Aristotelian school, of the Renaissance and of every age' (1983: 23).

List of works

Pomponazzi, P. (before 1516) 'Pietro Pomponazzi: Utrum anima sit mortalis vel immortalis' (Whether the Soul is Mortal or Immortal), ed. W. Van Dooren, Naples: Nouvelles de la République des lettres, 1989.(A fine critical edition with an analysis of *Pomponatius in Libros de Anima (Pomponazzi's commentary On the Soul)*. Set forth just before the *De immortalitate*, Pomponazzi here elaborated most major aspects of his theory which is developed more decisively in 1516.)

Pomponazzi, P. (1516) *De immortalitate animae*, trans. W.H. Hay II, *On the Immortality of the Soul*, in E. Cassirer, P.O. Kristeller and J.H. Randall, Jr (eds) *The Renaissance Philosophy of Man*, Chicago, IL: University of Chicago Press, 1948.(A reliable English translation of Pomponazzi's best known treatise. It

provoked the immortality controversy, arguing for the philosophic doctrine of mortality while accepting immortality on faith alone. Excellent footnotes by Kristeller and a useful introductory essay by Randall.)

Pomponazzi, P. (1525) *Tractatus acutissimi, utilimi et mere peripatetici (The Most Insightful, Useful and Fully Peripatetic Treatises)*, Venice.(The only collected edition; contains Pomponazzi's early works on physics, the three immortality treatises - *De immortalitate animae* (1516), *Apologia* (1518), *Defensorium Auctoris* (1519) - and the late work *De nutritione et augmentatione (On Nutrition and Growth)* (1521), which treats in part the problem of materialism in regard to the soul. With the notable exception of G. Zanier (1991), *De nutritione* has been neglected by Pomponazzi scholars.)

Pomponazzi, P. (1556) *De naturalium effectuum causis sive de incantationibus (On the Natural Effects of Causes or on Incantations)*, Basle.(An attack on miracles which finds natural causes for all miracles and then reduces all religious miracles to the effect of heavenly forces.)

Pomponazzi, P. (1567) *De fato, de libero arbitrio, praedestinatione providentia dei libri V (Five Books on Fate, Free Will, the Providence of God and Predestination)*, ed. R. Le May, *Libri quinque de fato, de libero arbitrio, de praedestinatione*, Lugano: Thesauris Mundi, 1957.(The most complex of Pomponazzi's published works. Beginning by arguing for Stoic determinism, the treatise then seeks to rescue free will, using arguments from Christian natural theology, and develops a novel theory of divine activity to rescue human freedom in light of divine foreknowledge and predestination. May provides an excellent critical edition of *De fato* with full references to all of Pomponazzi's sources, the manuscript literature and secondary sources.)

Pomponazzi, P. (1462-1525) *Studi su Pietro Pomponazzi (Studies on Pietro Pomponazzi)*, ed. B. Nardi, Florence: Felice Le Monnier, 1965.(A very important collection of articles. Nardi traces Pomponazzi's evolving position on immortality, reason and revelation, resurrection and miracles, with very full quotations from Pomponazzi's unpublished lectures and questions. The classroom comments on religious doctrines are often more critical than in the published works.)

Pomponazzi, P. (1462-1525) *Corsi inediti dell' insegnamento padovano (Unpublished Courses from the Paduan Teaching)*, ed. A. Poppi, Padua: Antenore, vol. 1, 1966; vol. 2, 1970.(Critical editions of Pomponazzi's lectures, demonstrating that Pomponazzi's basic position on immortality was developed around 1504. Other important issues (such as the *regressus* and universals) are discussed.)

(1995) 'Silvestro da Prierio and the Pomponazzi Affair', *Renaissance and Reformation*, new series, 19 (2): 47-61.(A fine discussion shedding new light on the role of Spina in the immortality controversy. Spina was clearly encouraged by Silvestro da Prierio, a high Papal official who was vehemently opposed to Pomponazzi and claimed he had been misrepresented in Pomponazzi's *Apologia*.)

Zanier, G. (1991) ‘La biologia teoretica del pensiero pomponazziano’ (Biological Theory in Pomponazzi’s Thought), in D. Facca and G. Zanier, *Filosofia, Filologia, Biologia: Itinerai dell’Aristotelismo cinquecentesco (Philosophy, Philology, Biology: Paths of 16th-Century Aristotelianism)*, Rome, 105-30.(The only work devoted to an analysis of major themes in the neglected *De nutritione et augmentatione* (1521). An interesting discussion taking full account of *De incantationibus* and *De fato*. The argument demonstrates that Pomponazzi still maintains mortality in this late work.)

Popper, Karl Raimund (1902-94)

Popper belongs to a generation of Central European émigré scholars that profoundly influenced thought in the English-speaking countries in this century. His greatest contributions are in philosophy of science and in political and social philosophy. Popper's 'falsificationism' reverses the usual view that accumulated experience leads to scientific hypotheses; rather, freely conjectured hypotheses precede, and are tested against, experience. The hypotheses that survive the testing process constitute current scientific knowledge. His general epistemology, 'critical rationalism', commends the Socratic method of posing questions and critically discussing the answers offered to them. He considers knowledge in the traditional sense of certainty, or in the modern sense of justified true belief, to be unobtainable.

After the Anschluss, *Popper was stimulated by the problem of why democracies had succumbed to totalitarianism and applied his critical rationalism to political philosophy. Since we have no infallible ways of getting or maintaining good government, Plato's question 'Who should rule?' is misdirected. To advocate the rule of the best, the wise or the just invites tyranny disguised under those principles. By contrast, a prudently constructed open society constructs institutions to ensure that any regime can be ousted without violence, no matter what higher ends it proclaims itself to be seeking. Couched in the form of extended critiques of Plato and Platonism as well as of Marx and Marxism, Popper's political philosophy has had considerable influence in post-war Europe, East and West.*

1 Life and works

Born in Vienna in 1902, the youngest child of a barrister, Karl Raimund Popper was educated at the University of Vienna, where he studied mathematics, music, psychology, physics and philosophy. He taught in secondary school between 1930 and 1936. Apprehension about Nazism persuaded him to emigrate in 1937, to become lecturer in philosophy at Canterbury University College, Christchurch, New Zealand. In January 1946 he became Reader in Logic and Scientific Method at the London School of Economics, was promoted to professor in 1949, and retired from full-time teaching in 1969. Among many honours, he was knighted in 1965, elected Fellow of the Royal Society in 1976, and made a Companion of Honour in 1982.

After a specialized start in the philosophy of science, Popper revealed himself as a philosopher of wide reach, making contributions across the spectrum from Presocratic studies to modern logic, from politics to probability, and from the mind-body problem to the interpretation of quantum theory. With all of his books in print, and translated into many languages, Popper's is one of the most discussed philosophies of the century. Yet, he insisted, his ideas are systematically misunderstood and misrepresented; this led him to devote uncommon energy to issues of interpretation and commentary on his own work.

Popper published three major works between 1935 and 1945. The first,*Logik der Forschung* (1935), his theory of science, appeared in English as *The Logic of Scientific Discovery* only in 1959. The second, *The Poverty of Historicism* (1957), first appeared in 1944-5 and extended his theory of science to history and society, severely criticizing the notion of historical laws. The third, *The Open Society and Its Enemies* (1945), is a two-volume treatise on the philosophy of history, politics and society.

Popper's other principal works consist of two collections of major papers, *Conjectures and Refutations* (1962), and *Objective Knowledge* (1972); a Library of Living Philosophers volume (1974) containing an intellectual autobiography and a set of replies to his critics, the former appearing separately as *Unended Quest* (1976); a collaboration with Sir John Eccles on a study of the mind-body problem, *The Self and Its Brain* (1977); *Die Beiden Grundprobleme der Erkenntnistheorie (The Two Basic Problems of the Theory of Knowledge)* (1979), the extant fragment of the book he was writing before *Logik der Forschung* superseded it; and the long-delayed *Postscript to the Logic of Scientific Discovery* (1982-3), much of which dates from the period 1955-7. Most of these books have seen multiple editions, involving sometimes minor and sometimes major changes. Throughout his career Popper also produced many original papers on diverse topics, and lectured all over the world. His manuscripts and correspondence fill some 450 archive cartons at the Hoover Institution, Stanford University.

2 Theory of science

Two problems structure Popper's theory of science: he calls them 'the problem of induction' and 'the problem of demarcation'. The problem of induction can be formulated: what relation holds between theoretical knowledge and experience? The problem of demarcation can be formulated: what distinguishes science from metaphysics as well as from logic and mathematics?

The received answers to these problems are: we get knowledge from experience by means of induction, that is, by inferring universal theories from accumulations of particular facts; and the inductive method demarcates science from metaphysics as well as from logic and mathematics. However, Hume showed that inductive inferences are invalid, hence the *problem* of induction: either we get knowledge from experience by invalid means (irrationalism) or we do not get any at all (scepticism); and induction collapses as a demarcation criterion (see Demarcation problem §1; Induction, epistemic issues in).

In Part I of *The Logic of Scientific Discovery*, Popper's solutions to these two problems are set out and shown to converge: knowledge results when we accept statements describing experience that contradict and hence refute our hypotheses; thus a deductive rather than an inductive relation holds between theoretical knowledge and experience. Experience teaches us by correcting our errors. Only hypotheses *falsifiable* by experience should count as scientific. There is no need for the inductive leap that Hume thought illogical but unavoidable; and the Hobson's choice between irrationalism or scepticism is avoided. To the question, 'where do hypotheses come from, if not inductively from experience?', Popper answers, like Francis Bacon, that they come from our propensity to guess (see Bacon, F. §6); in any case they cannot come from observation alone because there is no observation without hypotheses. Hypotheses are both logically and psychologically prior to observation. We are theorizing all the time in order to navigate in the world, and our encounters with negative evidence are the bumps that deliver information about the shape of reality.

The Logic of Scientific Discovery is dialectical in style, dealing with the traditional alternatives and the objections to each idea as it goes along. It is remarkable how frequently critics rediscover objections set out and answered in the book. The commonest objection is that, just as no amount of experience will conclusively verify a statement, so no amount of experience will conclusively falsify it. To answer this objection Popper points to a logical asymmetry. A universal statement cannot be derived from or verified by singular statements, no matter how many are marshalled. It can, however, be contradicted by one singular statement. The logic of falsification is the issue; conclusiveness is a red herring. Another argument, to the effect that the force of falsifying evidence can always be evaded by *ad hoc* definition or simple refusal to countenance it, Popper finds insuperable. The way to proceed, he concludes, is to entrench falsifiability in a methodology.

For Popper, a methodology is a policy decision governing action and embodied in norms or 'methodological rules'. Our decisions concern which course of action will best foster our aims. Thus falsificationism is made into a supreme rule to the effect that the 'rules of scientific procedure must be designed in such a way that they do not protect any statement in science against falsification' ([1935] 1959: 54). The rule for causality is typical of the small number offered: 'we are not to abandon the search for universal laws and for a coherent theoretical system, nor ever to give up our attempts to explain causally any kind of event we can describe' ([1935] 1959: 61). A broad epistemological ambition is revealed when Popper generalizes: 'It might indeed be said that the majority of problems of theoretical philosophy, and the most interesting ones, can be reinterpreted…as problems of method' ([1935] 1959: 56) (see Scientific method §2).

Throughout *The Logic of Scientific Discovery*, Popper defines his position by debate and contrast with logical positivist positions regarding meaning, and with two traditional views regarding science, inductivism and the conventionalism of Poincaré and Duhem (see Conventionalism §1; Logical positivism §4). It is notable that, like the logical positivists, Popper expresses unbounded respect for science. Unlike them, he grants a constructive (historical) role to metaphysics in science, seen as directly descended from the earliest Greek speculations about the nature of the world. The demarcation between science and metaphysics is thus a matter for decision, not a discovery about the nature of things. Popper's attacks on central logical positivist contentions contributed to the demise of that movement.

Popper respects conventionalism as self-contained, defensible and most likely consistent. His objection is that it risks treating obsolete or floundering science as incontrovertible truth. Yet Popper is a conventionalist in one respect: methodology. As opposed to the 'methodological naturalism' of the logical positivists, who treat the

demarcation between science and metaphysics as a difference existing in the nature of things, or rather, in the nature of language, Popper is a ‘methodological conventionalist’, proposing rules that embody choices or decisions - which are in turn governed by aims. His demarcation should be judged, Popper maintains, by whether it proves fruitful in furthering the aims of discovering new ideas and new problems.

Part II of *The Logic of Scientific Discovery* consists of chapters on theories, falsifiability, the empirical basis, testability, simplicity, probability, quantum theory and corroboration. Each is an expansion, development and defence of the ideas briefly stated in Part I and parries a particular cluster of critical objections. The chapters on probability and corroboration, for example, deal at length with the objections that the pervasive probability statements of modern science are not falsifiable, and that they measure the strength of our inductive evidence. The chapters endeavour to show how probability statements can be falsified in relevant ways, and how they are better interpreted as statements of frequencies rather than as measures of inductive support.

3 Later ideas

The English translation of *The Logic of Scientific Discovery* is palimpsestic: while translating it Popper intercalated comments, glosses, developments and corrections in new footnotes and appendices, as well as drafting a supplementary work, the three-volume *Postscript* of 1982-3. Opinion differs over whether all this is fully consistent. A case in point is ‘The Aim of Science’ section of the *Postscript*, published already in 1957, which argues that science aims at satisfactory explanations. It centres around a historical example (Galileo, Kepler, Newton), showing how each theory superseded and explained its predecessor. Satisfactory explanation, in addition to being testable, must fulfil other conditions, making it a rather stronger aim than falsifiability, one that may or may not be the same as the aim of science articulated at the end of *The Logic of Scientific Discovery*, of discovering ‘new, deeper and more general problems’.

Certainly Popper acknowledges some changes of view. Since metaphysical dispute surrounded the concept of truth, he carefully avoided using it in *The Logic of Scientific Discovery*, making do with logical relations (implication, tautology, contradiction). Later, convinced by Tarski’s work, he made free use of the concept of truth and of getting nearer to the truth (verisimilitude). Again, his criticisms of conventionalism in *The Logic of Scientific Discovery* were methodological. In later years they were also openly metaphysical, as Popper espoused a robust realism and indeterminism (1982b, 1983b).

Throughout *The Logic of Scientific Discovery* there are Darwinian metaphors - the struggle for survival among theoretical systems, natural selection, fitness to survive - although, in the last pages of the book, the view that science is an instrument of biological adaptation is rejected. This Darwinian leitmotif became a controversial issue in Popper’s later work: did evolutionary biology yield to the same methodological analysis as physics? Were the central ideas of Darwin or of the modern synthesis falsifiable? To complicate matters, Popper changed his mind on this central question, viewing Darwinism as a historical hypothesis in *Objective Knowledge*, and as an unfalsifiable near tautology in *Unended Quest*. In contrast to his earlier view, Popper also began to advocate an evolutionary epistemology, that is, an attempt to explain the very existence of a truth-seeking science within the framework of natural selection, in effect to give a biological twist to Kant’s problem, ‘How is knowledge possible?’ His second Herbert Spencer Lecture (1975) treats both endosomatic and exosomatic adaptations as forms of knowledge. Biological considerations also weigh heavily in Popper’s part of *The Self and Its Brain*. Pitting himself against the reductionist materialism of most contemporary mind-body specialists, Popper there marshalled mainly indirect arguments for an interactive pluralism.

Reflections on biology seem to have been behind a bold new metaphysical initiative of 1967-8, especially the provocatively entitled ‘Epistemology Without a Knowing Subject’ (1972: ch. 3). Distinguishing the world of physical things from the world of mental things, Popper argued that objective knowledge is located in neither, but in ‘World 3’ - the world of humanly created objective contents of thought. Such intellectual products have an objective existence: theories, problems, problem-situations, theoretical situations and critical arguments have properties and logical interrelations that lack physical or mental analogues. Stored knowledge exists even if no living person retrieves it. Critics of World 3 find some of its consequences counterintuitive: for example, it contains not only all truths, but also all falsehoods, which thus have an equally objective ‘existence’.

In the late 1940s Popper published a particularly forceful and elegant system of natural deduction that is of

considerable interest, both intrinsically and because in it he views deductive logic as the *organon* of criticism (1947a, 1947b). He reports that while he has repaired some defects in it, he never brought it to completion. His technical attentions became focused on the theory of probability, to which he had already contributed in *The Logic of Scientific Discovery*. The result was a highly abstract axiomatic system that made no explicit assumptions about any logical relations among the elements on which probability is defined, and thereby established that probability is a genuine generalization of deducibility. The system is open to many new interpretations of probability statements. A particularly important one, superseding the frequency interpretation of *The Logic of Scientific Discovery*, views probabilities as measures of the 'propensities' of states of the world to develop one way rather than another. In the *Postscript* (1982a) and *A World of Propensities*, this view was developed into a striking new metaphysics (see Probability, interpretations of §4).

4 Democracy, society and individualism

In *Unended Quest*, Popper recounts how, as a politically conscious adolescent, he flirted with Communism. He was quickly disillusioned when he judged Communist actions irresponsible in leading to the deaths of some demonstrators. (Individual autonomy, responsibility, Socratic fallibilism and the obligation to reduce suffering are the keynotes of his scattered remarks about ethics.) In the 1920s he began a critique of Marx and Marxism, first tried out in a talk of 1935, 'The Poverty of Historicism'. 'Historicism' is Popper's name for the idea that there are inexorable laws of historical development: the demand that if natural science can predict eclipses then social science ought to be able to predict political revolutions. In a highly systematic way, Popper set out to show how both those who think the social sciences are not at all like the natural sciences (the 'anti-naturalists') and those who think the social sciences very like the natural sciences (the 'naturalists'), share the aim of predicting history. Both recommend the methodology of historicism, which he sees as impoverished and inclined to treat societies as wholes responding to the pressures of inchoate social forces (see Historicism).

Instead, Popper recommends 'methodological individualism': rules to the effect that the behaviour and actions of collectives should be explained by the behaviour of human individuals acting appropriately to the logic of their social situation as best they can and as best they see it. Not only was the alternative unfruitful, he argued, but the best social explanations of Plato and Marx were individualist. What look like holistic phenomena are to be explained as the 'unintended consequences' of such individual actions reverberating through the social set-up (see Holism and individualism in history and social science §1).

According to methodological individualism, social theories are tested not by historical predictions, which are little more than prophecies, Popper argues, but by attempts to invent institutions that correct social faults by social engineering. Man-made social institutions are hypotheses in action, he says. If we are to refute these hypotheses we need to avoid complicating matters with large-scale experiments, or too many at once, otherwise assessment will be impossible. For we must also reckon with the interference factor of 'the Oedipus effect', that is, the way in which a prediction about the future becomes an altering factor in the situation as human beings are aware of it, thus 'interfering' with the outcome.

The Open Society and Its Enemies was a 'truly unintended consequence' of an attempt to expand aspects of *The Poverty of Historicism* to satisfy puzzled friends. When it grew too large, Popper made it a separate work. On publication in 1945 it elevated him from academic obscurity to academic fame. He became a controversial and well-known public intellectual.

Described modestly as a 'critical introduction to the philosophy of politics and of history', *The Open Society* had become, in the seven years of its gestation, a major treatise on the intellectual and social ills of the time, offering an explanation of how totalitarianism had gained intellectual respectability and how purging post-war society of it would involve rethinking politics, education and social morality. Its title refers to two ideal-types used throughout. A closed society is one which takes a magical or tabooistic attitude to tradition and custom, which does not differentiate between nature and convention. An open society marks that difference and confronts its members with personal decisions and the opportunity to reflect rationally on them. Heraclitus, Aristotle and Hegel are briefly discussed, but the book's two intellectual anti-heroes are Plato in volume 1 and Marx in volume 2.

The volume entitled 'The Spell of Plato' answers two questions: first, why Plato espoused totalitarian ideas and second, why students of Plato have whitewashed that fact and beautified him. The answer to the first question, a

deeply sympathetic piece of writing, sketches a portrait of the young Plato contemplating with dismay the closed world of tribal Athens giving way to a more liberal and open society, with loss of social privilege and chaos arriving hand in hand. Popper insists on the brilliance of Plato's sociological analysis of the causes of change and of his proposals to arrest it and staunch the deterioration it brings. In answer to the second, Popper courts controversy by suggesting that Plato's intellectual followers, flattered by the role offered them, engaged in a long-running *trahison des clercs* by presenting as liberal and enlightened the doctrine of the philosopher king.

To expose the commitment of Plato and Platonists to totalitarianism, Popper had to clarify our ideals of a liberal and democratic social order and show how Plato indulges in persuasive definitions, while attempting to show that his totalitarian *Republic* is 'just'. (Popper also mounts a general attack on the idea that philosophy should seek out the essence of universal words such as justice, democracy and tyranny. He argues that natural science uses the methodology of nominalism, not of essentialism, and social science and philosophy would do well to follow suit.) Mindful of Plato's distaste for majority rule, as rule of the mob or rule of the worst, Popper carefully discusses tyranny, and concludes that the problem is not the question of what is popular, for certain kinds of tyrants are very popular and could easily be elected. So an open and liberal society is not to be identified with a popularly elected government. No more is it a matter of what is just, good or best, for none of these offers insurance against tyranny in their name. In line with his theory of science, and of knowledge generally, he proposes a *via negativa*. The issue is not what regime we want, but what to do about ones we do not want. The problem with tyranny is that the citizens have no peaceful way in which to rid themselves of it, should they want to. Popper proposes a now famous and generally endorsed criterion for democracy as that political system which permits the citizens to rid themselves of an unwanted government without the need to resort to violence. He exposes Plato's question, 'Who should rule?', and all similar discussions of sovereignty as subject to paradoxes because the question permits an inconsistency to develop between the statement designating the ruler (for example, the best or wisest should rule) and what the ruler commands (for example, the best or wisest may then tell us: obey the majority, or the powerful). Popper noticed that the question carries the authoritarian implication that whoever is so named is *entitled* to rule. He replaces them with the practical question 'how can we rid ourselves of bad governments without violence?', with its implication that rulers are on permanent parole. Popper's is a fundamentally pessimistic view that all governments are to one extent or the other incompetent and potentially criminal in their misbehaviour, and that only a political system which allows them to govern at the sufferance of citizens who can withdraw their support readily is one with more or less effective checks against abuse. Even so, the fallibility of our institutional hypotheses enjoin upon us an eternal vigilance.

The second volume, 'The High Tide of Prophecy, Hegel and Marx', argues that the prophetic tendency in Heraclitus and Plato produced in Hegel a damaging incoherence and charlatanry, and in Marx a project for the scientific study of society that, despite noble emancipating aims, foundered, especially among the followers, on the confusion of prediction with unscientific historical prophecy and hence on a fundamental misconstruction of scientific method. The chapters on Marx are among the most penetrating commentaries ever written on him, and are both sympathetic in their appreciation and unremitting in their criticism. Although Popper clearly regards Plato as the deeper thinker, he argues that Marx has much to teach us about how moral and emancipatory impulses can go awry. Marxists and the radical experimenters of the Soviet Union are judged harshly, as are all forms of nationalism.

Appearing in 1945 just after the end of the war, a war that had forged an alliance with the Soviet Union, the book antagonized many powerful intellectual interest groups. Platonists were taken aback to be accused of being apologists for totalitarian tendencies in Plato (even though Popper was not the first to point these out) and Marxists were equally affronted. The aftermath was strange. Although Popper was at first widely read and indignantly denounced, it later became bad form among Marxists and classicists to mention him by name. Yet, to an extraordinary extent, in the following decades his work set the agenda for apologetic Platonists, Hegelians and Marxists. In many cases a book or article makes most sense when seen as covertly engaged in trying to confute some point Popper made in *The Open Society*.

As a teacher of philosophy, Popper displayed ambivalence: philosophical problems emerge from science (1962: ch. 2), so the best preparation was an education in a first-order subject, preferably scientific. In the classroom, he had the charisma of one possessed by intellectual problems, thinking about them all the time. In lecture or seminar he could be intellectually fierce and confrontational, in personal encounter sweet and encouraging. He regularly

displayed an astonishingly quick intuitive grasp of the logic of any position presented to him, even from the most meagre of clues, and an eagerness to strengthen and elaborate on it before setting about criticizing it. He thus exemplified the values he advocated: intellectual seriousness, personal responsibility and disinterestedness, that is, doing justice to ideas regardless of their temporary embodiment. The failure of much critical commentary to meet these standards lies behind his complaint of misrepresentation. But there are also other reasons. If Popper is correct, not only is much in the traditional way of doing philosophy misdirected, but even the questions are wrongly put. Any attempt to map Popper's ideas into traditionally oriented discussions risks misrepresentation. The frequent practice of reconstructing Popper's philosophy timelessly, plucking materials from works published as far apart as fifty years, flies in the face of his emphasis on the structuring role of problems and problem-situations in all intellectual activity, particularly inquiry. To do justice to the originality and creativity of his work, scholarship needs in the first instance to respect its intellectual context of production.

List of works

Popper, K.R. (1935) *Logik der Forschung (The Logic of Research)*, Vienna: Springer; trans. *The Logic of Scientific Discovery*, London: Hutchinson, 1959.(Crisp and incisive statement of his classic ideas on philosophy of science and of epistemology. The English translation contains additional material, as explained in §3.)

Popper, K.R. (1945) *The Open Society and Its Enemies*, London: Routledge.(A critical introduction to the philosophy of history and of politics that takes Plato, Hegel and Marx to task for their anti-democratic and anti-critical tendencies.)

Popper, K.R. (1947a) 'New Foundations for Logic', *Mind* 56: 193-235, with corrections in (1948) 57: 69-70.(A system of natural deduction.)

Popper, K.R. (1947b) 'Logic Without Assumptions', *Proceedings of the Aristotelian Society*, 48: 251-92. (Investigates the notion of deducibility and the foundations of logic in language.)

Popper, K.R. (1957) *The Poverty of Historicism*, London: Routledge.(States and rebuts the arguments for belief in inexorable laws of human destiny.)

Popper, K.R. (1962) *Conjectures and Refutations*, London: Routledge.(A wide-ranging collection of essays from the period 1940-62, including several that have become classics.)

Popper, K.R. (1972) *Objective Knowledge*, Oxford: Clarendon Press.(A collection of essays from 1948-72, many being extensions of and alterations to his original philosophy of science and epistemology.)

Popper, K.R. (1975) 'The Rationality of Scientific Revolutions', in R. Harré (ed.) *Problems of Scientific Revolutions*, Oxford: Clarendon Press, 72-101.(Popper's answer to Kuhn's irrationalist view of scientific revolutions.)

Popper, K.R. (1976) *Unended Quest*, London: Fontana.(Intellectual autobiography; approachable and written with considerable verve.)

Popper, K.R. and Eccles, J.C. (1977) *The Self and Its Brain*, Berlin: Springer.(Joins a fellow Nobelist in proposing an evolutionist and interactionist model of the mind-body problem.)

Popper, K.R. (1979) *Die Beiden Grundprobleme der Erkenntnistheorie (The Two Basic Problems of the Theory of Knowledge)*, Tübingen: Mohr.(All that survives of the book Popper was working on when he turned instead to *The Logic of Scientific Discovery*.)

Popper, K.R. (1982a) *Quantum Theory and the Schism in Physics*, London: Hutchinson. (Reflections on problems of the interpretation of quantum mechanics; part II of the *Postscript*.)

Popper, K.R. (1982b) *The Open Universe*, London: Hutchinson.(Statement of Popper's metaphysical indeterminism; part III of the *Postscript*.)

Popper, K.R. (1983a) *Realism and the Aim of Science*, London: Hutchinson.(Long commentary on many of the issues originally discussed in *The Logic of Scientific Discovery* and their reception; part I of the *Postscript*.)

Popper, K.R. and Miller, D. (1983b) 'A Proof of the Impossibility of Inductive Probability', *Nature* 302: 687-8. (Proof that evidence, far from supporting a hypothesis, undermines the statement of the evidence and hence the hypothesis itself.)

Popper, K.R. (1987) 'Why Probabilistic Support is Not Inductive', *Philosophical Transactions of the Royal*

Society of London, A321: 569-91.(Restatement and elaboration of Popper and Miller (1983).)
Popper, K.R. (1990) *A World of Propensities*, Bristol: Thoemmes.(The propensity interpretation of probability statements developed as a full-blown metaphysics.)
Popper, K.R. (1992) *In Search of a Better World*, London: Routledge.(Speeches and address to general audiences.)
Popper, K.R. (1994a) *Knowledge and the Body-Mind Problem*, London: Routledge.(Essays from his last thirty years on the mind-body problem and other matters.)
Popper, K.R. (1994b) *The Myth of the Framework*, London: Routledge.(Essays from his last thirty years on the philosophy of physical and social science.)
Schilpp, P.A. (ed.) (1974) *The Philosophy of Karl Popper*, La Salle, IL: Open Court. (Two volumes, containing Popper's intellectual autobiography, 33 critical essays and 'Replies to My Critics', as well as a complete bibliography up 1973.)
Adorno, T.W. *et al*. (1976) *The Positivist Dispute in German Sociology*, London: Heinemann.(Contains Popper's 'The Logic of the Social Sciences' and 'Revolution or Reform?'.)

Population and ethics

Ethical concern with population policies and with the issue of optimal population size is, generally speaking, a modern phenomenon. Although the first divine injunction of the Bible is 'be fertile and multiply', systematic theoretical interest in the normative aspects of demography has become associated largely with recent developments which have provided humanity with unprecedented control over population size, mainly through medical and economic means. Once the determination of the number of people in the world is no longer a natural given fact, but rather a matter of individual or social choice, it becomes subject to moral evaluation.

However, the extension of traditional ethical principles to issues of population policies is bedevilled by paradoxes. The principle of utility, the ideal of self-perfection, the idea of a contract as a basis for political legitimacy and social justice, the notion of natural or human rights, and the principle of respect for persons - all these presuppose the existence of human beings whose interests, welfare, rights and dignity are to be protected and promoted. But population policies deal with the creation of people and the decision concerning their number. They relate to the creation of the very conditions for the application of ethical principles.

1 'The population bomb'

The number of people now living is larger than the number who have ever lived in all past generations of humanity taken together. This striking fact of absolute numbers stands alongside a rate of growth which now doubles the population of the world every thirty-five years. Sharp awareness of the threat that these facts and trends present goes back to the early nineteenth century, primarily to the work of Thomas Malthus, who argued that the number of people multiplies in geometric progression while the resources which support their life can be expected to grow at most in arithmetic progression. The threat of overpopulation arising from this gap in rates of growth can be checked either by factors like death from starvation, illness and war, or by preventive measures such as controlling the number of births. Following Malthus, it is commonly believed that there is an ethical asymmetry between the two kinds of checks: the premature death of living people is morally worse than the non-creation of new people. Thus, a rise in life expectancy is generally considered a blessing, while an increase in births is treated as a menace. However, balancing world population is particularly problematic, since overpopulation is primarily due to the decrease in death rates rather than the increase in birth rates. Consequently, even if very restrictive population policies were implemented (such as zero population growth), many decades would pass before the number of births and the number of deaths balanced one other.

Concern with the danger of overpopulation is historically and analytically associated with two major normative issues, themselves interdependent: the just distribution of welfare across generations (usually referred to as the problem of savings); and responsibility for the environment (conservation). Thus, since the 1920s economists have attempted to fix optimum population size in economic terms, such as the highest income per capita across generations, and theories of justice (particularly since Rawls) have tackled the population question through the principles of justice applied intergenerationally (see Future generations, obligations to; Justice). Meanwhile, environmentalists have argued over the last few decades that the number of people in the world should be limited in terms of the carrying capacity of the planet and respect for the integrity of the natural environment, either for the sake of future people ('shallow ecology') or for its own sake ('deep ecology') (see Environmental ethics). However, one can take the opposite approach and rather than subordinate the issue of population to economic or ecological considerations, treat the existence and number of people as the foundation for both economic justice and environmental policies. Thus, for instance, one may take the existence of a growing population as a *given* fact which should dictate a new approach to the natural environment in which the wilderness will have a radically weakened status.

The metaphors of 'the population bomb' and 'population explosion' typically convey a morally negative evaluation of the increase in the number of human beings. However, beyond the empirical debate between the 'alarmist', neo-Malthusian view and its opponents who see no danger in population growth as such, a critical philosophical analysis of the issue raises the following questions. Is the size of world population an ethical issue at all? If it is, what are the normative criteria for determining the 'right' (or optimal) size? If such criteria can be formulated and justified, what are the ethical constraints in implementing suitable policies for the attainment of

this size?

2 Optimum population size

The question of optimal population size touches upon the deepest problems concerning the nature of value: is value ascribed impersonally to 'the world', or only to actual human beings whose very existence is presupposed by any evaluation? The first view (impersonalism) treats the population issue as a function of a value or an end considered in abstraction. The ideal number of people is that which would promote that end to the maximal degree. This could be average or total utility, the foundation of a Kantian 'kingdom of ends', or the establishment of a Marxian classless society. The second view (commonly called 'person-affecting') holds that moral evaluation applies only to existing human beings and hence cannot serve to assess the value of any particular number of human beings, indeed not even of the very existence of humanity. According to this view, 'good' is always 'good *for*', and consequently one cannot say that to be born (or not to be born) is a morally good (or bad) thing. Increasing or reducing the number of future people cannot in the person-affecting view be considered morally desirable (or obligatory) since the interests of no particular people are promoted or rights of particular persons respected either by bringing them into the world or by preventing them from coming into existence.

The two views face difficult problems, which have been extensively discussed by Derek Parfit (1984). Take first utilitarianism, which has been the most popular version of impersonalism in the context of population questions (see Utilitarianism). Total utilitarianism leads to the so-called 'repugnant conclusion', according to which the world would be overcrowded with people whose extremely low quality of life is offset by their huge number, thus achieving the highest value of total utility. Average utility fares no better, since it recommends a policy which on the one hand would make it obligatory to bring a new child into the world whose happiness would be a little above the current average, and on the other hand would prohibit the addition of extra people whose standard of living would be even slightly below that enjoyed by present people. Negative utilitarianism, which aims at the overall reduction of pain rather than the promotion of happiness, could lead to the absurd ideal of total abstention from procreation.

Turning from these impersonal criteria to the person-affecting view, we are confronted by the problem of identity. We cannot say that population policies serve the interests or the welfare of future people since they themselves directly and indirectly affect the identity of those people. Thus, if we decide on a restrictive population policy, for example, by introducing family planning programmes, the people who are actually going to be born are not the same as those who would have been born had we abstained from interfering in people's reproductive choices. The idea of an optimal population size is therefore logically incoherent. On the one hand, there is the indeterminacy of an ideal based on the combination of two variables; namely, 'maximum happiness to maximum people', which has been shown traditionally to have no unique 'solution', as it can be achieved equally by raising the amount of happiness or by raising the number of people. On the other hand, there is the incommensurability of the respective value of two populations consisting of different individuals; namely, the problem of identity, in which case the person-affecting view makes it impossible to compare the value of the lives of alternative sets of people.

Other philosophers have noted the special difficulties incurred in applying contract theory to the issue of population. These derive from the problem of representation in Rawls' 'original position': who takes part in the initial contract? All possible people (but can these be even theoretically identified)? All actual people (but their number is exactly the issue to be decided by the contract)? Representatives of each generation, or rather a representative of one particular generation, who does not know which generation it is? Contractors negotiating their coming into being, their very existence, is an idea which leads to interesting paradoxes that have been discussed primarily by John Rawls (1971) and his critics (see Contractarianism §7).

Our intuitions concerning optimal population size are also indeterminate. Beyond some clear upper and lower limits of over- and underpopulation, we do not have any firm beliefs as to the right balance between the quantity and quality of human lives. Furthermore, our preferences concerning numbers are typically 'adaptive', that is to say they are themselves formed and affected by the size of population to which we belong. We thus tend to project our own preferences on our descendants, assuming (without justification) that they would not want to live in a more crowded environment than we did. From this welfarist perspective, optimal population size is a myth and the population issue lies in principle beyond the scope of ethics. Yet, we can be sure that future generations are going to have some basic needs and wants which will be hard to fulfil if the rate of population growth remains

unchecked. This in most views provides a moral justification for control measures.

3 Means of implementation

Even if there are criteria for fixing a desired population size, all philosophers agree that there are constraints on their implementation. One fundamental problem belongs to distributive justice: how should the burden of achieving the demographic goal be distributed, both within the present generation and between generations? Unlike the abstract issue of optimal population size, which deals with future (possible) people, the implementation of population policies affects actual people and their interests. Thus, for instance, should the burden of curtailing growth fall on all classes equally (as in China where each family is allowed to have no more than one child) or proportionally to the actual (or desired) number of children in a family? Should poor families be compensated when reproductive restraint means that they have fewer working members (an acute problem in the Third World)? Should religious beliefs play a role in deciding differential criteria in the distribution of the burden of birth control? Furthermore, may rich nations make economic aid conditional upon the adoption of family planning programmes? These questions of distributive justice can be tackled in terms of the various theories of justice. But when raised on the intergenerational level they become elusive. The goal of a certain population size can be achieved either by an aggressive policy within, for example, two generations or by a milder one within four. The problem is that full equality in distribution of the burden would require a spread over an indefinite number of generations, which is absurd.

Population policies usually involve a gap between private rights and public interest, and hence require politically enforced coordination (so as to avoid free riders). This is Garrett Hardin’s view of the *Tragedy of the Commons* (1968), in which overgrazing can be prevented (for the benefit of everybody) only by state interference. But procreation is usually considered a private matter in which the law should not interfere. Positive means, like enforcing sterilization or legally limiting the number of children, are usually considered immoral. But indirect incentives (positive or negative) through taxation, free birth control or education are acceptable. There is also wide agreement today that a rise in the standard of living, as well as an improvement in the status of women in society and in the family, are both desirable goals in themselves and effective means of restraining population growth.

Pornography

There are three main questions about pornography. (1) How is pornography to be defined? Some definitions include the contention that it is morally wrong, while others define it neutrally in terms of its content and function. (2) Why is it wrong? Some accounts see the moral wrong of pornography in its tendency to corrupt individuals or to have detrimental effects on the morality of society; other accounts declare pornography to be objectionable only in so far as it causes physical harm to those involved in its production, or offence to unwilling observers. (3) Should pornography be restricted by law? Controversy here centres around whether the law should be used to discourage immorality, and whether the importance of free speech and individual autonomy are such as to rule out legislating against pornography. Here, the pornography debate raises very general questions about law and about autonomy in liberal societies.

1 What is pornography?

The question appears simple, but it admits of many conflicting answers. Etymologically, ‘pornography’ means the depiction of women as prostitutes, and although this may now appear an inappropriate definition, some feminists have appealed to it as part of an argument for the legal restriction of pornography. Thus Andrea Dworkin and Catharine MacKinnon (1988) have proposed that pornography be defined as ‘the graphic, sexually explicit subordination of women whether in pictures or in words’, and they go on to include within the definition representations in which women are presented dehumanized as sexual objects or commodities, or as whores by nature, or as experiencing sexual pleasure in being raped. The definition is contentious for a number of reasons. First, it seems unduly restrictive, since it excludes, for example, gay pornography and child pornography. Moreover, the definition is value-laden. In declaring that pornography definitionally involves the subordination of women, Dworkin and MacKinnon assume that it is morally wrong but this needs to be shown, not simply stated. For these reasons, some writers have proposed a ‘neutral’ definition of pornography, which aims to identify pornographic material by reference to its degree of sexual explicitness and to leave open the question whether such explicitness is morally objectionable or an appropriate object of legal restriction.

An example of this second approach is the 1979 *Report of the Committee on Obscenity and Film Censorship in England and Wales* (‘The Williams Report’). The Report uses the term ‘pornography’ to refer to ‘a book, verse, painting, photograph, film, or some such thing - what may in general be called a *representation*’, and proposes that ‘a pornographic representation is one that combines two features: it has a certain function or intention, to arouse its audience sexually, and also a certain content, explicit representations of sexual material (organs, postures, activity etc.). A work has to have both this function and this content to be a piece of pornography’ (8.2). This definition simply refers to the function and content of representations and leaves questions of morality and of legal restriction to be addressed separately.

However, this definition has also been criticized on the grounds that it does not accurately reflect current usage. Thus, the 1986 Meese Commission in the United States declared that ‘the appellation "pornography" is undoubtedly pejorative’, and objected to the Williams definition because it did not reflect this fact. Similarly the US Johnson Commission (1970) declined to use the term at all in its legal recommendations, arguing that it appeared to have ‘no legal significance and most often denoted subjective disapproval of material rather than its content or effect’.

There is, therefore, considerable controversy surrounding the definition of pornography: in ordinary usage it appears to be a pejorative term, which expresses subjective disapproval of sexually explicit material; but it is argued that to be useful in a legal context it must go beyond the merely subjective and make reference to content and function in a way which is, as far as possible, morally neutral.

2 What is wrong with pornography?

There is also considerable dispute about whether and why pornography is morally wrong, and about whether the nature of any wrongness is sufficient to justify legal restriction or prohibition. Some argue that pornography corrupts those who consume it. Indeed this claim is built into the current British law governing obscenity, which defines material as ‘obscene’ when it has a ‘tendency to deprave and corrupt’ those who are likely to read, see or

hear it. A similar understanding of the wrong of pornography is implicit in the Dworkin-MacKinnon Ordinance, which construes pornography as a purveyor of sexist images of women and a corrupting influence on society. For them, pornography acts as a kind of moral poison in the societal water supply, and can serve to legitimize contemptuous attitudes towards women, and possibly even sexual violence against them.

In both cases the charge against obscene material generally, and pornographic material in particular, is that it is morally damaging, either to the individuals who consume it or to society in general.

Others, however, eschew reference to moral harm, either because they are sceptical about the very notion, or because they feel that it should not be appealed to in a legal context. Thus, the Williams Report deems pornography to be wrong only in so far as its production involves the infliction of physical harm, or if it causes offence to unwitting and unwilling observers. Moral wrongness is not, in itself, any part of the case against pornography. Indeed, as was noted above, the Williams Report defines pornography simply in terms of sexual explicitness and makes no reference to its moral status.

3 What justifies legislating against pornography?

Not surprisingly, the different definitions of pornography, coupled with different accounts of why it may be objectionable, yield different proposals for legal action. Those who believe that pornography may be restricted because it is morally damaging, either to the consumer or to society more generally, are often accused of paternalism (see Paternalism). This is a serious charge because an important guiding principle of liberal democratic societies is that the state should be neutral between competing conceptions of the good. It should not attempt to impose on its citizens any particular, favoured understanding of the best way to live, nor should it prohibit or discourage actions simply on the grounds that they are believed to be morally undesirable (see Liberalism).

Connectedly, the principle of free speech is a very important one in liberal societies, and some have argued that restricting or suppressing pornography offends against that principle (see Freedom of speech). The importance of free speech is often explained by reference to individual autonomy: people can best become autonomous in societies where they are able to develop their own views and opinions, and that requires that they have access to a wide range of opinions and beliefs from which they themselves may choose (see Autonomy, ethical).

However, both the argument from neutrality and the argument from free speech have been questioned, most notably by feminists who claim that the free availability of pornography is itself something which undermines the neutrality of the state and denies freedom of speech to certain groups. Thus, it has been suggested that pornography is akin to racist speech: just as racist speech may undermine the self-respect of black people or minority groups, so pornography undermines the self-respect of women and makes it difficult for them to develop autonomy.

This feminist critique of pornography also questions the individualist assumptions of liberal political philosophy. On this understanding, the justification for legislating against pornography is not the moral harm or offence which it causes to specific individuals, but rather the damage which is done to the self-esteem of women as a group.

Porphyry (*c*.233-309 AD)

The late ancient philosopher Porphyry was one of the founders of Neoplatonism. He edited the teachings of Plotinus into the form in which they are now known, clarified them with insights of his own and established them in the thought of his time. But, in reaction to Plotinus, he also advanced the cause of Aristotle's philosophical logic. Indeed, Porphyry is responsible for the resurgence of interest in Aristotle, which continued to the Middle Ages and beyond. Because of Porphyry, later Greek philosophy recovered both its Platonic and its Aristotelian roots, and Neoplatonism aimed to combine inspired thought with academic precision.

He was a scholar of great learning, with interests ranging from literary criticism and history to religion. An example is his defence of vegetarianism, which anticipated the modern debate on ecological preservation. Humans and animals belong to the same family. Seeking to preserve life is a matter of extending philanthropy and respect to all living species, which are our natural siblings. Ideally we ought to display 'harmlessness' even towards plants, except that our bodies, being composite and mortal, need to consume something else for food. Thus we should be ever conscious of the destructive effect that our eating habits and consumerism have on the creation of which we are part, and should try to keep to a simple lifestyle.

Porphyry's attention to logic, metaphysics and all other topics was driven by his firm belief that reason exercised by pure mind leads to the true essence of things, the One God. Intellectual activity detaches the soul from passions and confusions, and concentrates its activity on the real things. Porphyry attacked Christianity and Gnosticism because he thought they appealed to the irrational. Mysteries and rituals are fitted for those who are unable to practise inward contemplation. Salvation comes to those leading the life of the philosopher-priest.

1 Life and philosophical conflicts

Porphyry was born in the ancient Phoenician port of Tyre. His parents were Syrian and he was originally named after his father Malkhos ('king'). He spent many years expanding his general knowledge, and learning the languages (including Hebrew) and religions of the eastern Roman Empire. He then travelled to Athens, one of the two main centres of teaching in the Empire, and became a mature student of the eminent scholar Longinus. According to the vivid descriptions typical of the age, Longinus was a 'living library and walking museum' and the academic's critical attention to detail, clarity of style and erudition left their permanent mark on the keen student. Longinus renamed him 'Porphyry', which in Greek means 'purple', the royal dye for which Tyre was famous.

At the age of thirty, Porphyry went to join Plotinus in Rome. His first impression of him was ambivalent: Plotinus was original but could not express himself clearly - 'The seminars were like conversations' and 'The logical coherence of the argument was not made obvious'. Longinus disagreed with Plotinus over the contents of reality, the Platonic Forms. Longinus considered them distinct from the thoughts about them. Plotinus taught that they are identical with thoughts in God's intellect. 'On the third try' Porphyry came to 'understand with difficulty' Plotinus' position, was persuaded and 'tried to rouse in the master the ambition to organize his doctrines' (*Life of Plotinus* 18).

Five years later Porphyry moved away from Rome to Sicily. His own retrospective explanation was that he suffered from depression to the point of contemplating suicide. Recent studies, however, have linked his decision to crises in Plotinus' circle. On the one side, Plotinus' closest spokesman, Amelius, turned increasingly to theurgy as the means to enlightenment, and moved away to Apamea (Syria) (see Iamblichus). On the other, Porphyry disagreed with Plotinus' denigration of Aristotle, especially of his categories of being. Porphyry had concluded that the chief enemy was the irrational appeal of Gnosticism and Christianity (see Gnosticism). Hellenic philosophies had to close ranks. During his stay in Sicily Porphyry composed a treatise on the 'harmony of Aristotle and Plato' and wrote the key works that marked the revival of Aristotelian studies. He wrote them in a teachable form, especially the *Introduction* (*Isagōgē*) to logic and a commentary *On Aristotle's Categories* in user-friendly question and answer format. He also wrote the unique philosophical study of vegetarianism, *On Abstinence from Animal Food* (it includes an invaluable history of arguments for and against). Equipped with his knowledge of textual criticism and languages, he published a critical appraisal of Christian doctrines and the Bible (not superseded until modern times), and proved a Zoroastrian book a forgery. Most importantly he kept in touch

with Plotinus, who entrusted him with revising his teachings.

Porphyry returned to Rome much later (in the early 280s) - well after Plotinus' solitary death in AD 270 from leprosy. In this period he married, continued his sojourns, wrote commentaries on Plato and treatises on ethical, philological and historical topics, and added to his already considerable reputation as the most lucid and learned scholar. Clarity and concision are indeed Porphyry's traits. He attracted the interest of Iamblichus, who may have visited him. However, he soon disagreed vigorously with Iamblichus' fondness for the supra-rational and they parted company in the 290s. By AD 301 or 305 Porphyry had completed the grand task of editing and publishing Plotinus' teachings in the form in which they are now known - the six *Enneads*. These he prefaced, in the conventional scholastic manner, with the master's biography. Interestingly, Plotinus is presented as the paragon of the true philosopher, who reaches enlightenment through contemplation, not through theurgy, in contrast to Iamblichus. During this latter period Porphyry was invited to the court of the eastern Roman emperor, but may have returned to Rome where he died.

2 Language and metaphysics

For Porphyry, Aristotle and Plato agree once their domains are demarcated. How are they in 'harmony'? Porphyry's treatise on this is lost but we can extrapolate from other works and fragments, mainly those on Aristotle's logic. First, Porphyry disagreed with Plotinus over the fundamental divisions of things, the categories (see Aristotle §7; Categories §1). What do we categorize? Our ways of talking (words)? Our ways of thinking (concepts)? Things that exist (beings)? Furthermore, when we form statements and propositions, are the predicates we use, linguistic expressions, concepts, classes, or realities? As Porphyry tells us in the commentary *On Aristotle's Categories*, the Stoics, several Middle Platonists and Plotinus (politely left unnamed in Porphyry's attack) took Aristotle's theory of categories to be about real beings, and rejected it. Platonists could never accept that only individual, material things constitute the ultimate substance. The Platonic separable Forms are the 'truly real', and as Plotinus asserted the true categories should follow from the 'five most general kinds' in Plato's *Sophist* (see Plotinus §4). Porphyry, in contrast, saw an inherent validity in Aristotle's analysis. The categories are indeed valid when limited to the fields of logic and semantics. We base our accounts and phrases on individual concrete 'substances': for example, this or that human, animal, house; we talk of physical qualities, places, and so on. Abstracted universals are constructs of personal minds, but are not real universals, the Forms. Thus, Aristotle's categories do not impinge on what may or not be independently real. In our ordinary experience we live in a world of 'signifying sounds' (*sēmantikai phōnai*). These enable us to communicate the concepts we acquire about the objects we sense. The fundamental divisions of our immediate common experience refer to 'expressions signifying objects' (*On Aristotle's Categories* 58.3-6).

Second, how well we communicate depends on how precise our definitions are. In the *Introduction* to Aristotle's logic (in the *Categories* and *Topics*), Porphyry argued that only five 'signifying terms' cover the range of predicates we use: genus (general type), species (specific), difference (what distinguishes a family of species from the rest within a genus), property (what is characteristic of a species) and accident. Things are thus defined by their 'properties in the strict sense' (*kyriōs idia*): for example, a horse is what neighs, and conversely, what neighs is a horse. Indeed, a thing is a 'bundle' (*athroismos*) of properties (compare Russell, B.A.W. §12). Porphyry made the scheme amenable to Platonists by interpreting difference and property (also genus and species) as potentialities for fulfilment, not actualities. Defining a human as a laughing animal refers only to the capacity, which is always present, not the act of laughing itself. This makes it possible to admit degrees of fulfilment: the 'more or less' approximation to the archetypal form.

Third, Porphyry supported the distinction between immanent and transcendent universals. This we see earlier in the Middle Platonist Alcinous. Universals in concrete things correspond to the forms as Aristotle saw them, that is, as compounds with matter. Universals that are separable from material manifestation correspond to the Platonic Forms (see Platonism, Early and Middle §4).

Fourth, Porphyry seems to have interpreted a key passage in Aristotle's *Metaphysics* (XII) in a way that supported the Neoplatonic One as the foundation of all existence (see Plotinus §3). Since Porphyry's commentary on the *Metaphysics* is lost, evidence may be reconstituted from references to him in a commentary on the *Categories* by Dexippus, a student of Iamblichus (see Hadot 1974). For Aristotle, the study of physical substances presupposes a pure, intelligible substance. For a Neoplatonist like Porphyry, Aristotle suggests a series of substances, from the

physical to the incorporeal. The latter can be described only by analogy with things perceived by the senses. Furthermore, the intelligible substance gives coherence to the series of substances only because it has itself received unity from a pure One.

The ’harmonization’ through demarcation seems to underlie Porphyry’s extensive discussion of incorporeals and corporeals in his *Sentences Leading to the Intelligibles*. Although it is intended as a concise introduction to Plotinus, it contains fresh ideas anticipating modern distinctions of mind/body. Soul, intellect and the One are classed together as incorporeal. They lack spatial extension, location and volume. Without corporeality, the categories and relations of our ordinary language, big-small, in-out, here-there etc., lose their normal reference. So to locate such incorporeals we resort to paradoxical statements: for example, ’everywhere and nowhere’. Bodies are not ’zoo-cages’ for minds, nor do souls ‘fall down’ to earth. Rather, incorporeal entities exercise their activity in a particular area, according to their ’disposition’. Incorporeals and bodies do not mix but form an asymmetrical ’assimilation’ and ’union’. For Porphyry, this is the reason why our world of experience ’remains much distant’ from reality (*Sentences* 35.30).

From another perspective, the Neoplatonic One emerges as the sole entity to possess its own foundation for existence. Everything else exists in relation to it. This, together with the telescoping of the metaphysical differences between soul and intellect may mean that Porphyry was a monist. On the other hand, in his *Sentences* we see a proliferation of elemental bodies of the soul. The controversial anonymous *Commentary on the Parmenides*, attributed to Porphyry or a follower, reinforces the importance of the One, but also offers first evidence of the threefold structure, being-life-intellect, which will typify the complex metaphysics of Iamblichean Neoplatonism. It may simply be the case that Porphyry contracted or expanded metaphysical layers depending on the distinction he was examining.

Porphyry extended his polymathy to religion. He wrote on daemons and is the first to quote the Chaldaean Oracles. Because these appear to be out of character for someone known for his rationalist attitude, it has been suggested that he was concerned with them in his earlier, pre-philosophical life. However, belief in the existence of such entities was commonplace in all strata of ancient society. What is more pertinent is his evaluation of such things. Judging from his attack on Iamblichus, Porphyry does not dismiss rituals and spirit-work but limits them to a purifying role (see §3). The divine cannot be reached in this way. Philosophical contemplation alone can activate the soul towards intellect and the One God.

3 Ethics

Porphyry treats ethics as applied metaphysics and epistemology. We garner his views from lines in the *Sentences* which refer to virtue, from the *Letter to Marcella* (Porphyry’s wife) and from *On Abstinence*. In all three the goal of moral life is ’becoming like God’. In the first two he establishes that intellectual contemplation is the surest path to God. In the third he fleshes out how a rational, just life preserves things and does no harm to them.

The best example of his ethics is in the opening remarks of his *Letter to Marcella*, where he reminds his wife, ’you should put aside irrational distress, which is an emotion, and not be led by trivial judgments, but remember the divine words by which you were initiated into upright philosophy. For a steadfast attention to these words will habitually prove itself in action. It is deeds that give proof of our doctrines, and we must live by our faith to bear faithful witness to our teachings’ (8.4-8).

The aim of ethics is to show the way of assimilating one’s self to the true being, the Neoplatonic One. Since intellect is the level closest to the divine One, the path to God is philosophical. One must first reach the state of ’impassibility’ (*apatheia*) (see Stoicism §9). The calm, rational mind separates from the passions that try to tear apart the unity of human life (on separation of soul, see Plato §13). A person’s living presence is not the body and therefore cannot be physically located. ‘Surely, you must not think of my self as something that can be touched and be incidental to the senses: my true self is remote from the body, without colour and shape, not to be touched by the hands but grasped only by the mind’ (*Letter to Marcella* 8.11-3).

For Porphyry, true priests are the ’wise’, those philosophers who practise what they teach:

> ‘Whoever practises wisdom practises knowledge of God, not by always praying and sacrificing, but by practising piety in the actions towards God… we must make ourselves pleasing to God, and consecrate our own

> disposition by making it similar to the immortal and blessed nature'. He also states: 'The wise soul joins with God and always beholds God and keeps his company…. It is not the utterance of the wise that is honourable to God, but deeds. A wise person honours God even silent…. The wise person, therefore, alone is a priest, alone is beloved by God, alone knows how to pray'.
>
> (17.1-6, 16.7-17.2)

The philosopher respects all life as expressions of the One true being. Thus the philosopher-priest is a pacifist towards all types of life. There should be no killing, even for food, and certainly no killing of animals. Furthermore, we should regret that we have to eat other life forms, even plants (*On Abstinence* III 27).

Following Plotinus, Porphyry identified four kinds of virtue: civil life, purification, contemplation and exemplary. Each is fit for an appropriate grade of life:

> 'There is a difference between the virtues of the citizen; those of the one who attempts to rise to contemplation, and who, on this account, is said to be contemplative; those of the one who does contemplate perfectly; and finally those of the pure Intelligence, which is completely separated from soul'.
>
> (*Sentences* 32)

Each virtue befits a level of awareness:

> 'The objects (*skopoi*), differ with the kind of virtues. The object of the civil virtues is to moderate our passions to conform withthe activities of human nature. That of the purificatory virtues is to detach the soul completely from the passions. That of the contemplative virtues is to apply the soul to intellectual activities, even to the extent of no longer having to think of the need of freeing oneself from the passions…. The exemplary virtues reside within intelligence'.
>
> (*Sentences* 32)

4 Literary theory

During his time with Longinus, Porphyry developed his skill for literary criticism - 'critic' (*kritikos*) was a title of professional recognition. What is the meaning of a literary account? How are we to understand it? Does it refer to concrete or symbolic events? The last question was the more problematic because it opens wide the field of interpretation and links literature to the representational arts. The question then arises whether the creation of an artist (*poiētēs*) reflects truth or somehow misleads. Put in a Platonic context, do artists (in literature, sculpture, drawing) use artistic images as representations and 'imitations' of intangible truths, or do they exercise their artistic ''licence' (*exousia*) without regard for truth, and so present distortions and falsehoods?

Porphyry showed his 'critical' skill both negatively (to prove that some Gnostic and Christian holy books were recent forgeries) and positively (notably the allegorizing of Homer's *Odyssey* and the Cave of Nymphs). Building on a tradition that can be traced to Numenius (a second-century AD Platonist, who anticipated Plotinus and Iamblichus), Porphyry interpreted the Homeric hero as the human soul. The hero's journey is an allegory for the journey of the soul through life with the attendant travails and terrors: the process of psychological internalization. Poetic descriptions of the lands, dwellings and temples the hero visits, and of the people and wondrous creature he encounters, can be interpreted on many levels according to the Neoplatonic levels of knowledge and being.

Works of literature and art are not just for entertainment or purging the emotions. They may point to truths about knowledge and being, just as language mediates reality. Thus literary theory (and aesthetics) becomes part of the philosopher's purview.

5 Influence

As the editor and publicist of the *Enneads*, Porphyry ensured the dissemination of Plotinian thought. Although he expanded the emerging Neoplatonic metaphysics, in this he remained in his master's shadow. This Plotinian-Porphyrian theological Neoplatonism can be seen in Augustine and his followers in the Latin West.

Porphyry shone independently, however, in his work on Aristotle and logic. He is the pivotal figure among the Aristotle Commentators, rescuing Aristotelian studies from total obscurity and securing their place in

post-Plotinian philosophy. It is this new, broader Neoplatonism we find in Boethius, and it is this which gave rise to medieval scholasticism and so-called Aristotelianism (see Aristotelianism, medieval; Aristotelianism, Renaissance). On the Greek side, both Porphyry and Aristotle became part of the Iamblichean Neoplatonism and were enshrined in the curriculum that lasted for centuries. In the Latin West, we may trace the influence of Porphyry's *Isagōgē* both to autonomous logical theory (see, for example, the work of Shyreswood and William of Ockham), and to the debate on nominalism and realism (see Abelard). We may also profitably reflect on Porphyry's contribution to the problem of sense and reference.

List of works

Porphyry's works may be dated according to very broad eras of interest, the mainly Aristotelian, followed by the Platonic, then finally a work against Iamblichus (*Letter to Anebo*) and an edition of Plotinus' *Enneads*. Twenty or so of his eighty titles survive.

Porphyry (mid 3rd century AD) *Philosophy from the Chaldaean Oracles*, ed. G. Wolff, *De philosophia ex oraculis*, Berlin: Springer, 1856; repr. Hildesheim: Olms, 1962.(Greek text.)

Porphyry (mid 3rd century AD) *On Aristotle's Categories*, trans. S. Strange, London: Duckworth, 1992.(English translation; for Greek text, see *Introduction (Isagōgē)*.)

Porphyry (mid 3rd century AD) *Introduction (Isagōgē)* ed. A. Busse, *Isagoge et in Aristotelis categorias commentarium*, CAG 4.1, Berlin: Reimer, 1887; trans. E. Warren, *Porphyry the Phoenician: Isagōgē*, Toronto, Ont: Pontifical Institute of Medieval Studies, 1975.(English translation.)

Porphyry (mid 3rd century AD) *Cave of the Nymphs in the Odyssey*, Arethusa Monographs 1, ed. L.G. Westerink, Buffalo, NY: State University of New York Press, 1969; trans. R. Lamberton, *Porphyry on the Cave of the Nymphs*, Barrytown, NY: Station Hill, 1983.(Greek text with English translation.)

Porphyry (mid 3rd century AD) *The Homeric Questions*, ed. R. Schlunk, New York: P. Lang, 1993.(Greek text and translation.)

Porphyry (mid 3rd century AD) *Against the Christians*, ed. A. von Harnack, *Porphyrius. Gegen die Christen*, Berlin: Reimer, 1916; trans. R.J. Hoffmann, *Porphyry Against the Christians: The Literary Remains*, Frome: Prometheus Trust, 1994.(The former is Greek text, the latter an English translation of the fragments.)

Porphyry (late 3rd century AD) *Letter to Marcella*, ed. W. Pötcher, Leiden: Brill, 1969; trans. K. Wicker, *Porphyry the Philosopher, To Marcella*.(The former is Greek text and German translation, the latter an English translation.)

Porphyry (late 3rd century AD) *History of Philosophy*, ed. E. des Places and A. Segonds, *Porphyre. Vie de Pythagore, - Lettre à Marcella, - frg. de l' Historie de la philosophie*. Paris: Les Belles Lettres, 1982.(Parallel Greek text and French translation.)

Porphyry (late 3rd century AD) *On Abstinence from Animal Food*, ed. J. Bouffartigue and M. Pattilon, *Porphyre. De l'Abstinence*, Paris: Les Belles Lettres, 1977-94.(Parallel Greek text and French translation.)

Porphyry (late 3rd century AD) *Sentences Leading to the Intelligibles*, ed. E. Lamberz, *Porphyrius Sententiae ad Intelligibilia*, Leipzig: Teubner, 1975; trans. K. Guthrie, *Launching-Points to the Realm of Mind*, Grand Rapids, MI: Phanes Press, 1988.(The former is Greek text; the latter is an English translation of an earlier edition.)

Porphyry (late 3rd century AD) *Letter to Anebo*, ed. A.R. Sodano, *Porfirio. Lettera ad Anebo*, Naples: L'Arte Tipografica, 1958.(Greek text and Italian translation; "Anebo' was Porphyry's pseudonym for Iamblichus, so the Letter usually appears with editions of Iamblichus' *On the Mysteries*.)

Porphyry (mid to late 3rd century AD) *Select Works of Porphyry*, trans. T. Taylor, London, 1817; repr. Frome: Prometheus Trust, 1994.(Includes English translations and explanatory notes for *Abstinence from Animal Food*, *Cave of the Nymphs in the Odyssey* and *Auxiliaries to the Perception of Intelligible Natures*.)

Porphyry (mid 3rd to early 4th century AD) *Fragmenta*, ed. A. Smith, Stuttgart and Leipzig: Teubner, 1993. (Collection of surviving Greek and Latin fragments of Porphyry's works on Aristotle, Plato, metaphysics, science, history, religion and literature.)

Porphyry (early 4th century AD) *Life of Plotinus and The Enneads of Plotinus*, trans. A.H. Armstrong, Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 1966.(Parallel Greek text and English translation.)

Port-Royal

The reform of the abbey of Port-Royal-des-Champs in 1608 coincided with the vast movement of monastic reform which characterized the Counter-Reformation. In 1624 a second abbey was created, Port-Royal-de-Paris and, after some rivalry among spiritual leaders of the day, this was directed by Jean Duvergier de Hauranne, abbot of Saint-Cyran and one of the leaders of the parti dévot *hostile to Richelieu. In 1640 the abbot's friend Jansenius published the Augustinus, a* résumé *of Augustine's doctrine, of which five propositions on divine grace were condemned by the Vatican. Ecclesiastics in France were obliged to accept this condemnation, and the resistance of the nuns of Port-Royal brought about persecution, imprisonment and finally the destruction of the abbey in 1710. The intellectual history of the abbey extends far beyond theological quibblings, however. In 1626, Saint-Cyran defended Charron against the Jesuit Garasse and formed a firm alliance between the Pyrrhonism of Montaigne and the philosophy of Augustine. In the 1640s, Antoine Arnauld played an important role in the diffusion of Cartesianism, confirmed by the publication of the Logique de Port-Royal (1662). The 1670 publication of Pascal's Pensées can be interpreted as a symptom of the rivalry between Descartes and Gassendi in contemporary apologetics and, in the following years, the polemics between Arnauld and Malebranche played an important role in the definition of Christian rationalism.*

1 Rise and fall of Port-Royal

In June 1599, Jacqueline Arnauld was chosen as coadjutrix of the Cistercian abbey of Port-Royal-des-Champs, south of Paris near Versailles. On 5 July 1602, under the name of Mother Marie-Angélique de Sainte-Madeleine (Mother Angélique), she succeeded Jeanne de Boulehart as abbess. At that time, the crucial role that Port-Royal would play in the religious, political, philosophical and cultural world of seventeenth-century Europe could not have been anticipated.

A sermon preached by a visiting friar in March 1608 was the occasion of the spiritual conversion of Mother Angélique and, with the advice of Cistercian abbots and a number of spiritual directors from various orders, she introduced the strict rules of the Cistercians into the abbey of Port-Royal. The reform of Port-Royal thus coincided with the vast movement of monastic reform which characterized the Counter-Reformation: Port-Royal soon gained a considerable reputation and the reform spread to other monasteries of the Cistercian order. In May 1625, the nuns of Port-Royal-des-Champs were transferred to the new abbey of Port-Royal in Paris and, in July 1627, the community was transferred from the jurisdiction of the Cistercian order to that of the archbishop of Paris. After the creation of the Institut du Saint-Sacrement in 1633, the community became the subject of intense rivalry among the leading spiritual directors in Paris: the Oratorians around Bérulle, Sébastien Zamet (Bishop of Langres), Octave de Bellagarde (Bishop of Sens), and Jean Duvergier de Hauranne (Abbot of Saint-Cyran). The latter became the spiritual director of Port-Royal in 1635. He was a friend of Cornelius Jansenius (Bishop of Ypres), and their spiritual ambitions were based on a return to the authority of Augustine, to positive theology, and on opposition to the influence of the Jesuits in France. This had political implications, in so far as Saint-Cyran could be said to belong to the 'parti dévot', strongly opposed to Richelieu's foreign policy of alliance with Protestant nations to resist the pressure of the Habsburgs in Spain and Austria. Jansenius' pamphlet *Mars gallicus* (1635) is an indication of the political resistance to official foreign policy and, on the 14 May 1638, Saint-Cyran was arrested and imprisoned in the dungeon of Vincennes. He was released only after the death of Richelieu in 1643, and died himself a few months later.

Nevertheless, by this time, the movement of spiritual reform at Port-Royal had gained considerable impetus. In January 1637 a well-known lawyer, Antoine Le Maistre, retired from the professional world to seek spiritual guidance at Port-Royal-de-Paris; his example was followed by others and, in mid-1638, these 'Solitaires' withdrew to Port-Royal-des-Champs, accompanied by the school ('Petites Ecoles') of Port-Royal, recently founded in Paris. The great work by Jansenius, *Augustinus* (1640), aimed to give a faithful résumé of Augustinian theology and revived old quarrels on the nature and power of divine grace. On 6 March 1642, the papal bull *In eminenti* condemned the work of Jansenius and in 1643 and 1644 Antoine Arnauld produced his *De la Fréquente communion* and his defence of Jansenius. Port-Royal was henceforth to be known as the centre of 'Jansenist' (or, as Port-Royal theologians claim, 'Augustinian') theology. In 1649, Nicolas Cornet, 'syndic' of the Faculty of Theology of the Sorbonne, reduced Jansenius' doctrine to seven articles and submitted them to the Vatican for

examination; five of them were condemned in the papal bull *Cum occasione*, published on 31 May 1653, and this condemnation was renewed in the bull *Ad sacram* on 16 October 1656. This same year, a condemnation of Jansenist theology was demanded of all ecclesiastics. The resistance of the nuns of Port-Royal drew political persecution on the abbey, since Mazarin sought to exploit the Jansenist quarrel in his negotiations with the Vatican.

The year 1655 was important in the development of public opinion concerning theological affairs. The occasion that sparked events was the refusal of communion to the duke of Liancourt, a friend of Port-Royal, by Charles Picoté, a vicar of Saint-Sulpice, on the grounds that the duke had provided accommodation in his house for Toussaint Desmares and Amable de Bourzeis, both notorious Jansenists. Antoine Arnauld wrote two lengthy letters in defence of the duke, which had little effect, but the theologian then asked Pascal to try his hand: from January 1656 onwards, the *Provincial Letters* were an immediate success and contributed to the popular image of Jesuit casuistry and moral laxism (see Pascal, B.). Moreover, despite the expulsion of Antoine Arnauld from the Sorbonne, the Jansenist cause seemed to be under divine protection when, in March 1656, Pascal's niece, Marguerite Périer, was miraculously cured of a dangerous eye infection. Debates on the 'miracle de la Sainte-Epine' led Pascal to develop the notion of historical testimony and thus embark on the project of an apology, of which the *Pensées* provides the unfinished sketch.

But political interests proved too strong for Port-Royal. First Mazarin, then King Louis XIV, were each determined to eliminate this source of potential resistance to monarchical power. The abbey was forbidden to receive new nuns, the boarding school for girls was suppressed as were the 'Petites Ecoles', and the 'Solitaires' were expelled. The abbey was thus condemned to die and, despite the 'Peace of the Church' (a respite from persecution between September 1668 and April 1679), the exile of Antoine Arnauld and Pierre Nicole and the tight control exercised by the archbishop of Paris brought an end to Port-Royal. The last nuns were dispersed in 1709, and the abbey was destroyed the following year.

In 1713, the papal bull *Unigenitus*, condemning 101 propositions extracted from the book of *Réflexions morales* (1693) by Pasquier Quesnel, created new conflicts that lasted throughout the eighteenth century. Jansenism now left the moral and theological field and began a Parliamentary and political career.

2 Intellectual life

Much has been said (by L. Goldmann, in particular) of the Parliamentary links of the Jansenists and this sociological characteristic has been interpreted in terms of a 'tragic' philosophy attributed to Pascal and to Racine. Objections have been formulated by J. Orcibal and J. Mesnard. Beyond the extreme fragility of Goldmann's interpretation of 'Jansenist' authors, suffice it to say that all religious orders recruited their members from the Parliamentary milieu: Port-Royal was no exception. Furthermore, Port-Royal had many connections with the *noblesse d'épée*, as can be seen from the list of nuns, of girls at the boarding-school and pupils at the Petites Ecoles. A full sociological analysis of the world of Port-Royal has yet to be completed; the financial history of the abbey would also reveal many secrets. The Parisian group of friends cannot suffice to characterize the community, since a vast network of friends of Port-Royal was established throughout the country, concentrated in particular in the dioceses of sympathetic bishops at such as those at Angers, Alet, Beauvais, Rouen, Troyes, Châlons-sur-Marne, Montpellier and in Lorraine.

The intellectual history of the abbey is intricate. Many of the nuns themselves had considerable intellectual qualities and proved them in the archives which provided, in the following century, ample material for the historical defence of 'Jansenism'. Moreover, for the first time in Catholic theology, the resistance of the nuns to the demand for condemnation of Jansenius in 1656 was founded on the definition of the rights of the individual conscience: a major step towards the formulation, in the following century (and following the writing of Pierre Bayle), of a doctrine of religious toleration.

Among the friends of Port-Royal, cultural activity was extremely important. Apart from the vast theological productions of Saint-Cyran and Antoine Arnauld, the pedagogical activity of the Petites Ecoles gave rise to a number of works by Claude Lancelot, as well as to the *Grammaire générale et raisonnée* (1660) and the *Art de penser* (or *Logique de Port-Royal*) (1662). Arnauld d'Andilly produced influential translations of Biblical history and Patristics; Isaac Le Maistre de Sacy produced an important translation of the Bible, which reflects the

changing status of the layman in the Catholic church in the seventeenth century. Le Nain de Tillemont, a pupil of the Petites Ecoles, gained a great reputation as a historian. The influence of Jansenism on Racine, also a pupil at Port-Royal, has been much debated. Some critics discern an Augustinian influence in the works of Pascal, La Rochefoucauld, Nicole, Mme de La Fayette and Mme de Sévigné; La Fontaine was involved in the composition of a *Recueil de poésies chrétiennes et diverses* (1671), and the director of this volume, Brienne, was a close friend of Port-Royal and the probable author of the *Discours sur les passions de l'amour*. Augustinian moralism, which founded a portrait of human nature akin to that painted by Hobbes, was later to influence Bayle, Locke and Mandeville. Conversations of friends of Port-Royal have been recorded in the *Recueil de choses diverses* (1670-1). Outside literature, Philippe de Champaigne and his nephew (and adopted son) Jean-Baptiste were among the foremost painters of the day: Philippe de Champaigne's portraits of the theologians and nuns of Port-Royal are outstanding.

In the field of philosophy, Port-Royal was first characterized by the intervention in 1626 of Saint-Cyran in defence of Charron, the disciple of Montaigne, against the attack of the Jesuit Garasse. This can be interpreted as an alliance of Augustinian theology with Christian Pyrrhonism, and heralded the subsequent quarrels between rationalists and Pyrrhonists after the publication of Descartes' *Discours de la méthode* (1637) (see Descartes, R. §3; Pyrrhonism). The introduction of Cartesianism into Port-Royal opened a new era, sometimes called the 'second Port-Royal', strongly influenced by the authority of Antoine Arnauld, author of the fourth set of *Objections* to Descartes' *Meditations*. Arnauld was indeed extremely favourable to the 'new philosophy' of Descartes, regarded as a much needed replacement for the Thomist Aristotelian defence of religious faith (see Medieval philosophy). Charles Wallon de Beaupuis, a former pupil of Arnauld, was the director of the Petites Ecoles at Port-Royal. The duke of Luynes, a neighbour of the abbey in his château of Vaumurier, first translated into French Descartes' *Meditations* in 1647, the *Objections* being translated by Clerselier. Nicolas Fontaine gives an account of vivisection at Port-Royal, based on the Cartesian theory of animal-machines and, according to the testimony of his niece, Marguerite Périer, this was an aspect of Cartesian philosophy with which Pascal agreed. A manuscript of Louis Du Vaucel, published by G. Rodis-Lewis, testifies, however, that the adoption of Cartesianism was not unanimous at Port-Royal.

The publication of the *Logique de Port-Royal* (1662), with subsequent editions bringing a number of important additions, was a major event in the intellectual history of the seventeenth century. A first version was sent by Arnauld to Mme de Sablé in April 1660, and this copy may help to solve the vexed question of the role played by Nicole in the composition of the text. Furthermore, a note in the *Recueil de choses diverses* attributes a role in the composition to Le Bon, a teacher at the Petites Ecoles, who is supposed to have worked on notes by Descartes' disciple Clerselier. The work constitutes an attempt to present a synthesis of Augustinian, Cartesian and Pascalian thought, and exerted a strong influence on Malebranche and his recalcitrant Benedictine disciple, Robert Desgabets and, indeed, on the whole context of debate around the 'new philosophy'. This debate was particularly lively at the Oratoire, where André Martin composed, under the pseudonym of Ambrosius Victor, a systematic comparison of passages extracted from Augustine and Descartes (1667), and from which Bernard Lamy suffered exile after a series of Cartesian lectures (1675). It may be added that, whereas Arnauld remained faithful to Cartesianism throughout his life, strongly denouncing the sceptical work of Pierre-Daniel Huet, Nicole seems to have been lukewarm: he composed a stringent criticism of Desgabets' attempts to provide a detailed Cartesian account of transubstantiation, and his sympathy for Descartes' philosophy seems to have been limited to an adherence to the criterion of 'évidence'.

The publication of Pascal's *Pensées* (1670) was a new occasion for Cartesian thought to make itself felt in works emanating from Port-Royal. Recent critics interpret this edition as an attempt to disguise, by careful modifications of the text, a Gassendist critique of Descartes as Cartesian apologetics. Key terms in Pascal's vocabulary are marked by the influence of Gassendi, and yet Arnauld, who directed the editorial committee, managed to produce an apology compatible with Cartesianism. The success of the work was immediate, and it exerted an influence on subsequent philosophers, in particular on Malebranche, Bayle, Locke and even Hume.

Antoine Arnauld's philosophical controversies with Malebranche in themselves constituted an important chapter of intellectual life at Port-Royal. The controversies began in 1680 when Arnauld came across a manuscript version of Malebranche's *Traité de la nature et de la grâce*: despite Arnauld's last-minute attempt to discourage Malebranche, the treatise was printed and the Jansenist theologian promptly attacked the Oratorian's so-called

'Epicureanism' (see Epicureanism). A debate on the nature of pleasure and happiness ensued, in which Pierre Bayle played an important role by publishing detailed analyses in the *Nouvelles de la république des lettres* and finally coming down strongly in favour of Malebranche. In 1683 Arnauld's critique of Malebranche's *Recherche de la vérité* appeared in *Des Vraies et des fausses idées* (1683), which was to involve the two philosophers in a long and intense debate on the nature of ideas. Originally regarded as friend of Port-Royal, Malebranche became a bitter enemy of the Port-Royal theologians, denouncing them in the ironic formula 'personnes de piété' (see Arnauld, A. §3).

The paradoxically parallel influence of Epicurus, Montaigne and Augustine in seventeenth-century France put Port-Royal at the centre of debates on theological, ecclesiastical, moral, philosophical and literary questions. The Port-Royal theologians and their friends were quick to appeal to public opinion, and thus played a major part in the transformation of these debates from obscure, technical quibblings to major events in social and intellectual history.

Sellier, P. (1969) 'La Rochefoucauld, Pascal, saint Augustin', *Revue d'histoire littéraire de la France* 69: 551-75. (The first study to suggest a relation between La Rochefoucauld and Augustinian theology, a line of enquiry which has proved very useful.)

Posidonius (*c*.135-*c*.50 BC)

Posidonius of Apamea (Syria) was a Stoic philosopher and student of Panaetius. He taught in Rhodes. He combined a passion for detailed empirical research with a general commitment to the basic systematics of Stoic philosophy (which, however, he was willing to revise where necessary). As such he was probably the most 'scientific' of the Stoics. His wide-ranging investigations of all kinds of physical phenomena (especially in the areas of physical astronomy and meteorology) became particularly renowned, the best known case being his explanation of Atlantic tides as connected with the motions of the moon.

His most original philosophical contributions are to be located in the connected areas of psychology and ethics. Posidonius appears to have been committed to a slightly Platonizing version of Stoic psychology, according to which the passions are no longer regarded as a malfunctioning of the rational faculty, but as motions of the soul which take their origin in two separate irrational faculties (anger and appetite). This revised moral psychology is accompanied by some corresponding revisions in ethics such as the conception of moral education as the blunting of the motions of the irrational faculties.

1 Life and writings

Born in Apamea (Syria), Posidonius studied at Athens with the Stoics Antipater and Panaetius (that is, before 110 BC when the latter died). He settled in Rhodes where he founded a philosophical school of his own, and soon became one of the leading intellectual personalities of his time. He obtained Rhodian citizenship and held the highest political office (*prytanis*), Rhodes being at the time an independent ally of Rome. He represented Rhodes in an embassy to Rome where he negotiated with Marius in 87/86 BC. Earlier he had travelled in the western Mediterranean visiting Etruria, southern Gaul (where he studied the habits of the Celts), Spain (where he observed Atlantic tides at Cadiz) and North Africa. Back in Rhodes he continued his philosophical activities. Cicero attended his lectures in 77 BC. Pompey visited him in 66 and 62 BC, on his way to and back from his campaign against Mithridates. In 51 BC Posidonius revisited Rome on a second embassy. He died soon after.

None of Posidonius' writings survive, so we are dependent on fragments (quotations) and testimonia provided by other ancient writers. More than forty titles of works are attested, the most important ones being: *Protreptics*; *Physical Theory* (consisting of at least eight books); *On the Cosmos* (at least two books); *Meteorologica* (at least seven books); *On the Ocean*; *On the Gods* (at least five books); *On Fate* (at least two books); *On Divination* (five books); *On the Soul*; *Ethical Theory*; *On Passions*; *On Duty* (at least two books); *On the Criterion*; *Against Zeno of Sidon*; and *Histories* (fifty-two books).

The belief that Posidonius also wrote separate commentaries on some of Plato's works (*Timaeus*, *Phaedrus*, *Parmenides*) has been rather persistent, but is based on an unwarranted inference from the relevant ancient testimonies.

2 The Posidonian question

Modern scholarly interest in Posidonius as a philosopher in his own right goes back to the first collection of fragments, edited by J. Bake in 1810. This collection triggered rather than settled the question to what extent Posidonian material, philosophical as well as doxographical, can be found in various ancient sources. In the nineteenth and twentieth centuries opinions on what might count as the Posidonian 'corpus' have differed widely. Under the influence of German *Quellenforschung* Posidonius was credited with the intellectual authorship of many ideas in such different authors as Cicero, Varro, Manilius, Vergil and Seneca, usually on arbitrary grounds and without any explicit ascription in the passages at issue. The various pictures of Posidonius to which this 'pan-Posidonianism' gave rise usually exhibited strongly metaphysical or even mystical features. In the course of the twentieth century more sceptical approaches have gradually prevailed, and the sound methodological principle that every assessment of Posidonius' thought should be based on explicitly attested evidence was at the basis of the edition of the fragments and testimonia by Edelstein and Kidd (1972). The rival edition by Theiler (1982) is still rather indebted to the German pan-Posidonianist tradition. The account which follows is based on attested fragments only; references are to the fragments (fr.) and testimonia (T) as numbered in the edition of Edelstein and Kidd.

3 Logic

Posidonius followed Stoic orthodoxy in dividing philosophy into three parts: physics, logic and ethics. He was more explicit than others, however, in stressing the interconnection of these parts, likening philosophy as a whole to a living being with physics as blood and flesh, logic as the bones and sinews, and ethics as the soul (frs 87, 88). What little is preserved of his works on the bones and sinews of philosophy does not suggest any major departures from mainstream Stoic logic, although Posidonius may have been the first Stoic to examine the logical basis of relational syllogisms, that is, syllogisms making use of relations like ‘larger than’ or ‘equal to’ (fr. 191).

4 Physics

Also in the area of physics - which Posidonius claimed to be primarily concerned with ‘aetiology’, or finding causes (fr. 18, T85) - he subscribed to the Stoic orthodoxy in many respects. Yet a typical feature of Posidonian physics was the way he extended his aetiological investigations to the smallest details of the whole range of physical phenomena (thus inviting a comparison with Aristotle; see also T85). Indeed his explanations of the size and distance of the sun, its settings and risings, the moon, solar and lunar eclipses, comets, halos, rainbow, thunder, hail and winds became particularly renowned in later antiquity. Yet he regarded these various physical phenomena as in one way or another interconnected by cosmic sympathy (*sympatheia*) - a feature, incidentally, which some scholars have taken to be the exclusive hallmark of Posidonian physics, but which is in fact firmly rooted in previous Stoic philosophy. Of particular interest in this respect is his theory of the tides in the ocean as being connected with the daily, monthly and annual motions of the moon (frs 138 and 214-20). The conception of cosmic *sympatheia*, together with the identification of the active principle of the cosmos with ‘fate’ (fr. 103), also provides the philosophical basis for the practice of divination, which Posidonius, unlike his teacher Panaetius, zealously defended (frs 106-13).

On the other hand Posidonius did not hesitate to propose revisions of early Stoic physics where he thought they were required. Thus he probably rejected the early Stoic claim that the void surrounding the cosmos was infinite, arguing instead that it was just large enough to be able to receive the cosmos during its periodic conflagrations (fr. 97a-b) (see Stoicism §5). A more important change concerned psychology, where Posidonius followed Stoic orthodoxy in defining the soul as a ‘warm breath’ (fr. 139) and in claiming that it does not have irrational *parts*, located in different bodily organs, but sided with Plato (§14) and Aristotle (§§20, 22-3) against Chrysippus in maintaining that the soul has different *faculties* (frs 30-4, 142-6): a rational faculty, one irrational faculty responsible for anger and aggression, and yet another irrational faculty responsible for appetites (see Psychē).

5 Ethics

Posidonius made this moral psychology the basis of his theories concerning the nature of good and evil, the virtues and the end (frs 30, 38, 150a-b). He claimed that the origin of moral evil is not to be sought in the corrupting influence of external factors, as Chrysippus had thought, but in the emotional pull of the irrational faculties of the soul (frs 161, 169, 186). He accordingly rejected the Chrysippean conception of the passions as (false) judgments of the rational faculty of the soul (see Stoicism §19), arguing that it was unable to explain how emotions can arise and abate over time (fr. 165), that it would involve the counterintuitive consequence that animals and children, being irrational, do not have emotions (fr. 33), and that it left Chrysippus without a proper explanation of how emotions can arise in the first place (frs 34, 165). According to Posidonius, the passions are motions of one of the two irrational faculties of the soul (frs 151- 2), a conception which he claims to be firmly rooted in common experience (fr. 156), supported by the language used by the ancient poets as well as by ancient practices (fr. 164, 50-2), and sanctioned by the authority of Cleanthes (frs 32 and 166) and, possibly, Zeno of Citium (T91, 93).

Each of the three psychic faculties of the soul has its own natural object (a revision of the early Stoic theory of *oikeiōsis* or natural appropriation; see Stoicism §14): the two irrational faculties strive after power and pleasure respectively, whereas the rational faculty naturally seeks the moral good (frs 158, 160). Each faculty accordingly has its proper virtue. Only the virtue of the rational faculty may be termed ‘knowledge’ and can be taught. The virtues of the irrational faculties (that is, their restraint) are irrational and have to be acquired through habituation (fr. 31). Moral education thus becomes a kind of therapy: the rational faculty is to be given predominance and the movements of the irrational faculties should be blunted by habituation and good practices (fr. 169. 106-17).

The end (*telos*) is defined as 'to live contemplating the truth and order of all things together and helping in organizing it, in no way being led by the irrational part of the soul' (fr. 186; the misleading 'part' here may not represent Posidonius' original wording). Posidonius appears to have regarded this definition as a clarification of the early Stoic definition of the end as 'living in accordance with nature' (fr. 185) (see Stoicism §17).

Apart from his revisions in moral psychology, Posidonius appears to have remained faithful to the main tenets of Stoic ethics, such as those concerning the self-sufficiency of virtue or the moral value of wealth and health.

6 Mathematics, geography and history

Most of Posidonius' contributions to what we would call the 'special sciences' are to be classed under philosophy (physics), with the exception of his work in mathematics and (at least part of) his work in history and geography. According to Posidonius mathematics (including astronomy) does not belong to philosophy at all, being crucially different from physics in so far as it is merely concerned with the quantitative aspects of phenomena and hence unsuitable for finding the essence of things, that is, for aetiology (fr. 18, T85). Indeed he remained faithful to this principle in using mathematical constructs and methods for descriptive rather than explanatory purposes, for example, to estimate the circumference of the earth (fr. 202) or to construct an orrery (T86). Nevertheless he also studied mathematics as a subject in its own right, defending the method and principles of Euclidean geometry against Epicurean criticisms in his 'Against Zeno of Sidon' (fr. 47).

His geographical works and his *Histories* (a continuation of Polybius' historical work, covering the period from 145 to *c*.86 BC) constituted a 'mixed bag' of simply descriptive passages - such as those dealing with the length of the 'isthmus' of Gaul (fr. 248) or with the revolt of mining slaves in Attica *c*.100 BC (fr. 262) - and more philosophical elements. As an example of the latter we may note the theory of geographical zones (*klimata*), which is supposed to explain some of the ethnological characteristics of the people inhabiting various parts of the world (frs 49 and 169, 85-95). These characteristics in their turn were thought to explain certain historical actions of those people (see also fr. 272 on the Cimbri). Moreover, there is a more general link between historiography and ethics in so far as history as a whole is presented as a process of gradual decline caused by the preponderance of the irrational faculties of the soul (fr. 284).

7 Influence

Posidonius was highly esteemed in his own day, and his works were read and used by thinkers like Cicero. Yet the extent of his general philosophical influence is still a matter of debate and has certainly often been overestimated. Among later authors, such as Strabo, Cleomedes, and Alexander of Aphrodisias, he appears to have been primarily known for his detailed investigations in such special areas as meteorology and geography.

Positivism in the social sciences

Positivism originated from separate movements in nineteenth-century social science and early twentieth-century philosophy. Key positivist ideas were that philosophy should be scientific, that metaphysical speculations are meaningless, that there is a universal and a priori scientific method, that a main function of philosophy is to analyse that method, that this basic scientific method is the same in both the natural and social sciences, that the various sciences should be reducible to physics, and that the theoretical parts of good science must be translatable into statements about observations. In the social sciences and the philosophy of the social sciences, positivism has supported the emphasis on quantitative data and precisely formulated theories, the doctrines of behaviourism, operationalism and methodological individualism, the doubts among philosophers that meaning and interpretation can be scientifically adequate, and an approach to the philosophy of social science that focuses on conceptual analysis rather than on the actual practice of social research. Influential criticisms have denied that scientific method is a priori or universal, that theories can or must be translatable into observational terms, and that reduction to physics is the way to unify the sciences. These criticisms have undercut the motivations for behaviourism and methodological individualism in the social sciences. They have also led many to conclude, somewhat implausibly, that any standards of good social science are merely matters of rhetorical persuasion and social convention.

1 Positivist doctrines

In contemporary debates ‘positivism’ refers to a broad attitude about science and philosophy that has its origins in the social theories of Comte de Saint-Simon and Auguste Comte and the philosophical doctrines of the logical positivists. The positivists often did not agree which doctrines were essential to their position or how those ideas should be interpreted, and the term ‘positivism’ has come to stand for a set of ideas that some positivists would not have fully endorsed. Though they advocated all the ideas discussed below in some form, this entry concentrates on the ideas currently associated with positivism, for it is those doctrines that have been most influential in debates about the social sciences.

Saint-Simon and Comte advanced three ideas typical of positivism: (1) that science is the highest form of knowledge and that philosophy thus must be scientific; (2) that there is one scientific method common to all the sciences; and (3) that metaphysical claims are pseudoscientific. The second of these ideas, frequently known as ‘naturalism’, is most directly relevant to the social sciences. It says that the social realm, as part of the natural world, can and must be studied by standard scientific methods. For Saint-Simon and Comte, this meant that laws governed the social world, and that the job of the social sciences was to identify those laws. They also believed that society should be run by an elite who could discern these laws and use them to solve social problems.

Subsequent positivists advocated these core ideas but with new interpretations and additions. The logical positivists shared the antimetaphysical sympathies of Comte and also wanted philosophy to be ‘scientific’; they did not conceive of it as an empirical discipline. Instead they assimilated philosophy more to the model of logic, where the logician’s task was to formulate the a priori rules of valid inference and explicate basic logical concepts. Philosophy became primarily clarifying and formulating the rules and concepts of good science, and the logical positivists were thus committed to the existence of a single, universal a priori scientific method (see Logical positivism).

The logical positivists attacked metaphysics by bringing in the empiricist tradition (one foreign to Saint-Simon and Comte). They argued that sensory knowledge was the most certain and that any concept not directly about sensory experience should be ‘translatable’ into observational concepts. Those concepts that could not be so translated, primarily metaphysical concepts, were rejected as meaningless. This claim also led to a very specific and long-persuasive picture of science: science is divided into two parts - the observational and the theoretical - and theoretical terms must be definable in observational terms.

From these ideas the positivists drew several conclusions relevant to the social sciences. Since scientific knowledge came from applying an a priori logic of science, good social science must be value free (see Value judgments in social science §2). The logical positivists also thought that good science was unified science, and promoting the unity of the different sciences was one of their chief goals. By ‘unity’ they understood various

things. They thought there was one scientific method common to all the sciences, including the social sciences. They also thought that the different sciences could and should be unified by being reduced to physics.

2 Influence on the philosophy and practice of the social sciences

Positivism strongly influenced both the practice of the social sciences and philosophical views about them. Naturalism, the view that good social science embodies the scientific method common to the natural sciences, is the dominant approach among practising social scientists (see Naturalism in social science §1). Operationalism, the idea that all theoretical terms must be specified by the operations that measure them, has been influential in the social sciences and is a variant of the positivist ideal of translating theoretical terms into empirical ones; the notion of revealed preference in economics - the idea that preferences of consumers should be identified with their observable consumption patterns - has similar roots (see Operationalism §2). Behaviourism in political science has similar origins, for again the idea is that only explanations based on directly observable factors are scientifically adequate.

One attempt to formulate the positivists’ logic of science was Karl Popper’s idea that good science is falsifiable and has undergone severe tests (1962). Many philosophers and social scientists have tried to use Popper’s ideas to evaluate the social sciences. Popper himself argued that both Marxism and Freudian psychology were pseudoscientific because they were non-falsifiable. Similar doubts have been raised about economics, because economists often fail to reject their theories in the face of conflicting data (see Popper, K.R.).

Positivist assumptions have also influenced the use of statistics in the social sciences. Much social research uses statistical methods to test hypotheses and implicitly treats statistical inference as a mechanical, purely logical process. Social research also often reports only correlations between variables, drawing no conclusions about causes. Both practices have positivist origins. The early developers of modern statistics were sympathetic to positivism, and interpreted their results as a concrete implementation of the positivists’ a priori scientific method or logic of science. The refusal to draw causal conclusions comes in part from the positivist rejection of metaphysics, for many positivists thought causation an obscure metaphysical concept that should be rejected in favour of lawful regularities between observables. This emphasis on the observable also found a sympathetic ear among economists. Friedman’s famous defence of economics against the charge that its models were highly unrealistic argued that only predictions count (1953); unrealistic theories did not matter if they predicted the observed data (see Economics, philosophy of §4).

Another influential idea was the positivists’ notion that the various sciences should be unified by reducing them to physics. This was generally interpreted as the claim that the sciences form a hierarchy, with sociology reducible to psychology, psychology to biology, and biology to physics. These reductions were to show that the laws and theories of each science were derivable from or special cases of the science ‘below’ it. This positivist ideal fits well with the tradition in the social sciences known as methodological individualism, a doctrine asserting that all social phenomena must be explained as the outcome of individual behaviour. Methodological individualism remains the official philosophy of many economists, and philosophers have defended it as well. It is important to note, however, that much social science from the start rejected individualism for a holism that claimed macrosociological processes are essential to explanation; Comte, for example, advocated such a view (see Holism and individualism in history and social science).

Positivism also played a major role in numerous other debates in the philosophy of the social sciences. The idea of *Verstehen*, namely, that the social sciences rely on a special kind of intuitive insight to grasp the meanings of social phenomena, was roundly rejected by philosophers on the grounds that such a process could not be put in terms of observable data. Arguments that any social science dealing with meanings is scientifically inadequate also have positivist roots. Quine (1960), for example, argued that linguistic meaning is inherently indeterminate and thus scientifically suspect, because we cannot capture meanings in observational or physical terms (see Quine, W.V. §2). Related doubts about a science of meaning turn on the fact that meanings involve intensionality - substituting terms with equivalent meanings does not always preserve the truth value of statements. This makes it difficult to turn social science theories into axiomatized formal systems, a requirement for good science again inherited from the positivists.

Finally, positivism has influenced in subtle ways how philosophers think philosophy of social science ought to be

done. Relevant positivist assumptions include the following ideas: that philosophers should analyse scientific concepts; that such analyses ought to be roughly in the form of a definition or necessary and sufficient conditions; that the cognitive content of science can be fully and best expressed by identifying the formal structure of its theories; and that the epistemic evaluation of science requires reference only to the formal relation between data and hypothesis. These ideas still influence how philosophers practise the philosophy of social science. For example, the long debate over functional explanation in the social sciences has largely been framed in terms of finding the necessary and sufficient conditions for having a function or existing for a purpose (see Functional explanation §3). Much debate in philosophy of economics has been over what are the fundamental postulates of neoclassical economics, implicitly assuming that there is one theory to capture and that formalizing theories is the best way to understand a science. Current assessments of the social sciences also often ignore the social, psychological and historical factors that influence the social sciences as well as the empirical practices of social research; assessments are made instead by appeal to broad conceptual considerations about, for example, the nature of human agency (‘free will’) or the nature of mental phenomena (‘having meaning’). This practice goes back to the positivists’ emphasis on logical explication.

3 Criticisms and contributions

Positivism has, of course, been widely criticized. Perhaps most heavily criticized was the positivist claim that theories must be translatable into observational terms. This claim was criticized on several grounds: (1) the theory/observation distinction is difficult to draw in any sharp way, (2) attempts to translate theoretical terms into observational ones often presupposed theoretical terms in the process of describing the observational data; theoretical terms can be applied in indefinitely many ways to observations, and (3) even if the theory/observation distinction could be drawn, every scientific test involves background theoretical assumptions, thus showing that observational evidence has no absolute epistemic status. These criticisms also lead to doubts about the positivist notion of a unified science. If theoretical terms cannot and need not be reduced to observational ones, then it seems unlikely that the special sciences (biology, psychology, sociology, and so on) are reducible to physics or that they must be to be good science.

These criticisms certainly undercut positivist doctrines in the social sciences. Behaviourism and operationalism lose much of their motivation if good natural science is not translatable into purely observational terms. Methodological individualism likewise is much less plausible once the reductionist picture of scientific unity is rejected. In fact, a detailed literature has shown that precisely the same problems that prevent any reduction of the theoretical to the observational confront attempts to reduce the social to the individual.

The positivist search for an a priori universal scientific method was also criticized. Doubts about a universal scientific method came because the actual practice and history of science seems to show diverse methods across disciplines and historical periods. Doubts about the a priori status of scientific method resulted from the general philosophical attack, stemming from Quine’s work, on foundationalism, which is roughly the idea that philosophy stands outside the sciences and can make a priori judgments about them. The holistic picture of theory evaluation mentioned above also suggested that abstract scientific methods far from exhaust the practice of science and that much substantive, domain-specific information is involved in their application.

These criticisms have many implications for the social sciences. Statistical inference is not a mechanical way to get at the truth from the data but instead depends on substantive background assumptions. Also, understanding and evaluating social science requires looking at a complex combination of practices and assumptions rather than focusing on formalized theories alone. Some social scientists and philosophers draw further and much more drastic conclusions. For example, it is widely claimed that the social sciences need not worry about being good science by natural science standards because there is no universal scientific method and because good science is only a matter of convention - good science is only a matter of what persuades or what powerful people in the scientific community accept. Many social scientists and philosophers now advocate these views and thus see naturalism as misguided.

These conclusion are hasty. It is true that at some level of description the different sciences use different methods. Yet it also true that the different specialities within the same science, for example, biochemistry and ecology within biology, also use different methods. To avoid the conclusion that there are as many methods as there are scientists, we might distinguish abstract from realized methods. Scientific virtues such as testability and objectivity

are abstractions, ones that are embodied in different practices in different scientific domains. Differences in specific methods across time and place need not threaten naturalism if they result from adapting the same abstract scientific method to the specific circumstances of a given science. For example, the idea that a good test involves ‘controls’ for spurious influences is common to much good science, though how such control is achieved varies greatly from area to area. So there may be a broad core of scientific rationality that the social sciences can and must achieve, though its actual embodiments will no doubt depend on features specific to the social domain. Naturalism in this form remains a serious position.

It is likewise misguided to conclude from the demise of positivism alone that good science is merely a matter of what persuades, or a social construction. If methodological judgments are a not true a priori, they might none the less be empirically warranted. Good methods are those that effectively promote scientific goals such as truth. Thus we can grant the criticisms of positivism and yet still judge that some inquiries are better than others because experience shows they are better able to produce the truth. In short, the positivists’ a priori universal method and an ‘anything goes’ approach are not the only two alternatives. However, if judgments about good science are both empirical and dependent on how scientific virtues are realized, philosophy of social science then must look carefully at the actual practice of social research and the distinction between philosophy and social science becomes blurred.

Positivism, Russian

Positivism in Russia was not a separate, well-defined philosophical school but, rather, a broad, multidisciplinary current of thought, characterized by a cult of 'positive science', commitment to scientific, empirical methods and rejection of the metaphysical tradition in philosophy. As a rule, Russian positivists sympathized with materialism, although distanced themselves from the metaphysical assumptions of materialist philosophy. Their philosophical aspirations were usually limited to the investigation of specific problems, but their optimistic belief in the power of science could push them in the direction of an all-embracing 'scientific philosophy'.

In accordance with the naturalistic evolutionism of the second half of the nineteenth century, scientific philosophy involved the conception of objective laws of development and biological and/or sociological relativism - both incompatible with the ethicist standpoint. Many Russian thinkers, especially the so-called 'subjective sociologists', tried to combine positivist scientism with ethicism, claiming an independent status for moral values. Their efforts, however, could be successful only at the expense of abandoning the scientific rigour demanded by consistent positivists. Hence their views were semi-positivist rather than positivist. Through undermining the arrogant self-confidence and monopolistic claims of the crude forms of positivistic scientism, they paved the way for the outspoken revolt against positivism at the end of the 1890s.

1 Dogmatic and critical positivism

The founder of positivism, Auguste Comte, became known in Russia as early as the late 1840s. His critique of metaphysics and his conception of the three stages of human development (theological, metaphysical and positive) influenced Russian radicals of the 1860s, especially D. Pisarev (see Russian Materialism: 'the 1860s'), and Russian populists of the 1870s, especially Mikhailovskii (see Lavrov, P.L.; Mikhailovskii, N.K.). For the latter Comte was more palatable than Herbert Spencer because he recognized the validity of a 'subjective method' in sociology and did not claim that a positivist approach to social philosophy was incompatible with value judgments.

The most consistent adherent of Comtian positivism in Russia was Grigory Vyrubov (1843-1913), active mostly in France, where he became a personal friend of Littré and a co-founder of *La Philosophie positive*, the chief organ of French positivism. His philosophical standpoint, expressed most clearly in his article 'Le certain et le probable, l'absolu et le relatif' (in the first volume of *La Philosophie positive*, 1867) is thoroughly dogmatic. Its basic proposition is that scientific knowledge can lay claim to absolute truth and that the opposition between the absolute and the relative is in itself relative, because anything real that can be translated into the language of scientific laws can be called absolute. Following Comte, Vyrubov dismissed not only classical ontology but also epistemology, for which he proposed to substitute the methodology of individual sciences. Hence he was very hostile to any sign of a renewal of interest in Kantian criticism (see Kant, I. §4).

A different type of positivism was represented by Vladimir Lesevich (1837-1905). He accused Vyrubov of a naïve belief that all problems could be solved by science and postulated that positivism should concentrate on elaborating its own theory of knowledge. This required a rapprochement between positivists and Neo-Kantians. Positivism, Lesevich maintained, should become a '*critical* philosophy of reality'. To achieve this, positivists should learn from Kantian epistemological criticism without accepting the possibility of a priori knowledge.

Lesevich expounded these views in the 1870s. A decade later he drew near to the empiriocriticism of Ernst Mach and became the chief Russian representative of the 'second positivism', emphasizing the importance of epistemological reflection. On the other hand, he argued that epistemology should cease to exist as a distinct specialized discipline separated from science. In his book *What is a Scientific Philosophy?* (1891) he advocated the view that the task of 'scientific philosophy' was to make science 'philosophical', instead of just making philosophy 'scientific'.

In his theory of the social sciences Lesevich tried to mediate between positivism and the populist 'subjective method'. Lavrov and Mikhailovskii, he argued, were right in their criticism of Spencer's 'objectivist' approach to social evolution. Epistemological reflection shows that only the abstract sciences can make use of purely objective methods; the applied sciences are directed towards activity, and therefore have to solve problems of value judgments and value implementation. Many arguments for this line of reasoning were to be found, of course, in the

works of the Neo-Kantians (see Neo-Kantianism, Russian §2).

2 Positivism and psychology

In the positivists' discussions on 'scientific philosophy' much attention was paid to psychology, which was often confused with epistemology. Vyrubov simply reduced epistemology to psychology, and even Lesevich was convinced that epistemology was largely based on psychological data.

The most extreme representative of positivistic 'psychologism' in the interpretation of the classical problems of philosophy was a professor at Moscow University, Matveii Troitskii (1835-99). His *Nemetskaia psikhologiia v tekushchem stoletii (German Psychology of the Current Century)*, (2 volumes, 1867), was a vehement attack on the philosophical bias of German psychology, written from the point of view of English empirical, associationist psychology. His chief work, entitled *The Science of the Spirit* (2 volumes, 1882), was an attempt to provide a psychological interpretation of logic.

A more sophisticated version of psychologism was advocated by a liberal historian and philosopher, Konstantin Kavelin (1818-85). His main philosophical work*, Zadachi psikhologii (The Tasks of Psychology)* (1872), was a cautious defence of German Idealism, through interpreting it as a disguised form of psychological investigation which concentrated on the active side of the human psyche. In his theory of the relation between mind and body Kavelin represented a standpoint halfway between psychophysical parallelism and interactionism. This position did not satisfy either the materialists or the consistent idealists and spiritualists. The eminent physiologist Ivan Sechnov attacked Zadachi psikhologii for the treatment of psychic processes as autonomous phenomena, while the Slavophile Iurii Samarin (see Slavophilism) accused Kavelin of exaggerating the soul's dependence on the body and external environment.

Nikolai Grot (1852-99) was initially a more militant and consistent positivist. He studied under Troitskii and his first works - his master's thesis on the psychology of sense perception and his doctorate on the psychological interpretation of logic - displayed a consistently associationist standpoint. He also tried to justify 'naïve realism' in epistemology and deterministic evolutionism in the theory of mind.

In 1886 Grot was appointed professor at Moscow University and shortly afterwards became president of the Moscow Psychological Society. In 1889 he founded the journal *Problems of Philosophy and Psychology*. This gave him an influential position in academic philosophical circles in Russia. In the first issue of the journal he published a programmatic essay on the need of elaborating a distinctively Russian philosophical culture. His own philosophical position had by then undergone a substantial change: he turned away from positivism and openly declared his conversion to metaphysics. This new philosophy of 'monodualism' was to be a synthesis of monism and dualism and a resolution of ontological antinomies in the idea of God. But it was not a return to the speculative constructs of German Idealism: in his article 'What is Metaphysics?' (1900) Grot took care to explain that he meant an inductive metaphysics, attempting to base itself on the data of inner experience and therefore closely linked to psychology. Towards the end of his life he tried to reconcile his new system with positivistic scientism. This was owing to his interest in the energetics of Wilhelm Ostwald, which revived his belief that natural sciences could provide a solution to metaphysical problems.

3 Positivism and sociology

The field in which Russian positivism made its most valuable contribution was sociology. The most philosophical among the positivist sociologists in Russia was Evgenii de Roberty (1843-1915), the follower of Comte, a friend of Vyrubov and a contributor to *La Philosophie positive*. He was one of the first representatives of self-conscious sociologism, that is, a point of view which maintains that social phenomena represent a specific property of organized matter, and therefore cannot be reduced to, or explained by, any wider class of better-known phenomena. Hence sociology should be a new fundamental discipline, completely independent of biology, psychology or economy. De Roberty developed this view in his major work in Russian, entitled *Sociology, Its Basic Task and Methodological Peculiarities* (1880).

Philosophical implications of this standpoint, elaborated mostly in de Roberty's works in French (such as *L'Inconnaissable*, 1889; *Sociologie d'action*, 1908; *Le Concept de la raison et les lois de l'univers*, 1912), included the view that an isolated individual cannot be a thinking being and therefore psychology ought to be

based on sociology, and not vice versa. Another implication was the rejection of the classical definition of truth: objective truth, de Roberty argued, cannot exist, since truth is only a matter of collective experience; the difference between objective and subjective boils down to the difference between individual experience that has been totally dominated by collective experience, and individual experience that has been subjected to collective experience only to a minor extent. Finally, de Roberty's conception of the social roots of knowledge was linked to a philosophical interpretation of sociality as a specific and supreme form of energy - a 'supra-organic' energy, arising out of the interaction of many minds.

A different version of the Comtian tradition was represented in Russia by the outstanding historian of legal institutions, Maksim Kovalevskii (1851-1916). He saw himself as a supporter of Comte and, at the same time, a disciple of Marx (by whom he was befriended). In sociology he was a typical evolutionist, convinced of the uniformity and universal applicability of the basic laws of social development (see his *Sociology*, 2 volumes, 1910). He defined progress as the strengthening of the bonds of human solidarity - the constant expansion of the 'environment of peaceful coexistence', from tribal unity through national patriotism to the solidarity of the whole human race.

In his political views Kovalevskii was a moderate liberal. The liberal belief in universal laws of social progress was questioned by populist sociologists such as Lavrov and Mikhailovskii, who wanted Russia to develop differently from the West. As a rule, this course involved a departure from positivist scientism. The most positivistic among the populist theorists was the historian Nikolai Kareev (1850-1931). In his theoretical works, which include *Osnovnye voprosy filosofii istorii (Fundamental Problems of the Philosophy of History)* (1883) and *Etiudy sotsiologicheskie i filosofskie (Sociological and Philosophical Studies)* (1895) among others, he recognized four types of knowledge: numenological knowledge, being outside the scope of positive science; phenomenological knowledge, dealing with the phenomena themselves; nomological knowledge, determining the general laws; and deontological knowledge which justifies our ideals. He conceived of history as a phenomenological science, dealing with individual events; the task of sociology was to formulate general laws of historical development. The existence of such laws, however, did not exclude, in Kareev's view, the importance of individual choices; hence the need to supplement sociology by deontological, ethical knowledge. In this way Kareev tried to reconcile the positivist (and Marxist) conception of the objective laws of historical development with populist 'subjective sociology'.

4 The revolt against positivism in social philosophy

At the turn of the century Russian philosophy and social thought underwent a radical reorientation, known as the revolt against positivism. A peculiarly important role in this revolt was played by a group of thinkers (Pëtr Struve, Nikolai Berdiaev, Sergei Bulgakov and a few others) who wanted to oppose positivistic scientism (as leaving no place for moral ideals) and, at the same time, to resist populist 'subjectivism' (as containing an element of relativism and thus depriving moral ideals of objective validity). They realized this double task by embracing transcendental (Neo-Kantian) idealism, and soon developed it into transcendent (metaphysical) idealism; the final stage was an openly religious philosophy (see Russian Religious-Philosophical Renaissance §5).

Despite defining their main adversary as positivism, the thinkers in question did not engage in polemics against classical Western positivists and tended to ignore the adherents of positivism in Russia. Instead, they concentrated on the critique of Marxism, as interpreted by the theorists of the Second International. It was so because most of them were former Marxists and, more importantly, because the entire Russian intelligentsia saw the last word of the positive science of society in the 'scientific socialism' of Marx, and not in the theories of Comte or Spencer. In his populist phase, before becoming 'the Father of the Russian Marxism', Georgii Plekhanov defined Marxism in the Comtian fashion: as representing the 'positive stage' in the development of social theory. As a Marxist, he defended the position of a rigorously scientistic objectivism, according to which ethical ideals must be derived from, and coincide with, the objective laws of historical necessity. Owing to this, the initial phase of the revolt against positivism in Russia took the form of a confrontation between deterministic Marxism and Kantian ethical idealism.

Positivist thought in Latin America

Between 1850 and the 1920s European positivism became a major intellectual movement in Latin America. It asserted that all knowledge came from experience; that scientific thinking was the model for philosophizing and that the search for first causes or ultimate reason typical of religion and metaphysics, was an obsolete mode of thinking. Positivism set out to discover the most general features of experience. Its tasks were to use them to explain and predict phenomena, to develop a social science that would furnish objective grounds for moral choice and to help create the best society possible.

In Latin America positivism became a social philosophy which represented a cogent alternative to romanticism, eclecticism, Catholicism and traditional Hispanic values. It offered the prospect of a secular society in which the knowledge gained from science and industry would bring the benefits of order and progress. It assumed that the social sciences had the power to improve the human condition and it demanded political action. Three main currents were in evidence: autochthonous positivism indigenous to the region and concerned with local social and political issues, social positivism derived from Auguste Comte and stressing the historical nature of social change, and evolutionary positivism influenced by Herbert Spencer and asserting the biological nature of society.

Autochthonous positivism emerged in the 1830s from the influx of liberal ideas which followed the wars of independence fought on the US continent by those wishing to gain freedom from Spain. Urging an intellectual revolution, swift social change and material progress, autochthonous positivism paved the way for European positivism proper. Social positivism appeared around the 1850s and argued for the necessity of educational reforms to solve the continent's problems. It required participation in political life and became a radical force in spite of opposition from supporters of the status quo. By the 1880s evolutionary positivism had steered the movement in a conservative direction in support of laissez-faire *policies, individualism and gradual change.*

1 European positivism

Also called naturalism, scientism and social Darwinism, European positivism was first defined by Saint Simon as the philosophic application of scientific methods to human affairs. Auguste Comte systematically reshaped this insight into a method, a philosophy of science, a theory of development and a polity in *Cours de philosophie positive (Course of Positive Philosophy)* (1830-42).

Positive science does not acknowledge anything beyond the objective relations between phenomena given in experience. The method is to observe these relations and generalize them as coherent principles with which to explain reality. The scientific principles which result from these generalizations depend on the stage of development of the science. According to Comte's law of the three stages, the sciences, societies and the intellect pass through the mythical, metaphysical and positive stages, each representing a characteristic type of explanation of social structures and mental development. The sciences have progressed at different rates: the more general sciences, astronomy and physics, overcome the metaphysical stage earlier than the more specific sciences, such as chemistry or biology, which take longer. The last science to become positive was sociology. Its task was to solve the problems of attaining order and progress in society. In the *Système de politique positive (System of Positive Philosophy)* (1851-4) Comte describes the one society capable of achieving these goals, the sociocracy: a dictatorship of the proletariat and altruistic capitalists, under the moral tutelage of sociologist-priests of the Religion of Humanity.

In England, John Stuart Mill subscribed to positivism in early editions of *System of Logic* (1843) but recanted in *Auguste Comte and Positivism* (1865) because of the social and political implications of Comte's *Système de politique positive (System of Positive Philosophy)*. Herbert Spencer at first accepted Comte's stand on metaphysics and epistemology but eventually disagreed over the deeper nature of change in his essay *Reasons for Dissenting from the Philosophy of M. Auguste Comte* (1864). In *Social Statics* (1851) and later in *First Principles* (1862), Spencer developed an evolutionary principle that predated Darwin's formulation in 1859, which said that organisms are constantly challenged by the environment and other organisms. To survive they must adapt and pass on this adaptation to their offspring. This struggle for survival must produce stronger, more aggressive and cunning individuals, as only the fittest can survive. Like organisms, societies compete for limited resources. To survive they must adapt to internal or external changes. Complex societies which manage to survive, such as those

in Europe, are the fittest. The struggle leaves no room for altruism, a lesson not to be lost on political economy, since only policies that stimulate individual competition but do not interfere with natural development, can increase a society's chances of survival.

2 Latin American positivism

In Latin America, European positivism gained widespread attention as a scientific philosophy that offered solutions to problems which overburdened the continent, such as lack of freedom, political anarchy, venality and economic chaos. Social positivists pointed to the continent's lack of development. Their solution was to reach the positive stage through lay education. It was to de-emphasize rhetoric and literature and teach mathematics and science instead of theology. The resultant effect would be better citizens free from superstition or dogma, motivated by altruism and competent to use the social sciences to reorganize society and develop industry. Evolutionary positivists diagnosed society as sick as a consequence of inferior racial mixtures. Their solutions were to improve the racial stock and stimulate economic growth through European human and capital migration, encourage individual independence and adopt a *laissez-faire* policy.

Both positivist camps justified their views with evidence gathered from the sciences. Furthermore both envisaged that the future result lay in a technological industrial society with a structure and wealth similar to that of the more civilized European nations. Another reason for the favourable reception of European positivism was the presence of an autochthonous variety. The ideas that had given rise to positivism in Europe had been discussed in Latin America before the wars of independence. These ideas incited a rejection of traditional Hispanic values and Catholic thought and fostered an appreciation of science and its potential for guiding reform. Autochthonous positivism has been portrayed as a parallel development, although could also be one of historical opportunism. Indeed, social or evolutionary positivists called select figures autochthonous positivists to capitalize on their prestige and legitimize positivist claims historically.

For details about the progress of positivism in Latin America, the historical circumstances of individual nations have to be taken into account. The most interesting are Argentina, Mexico, Brazil and Chile.

3 Argentina

In Argentina the first expression of a philosophy akin to positivism is found in the works of Domingo Sarmiento and Juan Bautista Alberdi (see Argentina, philosophy in). Anticipating Spencer, Sarmiento (1845) pointed out the importance of ethnic and geographic factors in the formation of political character. For both philosophers humanity progresses from either a bucolic, or barbarian state to a complex urban culture, which is the road to civilization. Later in *Conflictos y armonías en las razas de América (Conflict and Harmony Among the Races in America)* (1883), Sarmiento adopted a racism justified by Spencerian evolutionism. He claimed that Latin America's lack of progress was due to racial inferiority deriving from the mixture of Indian, African and Mediterranean blood. He thought progress could only be made by improving the racial mixture through unrestricted immigration from northern European countries, such as Germany or Denmark. Alberdi's *Bases y puntos de partida para la organización política de la República Argentina (Foundations and Points of Departure of the Political Organization of the Argentine Republic)* (1852) foreshadowed arguments made by social positivists. In it he claimed that Argentina's social problems were the result of outdated ideas and traditions. He thought that reforms should be moral and educational and they should teach individuals self-reliance for self-rule. Alberdi joined Sarmiento's call for increased European immigration. They agreed that to govern was to populate, that is, to educate, improve and civilize. But in order to civilize through population a civilized population was needed in the form of European immigrants. Comtian positivism was introduced in 1872 into the Paraná Teachers College by Pedro Scalabrini and in 1910 at the National University of La Plata by J. Alfredo Ferreira. As positivism became so institutionalized, its influence was to prove long-lasting. It concerned itself mainly with scientific problems and educational improvements and voiced its proposals in journals, such as *La Escuela Positiva* (1894-9) and *El Positivismo: Órgano del Comité Positivista Argentino (Positivism: Organ of the Argentine Positivist Committee)* (1925-35), the latter the organ of the Comité Positivista Argentino.

Evolutionary positivism gained popularity among scientists at the University of Buenos Aires, such as psychiatrist José María Ramos y Mejía, palaeontologist Florentino Ameghino, sociologist Carlos Octavio Bunge and José Ingenieros, although they did not found a school. However, they did exercise considerable influence. An important

exponent was Ingenieros, a psychiatrist by training who also distinguished himself in sociology and philosophy. In *Principios de psicología (Principles of Psychology)* (1911), Ingenieros begins as a committed evolutionist, but admitted the need for improvement because he felt inductivism neglected the speculative aspect of science. As a solution, in his book *Proposiciones relativas al porvenir de la filosofía (Propositions About the Future of Philosophy)* (1918), he proposed an experiential metaphysics that could generate future scientific hypotheses. Ingenieros also found evolutionary ethics unable to account for human ideals and in *Hacia una moral sin dogmas (Towards a Moral Society Without Dogma)* (1917) he pursued an idealism that can only be justified in evolutionary terms.

4 Mexico

As early as 1833 José María Luis Mora anticipated positivism by defining it as a practical attitude opposed to the theoretical and espoused by those who sought newer educational forms to replace the old colonial dogmatism (see Mexico, philosophy in). In 'Revista política de las diversas administraciones que la República mexicana ha tenido hasta 1837' (Political Review of the Many Administrations the Republic has had Since 1837) (1837), Mora expressed dissatisfaction with the anarchy which followed independence and asserted that social progress would finally be made when Mexicans adopted a liberal attitude which guaranteed individual autonomy. The Mexican-American War (1845-8) and the French intervention (1863-7) reinforced this opinion and in 1867 President Benito Juárez called on Gabino Barreda, a student and follower of Comte, to reform education. The goal was an educated class that would lead the country out of economic stagnation and political chaos towards modernization and industrialization. Barreda believed that Mexico had undergone a political revolution and was ready for an intellectual one. This meant giving up Catholicism and liberalism as remnants of the theological and metaphysical stages for a new order akin to the positivist polity. According to Barreda, societies could progress only if they reached a consensus of opinion like that in the sciences. Thus, a scientific education was a necessary step towards progress.

Enactment of the public education law institutionalized Barreda's suggestions at the secondary level. A decade later a new class of intellectuals emerged who were trained along positivist lines. This generation, however, abandoned Comte for Spencer's evolutionism. They founded a political party, los Científicos, which advocated economic solutions and individual initiative over educational reforms. They supported the government in power from 1892-1910. The most interesting exponent of los Científicos was Justo Sierra. In *The Evolution of the Mexican People* (1900), Sierra uses the evolving organism analogy to argue that the cause of Mexico's illness was the sudden transition from a primitive to a militaristic society. The symptoms were revolutions and political atavisms. To restore health, what was needed was gradual evolutionary growth.

5 Brazil

Brazil's nineteenth-century intellectual development differed from the rest of Latin America (see Brazil, philosophy in). Colonized by Portugal, Brazil lacked universities and schools of philosophy. In 1821, without war or revolution, it became an independent monarchy. Social positivism was introduced by Luís Pereira Barreto and Benjamin Constant Botelho de Magalhães to science students around the 1870s at the Military School of Rio de Janeiro. Pereira Barreto eloquently listed in *As Três Filosofias (Three Philosophies)* (1874) the advantages of Comte's positivism and the need to liberate Brazil from religious dogma. Constant had become acquainted with Comte in 1857. He founded the Sociedade Positivista in 1871 and discussed positivism after 1873 in his science and mathematics lectures. Even the most orthodox aspects of social positivism were well received. Miguel Lemos and Raimundo Teixeira Mendes converted to Comte's Religion of Humanity. In 1881 they founded the Templo da Humanidade.

Evolutionary positivists formed a smaller yet influential group among lawyers at the Recife Law School. Its most important exponents were Tobias Barreto, author of *Estudos Alemães (German Studies)* (1882) and his students, Sílvio Romero and Clóvis Bevil qua, the latter one of the authors of Brazil's civil code. They criticized social positivists, particularly the orthodoxy, for suggesting abstract morality rather than concrete economic advances as remedies for Brazil's problems.

Antagonisms between social and evolutionary positivists worsened after 1888 when Constant led the overthrow of the monarchy. In shaping the new republican constitution, social positivists successfully argued for the separation

of Church and state, the abolition of slavery and the establishment of a lay educational system. Even the national flag contained the positivist motto *Ordem e Progresso* (Order and Progress). Their more radical proposals, such as the establishment of a sociocracy and making the Cult of Humanity the official state religion, were blocked by evolutionists and liberals at the national level, although they remained part of certain state constitutions like that of Rio Grande do Sul.

6 Chile

Chile produced several social positivists, but scarcely any evolutionists. The earliest were José Victorino Lastarria and Francisco Bilbao, both students of Venezuelan humanist Andrés Bello while he resided in Chile. Lastarria came across Comte's ideas in 1868, although he had anticipated them in 'Investigaciones sobre la influencia social de la conquista y del sistema colonial de los Españoles en Chile' (Investigation into the Social Influence of the Conquest of Spanish Colonialism in Chile) (1844) in which he held that all historic movement was towards freedom and progress and that the colonial past, full of errors and dogmas, had to be overcome. Bilbao also blamed the colonial past and Catholicism in particular for Chile's lack of development. In *Iniciativa de la América: idea de un congreso federal de las repúblicas (American Initiative: The Idea of a Federal Congress of Republics)* (1856), he suggested the creation of a continental federation of republics which would allow equality, freedom of worship, universal education and would unify the continent under an international law.

As in Brazil, an orthodoxy appeared, led by brothers, Jorge and Juan Enrique Lagarrigue, who had read Comte's works in the 1870s. An eloquent writer, Juan Enrique applied a positivist analysis to issues of national and international peace, the role of women, socialism, the right to strike and the duty of the priesthood of Humanity to mediate between workers and patricians. He attacked parliamentary governments as bankrupt because they rested on metaphysical foundations. This stand clashed with less orthodox positivists such as jurist Valentín Letelier. Letelier had become acquainted with Comte at the same time as the Lagarrigue brothers and admired the positivist programme, but could not accept the religious dogma or the absolutism of the *Système de politique positive (System of Positive Philosophy)* (1851-4). This difference was most evident during the conflict in 1891 between an executive backed by conservatives and a liberal congress. Letelier sided with the congress on liberal grounds while the Lagarrigue brothers argued for a dictatorship of the executive to represent another step towards sociocracy.

7 Positivism elsewhere in Latin America

In other countries positivism was not as widespread. Uruguayan evolutionism was as much a reaction to an idealist and spiritualist philosophy as to political chaos and moral corruption. Positivists tried to improve the nation's morality as well as their material wealth through economic, political and educational reforms. In Cuba, a Spanish colony until 1898, there were no supporters of social positivism, but Spencer had an advocate in Enrique José Varona. Eugenio María de Hostos of Puerto Rico, also developed a sociology along evolutionist lines. Ecuadorean Juan Montalvo, Peruvian Manuel González Prada and José Martí, for example, found positivism a convenient framework in which to cast moral and political ideas without being committed to the doctrine.

8 The decline

Positivism declined towards the end of the nineteenth century. Intellectually it had become stifled and internal squabbles depleted its ranks. Politically it had shifted from being liberal and reformist to become conservative and inactive. Policies were too vague or impossible to implement, or else they were based on insubstantial empirical evidence. Los Científicos fell catastrophically during Mexico's revolution in 1910. Positivism was found to be philosophically inadequate. Alejandro Korn and Francisco Romero eroded its credibility in Argentina. In Uruguay, the philosophies of Carlos Vaz Ferreira and the literary works of José Enrique Rodó offered better alternatives. In Mexico, José Vasconcelos and Antonio Caso pointed to the doctrinal poverty of positivism. Eventually, vitalism, Marxism, existentialism, Platonism and a general return to classical philosophy offered more articulate views. By the 1920s positivism was a term of censure. However, its influence proved subtly pervasive as elements of the doctrine were evident in the views of its strongest detractors. As a legacy it left a trust in technological change and a belief in popular education and economic prosperity.

Possible worlds

The concept of Possible worlds arises most naturally in the study of possibility and necessity. It is relatively uncontroversial that grass might have been red, or (to put the point another way) that there is a possible world in which grass is red. Though we do not normally take such talk of possible worlds literally, doing so has a surprisingly large number of benefits. Possible worlds enable us to analyse and help us understand a wide range of problematic and difficult concepts. Modality and modal logic, counterfactuals, propositions and properties are just some of the concepts illuminated by possible worlds.

Yet, for all this, possible worlds may raise more problems than they solve. What kinds of things are possible worlds? Are they merely our creations or do they exist independently of us? Are they concrete objects, like the actual world, containing flesh and blood people living in alternative realities, or are they abstract objects, like numbers, unlocated in space and time and with no causal powers? Indeed, since possible worlds are not the kind of thing we can ever visit, how could we even know that such things exist? These are but some of the difficult questions which must be faced by anyone who wishes to use possible worlds.

1 Pros and cons

Although known to Leibniz, it was not until the middle of the twentieth century that possible worlds came to occupy the attention of a significant number of philosophers and logicians (see Leibniz, G.W. §3). While this was initially due to the discovery that possible worlds permitted the formulation of a model-theoretic semantics for modal logic, it gradually became clear that possible worlds could be used to shed light on many other notions which had been regarded as problematic: intensional logic, counterfactuals, propositions and properties are but some of the areas illuminated by possible worlds. Indeed, some have even argued that the existence of possible worlds is a tenet of our ordinary common-sense beliefs. It is uncontroversially true that there are many ways the world could have been - but what are these many ways but possible worlds under another name?

However, although possible worlds may provide solutions to old problems, they raise new difficulties of their own. Since possible worlds are not the kind of thing with which we can causally interact, how do we know that there are such things, and how have we come to possess the kind of modal knowledge we credit ourselves with? Then there is the problem of transworld identity: how one and the same object can exist at different possible worlds. The problem arises for the following reason: not only is it possible that there might have been people who were twelve feet tall, Quine himself might have been twelve feet tall. In possible worlds terms, this means that there is a possible world at which Quine is twelve feet tall, apparently making Quine exist in more than one world.

When it comes to questions about their metaphysical nature - what kinds of things possible worlds are - there is very little agreement. It is agreed that possible worlds must be capable of representing many different ways the world could have been, and there can be no possible worlds in which grass is both green and red; but whether possible worlds are abstract or concrete, whether they exist independently of us or are our own creation, whether they have structure or are simples - are all contentious issues.

2 Extreme realism

For the extreme realist, all possible worlds are on a par: there is no distinction in kind between the actual and the possible. All that marks off the actual world from the infinitely many merely possible worlds is that the actual world is the world we happen to inhabit. Just as the actual world contains flesh and blood human beings, so some merely possible worlds contain flesh and blood human beings. Just as the actual world is made up of concrete spatio-temporally extended objects, so other possible worlds are made up of concrete spatiotemporally extended objects.

At first sight it appears that the extreme realist must solve the problem of transworld identity by having one and the same object literally appearing in more than one world. But there is an ingenious alternative. Quine might exist at a possible world w not because he is a part of w, but because w contains some other person (call him ‘Kwine’) who *resembles* Quine. If Kwine and Quine share certain properties, if they lead similar lives and have similar parents then Kwine is said to be Quine’s *counterpart*. It is possible for Quine to be twelve feet tall if there exists some world which contains a counterpart of Quine, and that counterpart is twelve feet tall.

Extreme modal realists use neither modal nor intensional concepts in their theory. Accordingly, they can use possible worlds to analyse non-circularly the concepts of necessity, of counterfactuals, of propositions and of properties. Since the number of different concepts taken as primitive is few, an advantage of this theory is that it is ideologically parsimonious.

Yet for all its strengths, extreme modal realism has few proponents. Although ideologically parsimonious, the theory is as ontologically unparsimonious as possible: for any kind of object there could be, be it a centaur, ghost or unicorn, there is some world which contains such an object. Moreover, the very idea that there is an infinite number of concrete possible worlds, all on an equal footing, simply defies belief. The view that there really are non-actual Centaurs, ghosts and unicorns goes against our strongly held common-sense beliefs.

3 Combinatorialism

The combinatorialist takes possible worlds as recombinations of the fundamental elements of the actual world. For any fundamental property *F* and any atomic object *a*, the combinatorialist maintains that it is possible that *a* instantiate *F*. *Any* collection of such states of affairs counts as a possible world.

The restriction to atomic objects and fundamental properties is needed to rule out impossible recombinations such as an object's being simultaneously both round and square, or red and green. It is a crucial part of the combinatorialist's idea that such a restriction succeed in ruling out all impossibilities. But there are reasons to think it does not. For there may be fundamental properties which are nevertheless mutually exclusive. For example, having a mass of one gram and having a mass of two grams may both be fundamental properties - but nothing can be simultaneously both one gram and two grams.

Not only are there recombinations which are not possible, there are possibilites which are not recombinations. For it is possible that there be things which do not actually exist, and possible that there have been different fundamental properties not instantiated in the actual world. Such possibilities cannot be constructed by recombining only actually existing objects and properties.

4 Possible worlds as novels

On this view, worlds are nothing more than consistent works of fiction which represent different possible states of affairs in the same way novels do. It is possible that grass is red if there is some consistent novel which contains the sentence 'grass is red', or some collection of sentences which entail that grass is red. Since novels can contain names for actually existing objects, any novel containing the sentence 'Quine is twelve feet tall' represents Quine as being twelve feet tall - thus dealing with the problem of transworld identity.

But though this theory neither inflates our ontology nor defies belief (there are few who doubt the existence of novels!), as it stands it simply fails to do justice to the facts of modality. For not any book can count as a possible world. For instance, any novel containing the two sentences 'Grass is red' and 'Grass is green' fails to represent a way in which the world *could* have been. We could avoid this problem by identifying possible worlds with those novels which *could have been true* - but there is a drawback. If the concept of possibility is being *used* in saying what possible worlds are, the concept of possibility cannot be analysed in terms of possible worlds on pain of circularity.

Not only are there novels which do not represent possible worlds, there are some possible worlds which are not represented by any novel. For there are infinitely many different lengths an object could be. Accordingly, there are an infinite number of different possible worlds. Yet there is only a finite number of novels. Moreover, there are merely possible worlds which contain as much complexity and detail as the actual world around us, yet we mortals have no hope of writing a novel describing such a world in such fine detail. Some possible worlds appear to elude our descriptive capabilities.

If we are to have any hope of reducing possible worlds to novels, then our novels cannot be the kinds of things we actually read or write. Instead, our novels must be identified with sets of sentences in some idealized abstract language, a language which, though not capable of being written or spoken, is capable of representing many more possible worlds. One way to implement this idea is to construct a language the terms and predicates of which are actual objects and properties and the sentences of which are set-theoretical constructions thereof. On this scheme,

the ordered pair $\langle F, a \rangle$ is interpreted as saying that *a* is *F*. Possible worlds can then be identified with consistent sets of sentences.

Though such a powerful language enables one to represent an infinite number of different possibilities, it is still a moot point whether *all* the possible worlds can be represented. Moreover, the increase in power comes at a price. For possible worlds are now identified with mathematical objects: sets of ordered n-tuples. Unlike novels, the existence of mathematical objects *is* a contentious issue.

Finally, some fear that this theory does not provide an objective theory of modality. For sentences have the meanings they do in virtue of the way *we* interpret them: had there been no humans, there would have been no meaningful sentences. Accordingly, possible worlds owe their existence to us. This is difficult to square with the view that whether or not something is possible is a matter which is independent of human thoughts and beliefs. ‘Possibly *P*’ cannot be equivalent to ‘There is a possible world in which *P*’ if the former is objectively true but the latter holds only subjectively.

5 Moderate realism

Instead of taking possible worlds as sets of sentences, perhaps possible worlds should be constructed out of the *meanings* of sentences. Perhaps possible worlds should be taken as consistent sets of *propositions*. Obviously, such entities must be understood as existing independently of our own thought and language if worlds are not to owe their existence to us. (Some variants of this theory replace propositions with *states of affairs* or *abstract properties*.)

This theory faces some familiar problems. As above, worlds are abstract. As above, since it is only those sets which *could* have been true which form the possible worlds, the theory cannot analyse possibility without circularity. Of yet greater concern is the fact that this theory takes the notion of proposition as primitive. Admitting such things as a new fundamental kind of object is ontologically costly, and some find the idea that there is an infinite number of abstract representations ‘out there’ every bit as ludicrous as extreme realism. Moreover, the notion of proposition had come under a lot of fire, and one of the more attractive features of possible worlds was that they promised to throw light upon these peculiar creatures. Yet how can this promise be fulfilled by a theory which itself takes this problematic notion as primitive?

Post, Emil Leon (1897-1954)

Emil Post was a pioneer in the theory of computation, which investigates the solution of problems by algorithmic methods. An algorithmic method is a finite set of precisely defined elementary directions for solving a problem in a finite number of steps. More specifically, Post was interested in the existence of algorithmic decision procedures that eventually give a yes or no answer to a problem. For instance, in his dissertation, Post introduced the truth-table method for deciding whether or not a formula of propositional logic is a tautology.

Post developed a notion of 'canonical systems' which was intended to encompass any algorithmic procedure for symbol manipulation. Using this notion, Post partially anticipated, in unpublished work, the results of Gödel, Church and Turing in the 1930s. This showed that many problems in logic and mathematics are algorithmically unsolvable. Post's ideas influenced later research in logic, computer theory, formal language theory and other areas.

1 Life and early work

Emil Leon Post was born in Augustow, Poland. He emigrated with his family in 1904 to New York City, where he lived for the rest of his life. He received a BS from City College in 1917. As a graduate student in mathematics at Columbia University, he studied Whitehead and Russell's *Principia Mathematica* with Cassius J. Keyser. He wrote his dissertation under Keyser's guidance and received his Ph.D. in 1920. He received a postgraduate Proctor Fellowship to Princeton for 1920-1, where he studied with the geometer and postulate theorist Oswald Veblen. To this period can be dated the birth of many of his most important ideas. He taught mostly in New York City high schools until 1935, when he was appointed to the faculty of City College where he remained until his death. During his adult life, Post struggled constantly with manic-depressive illness. To a great extent, this accounts for the incomplete development of many of his ideas. But he also delayed publication while attempting to work out the most general possible results.

In his dissertation (published in 1921) Post carried out one of the first metamathematical studies of a system of logic. This was the propositional logic of *Principia Mathematica*. In addition to proving the completeness, consistency and decidability of this system, he showed that it is complete in a sense that is now called 'Post completeness', that is, the addition to the axiom set of any formula not provable from it produces an inconsistent system. (P. Bernays had proved completeness and consistency in his *Habilitationsschrift* of 1918, but only published these results in 1926.)

Post also showed, going beyond Sheffer (1913), that each truth-function can be defined by a combination of the negation ($\sim$) and disjunction ($\vee$) truth-functions of *Principia Mathematica*. In a later monograph (1941), he showed that a set of truth-functions is truth-functionally complete, as $\{\sim, \vee\}$ is, if and only if for each of five types of truth-function at least one member of the set does not belong to that type (see Pelletier and Martin 1990). At the end of his dissertation, Post also showed how to develop an *m*-valued propositional logic, as opposed to the traditional logic with its two values of True and False (see Many-valued logics).

2 Canonical systems

In his year as a Proctor Fellow at Princeton (1920-1), Post's main research was into 'generated sets' of strings on a finite alphabet, that is, inductively defined classes of strings. Post studied three categories of such 'canonical systems'. The systems he labelled 'canonical system *C*' are now known as 'Post production systems'. This laid the foundations for the field that is now called the theory of formal languages (see Formal languages and systems). Each canonical system specifies a class of rule sets. These rule sets define languages, conceived as infinite sets of finite strings of characters on a finite alphabet. This approach is analogous to the specification of the class of recursive functions as those which result from a finite number of applications of a certain base group of number-theoretic functions. What is commonly called 'Church's thesis' is the proposition that the number-theoretic functions which can be computed by any means at all are exactly the ones that are the recursive functions. The converse is obvious (see Church's thesis). Analogously, we can say that Post's thesis is that any finitely specifiable language is generated by the rules of some canonical system. He showed that any set of strings that can be generated using one of his canonical systems can be generated in either of the other two systems. Post

was able to show that a decision procedure for his canonical systems furnishes a decision procedure for the first-order logic of *Principia Mathematica*. He sketched, but did not complete, a proof of the converse. This led him to conjecture that Hilbert's *Entscheidungsproblem*, that is, the decision problem for first-order logic, is unsolvable. This was more than ten years before Church's proof (1936) of its unsolvability (see Church's theorem and the decision problem).

3 Recursion theory

Post's canonical systems were later shown to be equivalent to other formulations of the class of computable procedures, such as lambda-definability, recursive functions and Turing machines. Using this equivalence, a set of formulas is called 'recursive' if there is a decision procedure for the set using any of the methods. It is called 'recursively enumerable' if there is a procedure using any of these methods which successively lists the elements of the set. Post's 'Recursively Enumerable Sets of Positive Integers and Their Decision Problems' (1944) is foundational for modern recursion theory. It was there that he first articulated the 'fundamental theorem' of recursion theory; that a set is recursive if and only if both the set and its complement are recursively enumerable.

In this paper, Post also shows that there is a recursively enumerable but undecidable set of positive integers for which the decision problem has the highest 'degree of unsolvability'. If there were a decision procedure for a set of this degree, there would also be a decision procedure for any other undecidable set. Post states the question, known as Post's Problem, of whether there are recursively enumerable but undecidable sets of positive integers which have lower than this maximum degree of unsolvability. The existence of sets of such lower degrees was shown independently in Muchnik (1956) and Friedberg (1957).

4 Other work

Post's methods gained the attention of mathematicians when he showed (1947) that there is no algorithmic method for solving the 'word problem of Thue' which dated from 1914. In this paper, he used the Turing machine formulation of computability. In the course of doing so, he provided a critique of details of Turing's paper. This is not surprising, since in 1936 he had independently formulated a notion of computation very much like that of Turing (see Turing machines).

In a diary entry Post wrote, 'I study Mathematics as a product of the human mind and not as absolute'. He believed that he was investigating a natural boundary between what he called the 'productive' and the 'creative' capacities of the human mind. For Post, the incompleteness of logical systems of proof showed that 'The logical process is essentially creative', that is, that the human capacity to know is not reducible to a system (see Appendix to Post 1965).

Postcolonial philosophy of science

Are there laws of nature that today's modern sciences are ill-designed to discover? Does the universal use of these modern sciences require their value-neutrality, or are their social values and interests an important cause of their universality? What resources for scientific knowledge can other cultures' science projects provide?

Such questions are raised by recent postcolonial global histories that focus analyses on the role of European expansion in the advance of modern science and in the decline of other cultures' science traditions. These accounts challenge philosophers to re-evaluate unsuspected strengths in other scientific traditions and identify modern science's borrowings from them. They also identify European cultural features that have, for better and worse, constituted modern sciences and their representations of nature and thus seek to develop more realistic and useful accounts of the values, interests, methods, universality, objectivity and rationality of science.

1 European values and interests of modern science

Since the 1960s, it has been clear that social values and interests do and must shape the fabric of scientific cultures, their practices and knowledge claims. The great explanatory power of science turns out to have been expanded by historically distinctive values and interests. By the 1980s, the widespread dissemination of postcolonial histories - ones that report the continual exchanges and interminglings between cultures 'from the beginning' - led to accounts of how different cultures' sciences advance and then decline within such global relations. One main focus has been on the cognitive effects on modern sciences of the two-way causal relations between European expansion and the development of modern sciences in Europe, and a second on the benefits of nourishing cultural diversity in the resources brought to explaining nature's regularities. Selin (1997) is a valuable resource for this second project.

Joseph Needham's comparative studies of Chinese and European sciences were an important precursor to the new postcolonial science studies (1969). From such a perspective, he argued that European sciences were indeed superior at explanation, but not for every valuable scientific project, or always for the reasons that historians and philosophers assumed. Moreover, some of their successes, not just their failures, were due to their cultural values and interests. For example, Christian values and interests shaped the conception of 'laws of nature', though Christian belief in the heavenly crystal spheres blocked the development of astronomy. Thus religious beliefs had both positive and negative effects on the growth of scientific knowledge.

Attempting to steer a more effective path than Needham did between the older internalist and externalist histories of science, the comparative science studies of Needham's intellectual heirs try to show how modern science's representations of nature are not culturally neutral: they make the European presuppositions characteristic of their societies. For example, what we know about nature is restricted largely to what the sponsors of modern science have wanted to know. This information is embedded in models, metaphors and narratives for nature's processes that they found culturally and politically congenial. It also both enriched and limited what could be detected by the culture's distinctive ways of organizing scientific work.

Thus scholars such as Blaut, Goonatilake, Hess, McClellan and many of the contributors to Petitjean *et al.* (1992) and Harding (1993) argue that the modern sciences have produced accounts mainly of those aspects of nature that permitted upper and rising classes of Europeans to multiply and thrive, especially through the advance of their military and other expansionist projects. Scientists answered questions about how to improve European land and sea travel, to identify economically useful resources in the colonies, to mine gold, silver and other ores, to manufacture and farm for the benefit of Europeans living in Europe, the Americas, Africa and Asia, to improve their health and occasionally that of the workers who produced profit for them, and to defend the Europeans against their enemies. Expansion turned the world into a laboratory for the sciences in Europe. Nature remains *for* those who own it and have the means of extracting its resources, they argue. Such sciences have not been designed to explain such things as how to preserve fragile environments and scarce resources.

Moreover, it is argued that even if modern sciences bore no such cultural fingerprints, their commitment to value-neutrality would itself mark them as culturally distinctive. Most cultures value not neutrality but their own values and interests and as such are culturally identifiable. Surprisingly, it turns out that abstractness and formality

express distinctive cultural features, not the absence of any culture at all. Of course the cultural specificity of the neutrality ideal does not mark abstractness or formality as a defect, since most values and interests have the potential to enable us to ‘see’ nature in new ways. Instead, it raises questions about the conditions under which a commitment to neutrality advances the growth of knowledge.

2 Universality, objectivity, methods, rationality

Modern sciences are practised and admired around the world. Scientists come from every race, gender, class and culture, and the sciences’ formal languages permit communication (and agreement) between all. Moreover, the laws of nature that modern science articulates predict how nature’s forces will act on people indiscriminately, regardless of race, class, gender and culture. But such facts only support a weak claim to modern sciences’ universality. The familiar ‘strong universality’ thesis argues that the uniqueness of the universality of scientific claims (the ‘fact’ that no other scientific traditions have produced universal claims) is the consequence of an internal, epistemological condition: methods that eliminate cultural fingerprints from scientific representations of nature’s events and processes.

This uniqueness claim is challenged by postcolonial histories that show how the great explanatory power and appeal of modern sciences has been established in part as an empirical consequence of European expansion. Such accounts drive a wedge between the achievement of universality and the requirement of cultural neutrality. They suggest that other, culturally different, sciences could also generate empirically adequate laws of nature, ones that would be consistent with much of the evidence supporting the modern sciences’ representations of nature. They argue that modern sciences are not necessarily the best for discovering all of the laws of nature; they have intrinsic metaphysical and epistemological limitations for, like all others, they are shaped by the cultural interests they represent, by local discursive resources, and by culturally-preferred forms of scientific work. They question that the sciences and technologies that have worked best to advance some groups in the Northern hemisphere will work best to advance the rest of the world’s peoples, or, for that matter, to continue to sustain Northern elites.

Challenges to conventional conceptions of objectivity, method and rationality are also generated by these accounts - ones similar to those raised by gender theorists (see Gender and science; Feminist epistemology). Is the neutrality ideal that is so central to such concepts an obstacle to detecting the kinds of culture-wide values and interests in European sciences that are reported in the comparative studies? The postcolonial accounts started off thinking about modern sciences from the lives of people in cultures that have been disadvantaged by them. Are standpoint epistemologies thus required to explain the emergence of the postcolonial accounts in the first place, and to generate research methods capable of continuing to produce such more comprehensive and less distorted accounts? Should assessments of the rationality of modern sciences continue to be restricted to examining their technical, cognitive cores now that these are understood to be no longer separable from the cultural values and interests that permeate them?

Postcolonial science studies, emerging from both Northern and Southern science scholars, are part of the long tradition of criticism that has enabled the growth of knowledge. They challenge philosophers to consider an updated version of Thomas Kuhn’s famous question: should not single-stream histories of science be a source of phenomena to which theories of knowledge may legitimately be asked to apply?

Postcolonialism

The term 'postcolonialism' is sometimes spelled with a hyphen - post-colonial - and sometimes without. There is no strict general practice, but the hyphenated version is often used to refer to the condition of life after the end of colonialism while the non-hyphenated version denotes the theory that attempts to make sense of this condition. The term is regularly used to denote both colonialism and imperialism even though these refer to different historical realities.

Like postmodernism and poststructuralism, postcolonialism designates a critical practice that is highly eclectic and difficult to define. It involves a studied engagement with the experience of colonialism and its past and present effects at the levels of material culture and of representation. Postcolonialism often involves the discussion of experiences such as those of slavery, migration, suppression and resistance, difference, race, gender, place and analysis of the responses to the discourses of imperial Europe, such as history, philosophy, anthropology and linguistics. Since conditions under imperialism and colonialism proper are as much the subject of postcolonialism as those coming after the historical end of colonialism, postcolonialism allows for a wide range of applications and a constant interplay between the sense of a historical transition, a cultural location and an epochal condition. Postcolonialism is seen to pertain as much to conditions of existence in former colonies as to conditions in diaspora. Both are frequently linked to the continuing power and authority of the West in the global political, economic and symbolic spheres and the ways in which resistance to, appropriation of and negotiation with the West's order are prosecuted. However the term is construed, there is as much focus on the discourse and ideology of colonialism as on the material effects of colonial subjugation. Because it has its source in past and continuing oppression, postcolonialism furthermore has affinities with multicultural, feminist, and gay and lesbian studies.

1 Seminal works

It is generally agreed that the single most influential work to define the purview of the term was Edward W. Said's *Orientalism* published in 1978. Drawing on the work of Michel Foucault, Said's main thesis was that the Western academic discipline of Orientalism was strictly speaking a means by which the Orient was produced as a figment of the Western imagination for consumption in the West and also as a means of subserving the ultimate project of imperial domination. Said's main ideas have been both criticized and extrapolated across various disciplines, and it is mainly thanks to his book that what is known as colonial discourse analysis gained coherence. Among studies inspired by his work have been those by Gauri Viswanathan (1990), looking at the introduction of the paradigm of English studies in India and the degree to which it attempted to shape local attitudes to Empire; Patrick Brantlinger (1988), which looks at the forms of imperial ideology as perceivable in the literary writings of the period 1830-1914; Martin Bernal (1987; 1991), which through a careful analysis of the sources of Greek civilization sought to show not only that this was heavily indebted to the influence of a black Egyptian civilization, but also the degree to which the discipline of classical studies in the eighteenth century attempted to obscure this contribution in the dominant disciplinary paradigms that were in use; and Valentin Mudimbe (1988) which showed that the notion of African systems of knowledge had always been governed by a Western form of knowledge.

Another text which is thought to be seminal in the field of postcolonial studies is by Bill Ashcroft *et al*., *The Empire Writes Back* (1989). This book was in many senses responsible for popularizing the term post-colonialism in literary studies, even though, as has been pointed out by Aijaz Ahmad (1995) among others, the term was first used by political scientists in the early 1970s to denote the condition of Third World political systems after decolonization. Before its publication much of what is described under the label of postcolonialism in literary studies was discussed under the rubric of contending terms such as 'New Literatures in English', 'International Literatures', 'Third World Literature' or 'Commonwealth Literature'. However, it was the notion of Commonwealth Literature that *The Empire Writes Back* was most intent on displacing. The writers of the book were of the view that the term showed too close and uncomfortable a relationship to metropolitan Britain, and the term 'post-colonial' was seen as a means of transcending this relationship. Another influential thesis they advanced was that the literature coming out of former colonies had the express purpose of 'writing back' to the empire, and by a variety of textual strategies, of subverting the dominant categories of representation that had circulated from the imperial centre. In this impulse they sought to correct something for which Said's book had been heavily criticized, namely his complete silence on the voices of resistance and/or complicity that could easily

be shown to have entered into a variety of relationships with Orientalist discourse. A third thesis of *The Empire Writes Back* was that postcolonial writing was also seriously contesting the domination of the English language by creating a variety of creolized and hybridized versions of the language. As a means of attending to this phenomenon, the authors proposed the term 'english' to designate this phenomenon; and even though their proposal for the use of this particular term was not readily taken up by other commentators on postcolonial writing, it is evident that the general note of resistance in their critical practice was taken up in numerous articles published in literary journals devoted to the field such as the *Journal of Commonwealth Literature*, *Callaloo*, *Wasafiri*, *Kunapipi* and *World Literature Written in English*, among others.

2 Problems with the term 'postcolonialism'

To gain a sense of the nature of some of the criticisms levelled against the term 'postcolonial', it is important to return to the question of its genesis. Though earlier it was noted it could be traced to the seminal publications of Said and Ashcroft *et al*., such a perspective may obscure the complex and somewhat composite genealogy of the theoretical practices denoted by the term. These can fruitfully be linked to what one critic has noted as the 'wide-ranging retrospect taken in the 1980s on the exclusionary forms of reason and universality composed by a Western modernity complicit with imperial expansion and colonialist rule' (Parry 1997: 4). This major retrospective glance was itself filiated to the broader criticisms of Western philosophy formulated by Jacques Derrida and the subject of wide discussion in Western universities since the early 1970s. In this regard, the work of Michel Foucault, as it described the discursive constitution of objects of knowledge in their insertion into hierarchies of power also proved influential and decisive. Behind all this, as has been noted by Sherry Ortner (1984), was the emergence of a linguistic paradigm in the humanities and social sciences from the 1960s onwards. But most directly significant for postcolonialism was the gradual and increasingly important research done in the areas of feminist, multicultural, minority and gay and lesbian studies. The impulse they shared in common with postcolonial studies was the desire to contest the centrality and authority of distinctive systems of domination, together contributing to the deciphering of systems of representation designed to validate institutional subordination and silence the voice of competitors. Quite often, work of a thorough, interdisciplinary nature was pursued, such as that by Gayatri Spivak (1996) in her linking of Marxism, feminism and eclectic cultural criticism.

One of the key debates in postcolonialism is to what extent the term can be used to designate studies undertaken in a variety of different disciplines. Thus, postcolonialism is seen by some of its practitioners as the paradigmatic anti-hegemonic theoretical orientation, with colonialism taken to be the archetypal and most brutal expression of hegemony; any theoretical tendency that sees itself as anti-hegemonic is then easily taken to be affiliated to postcolonialism. For others, however, it is its productive circularity that calls the postcolonial object of study into being, while allowing unreflexive notions of nationhood, race and identity, and even of colonialism itself, to be deployed without attention to the specificities of each discipline.

Another debate relates to the unresolved temporal transcendence signalled in the first part of the word, when in fact there is evidence everywhere that colonialism has not been fully transcended. For Anne McClintock (1992) the central flaw in the term lies in its implicit links with Enlightenment notions of progress, since the 'post' marks nothing but the march of history without really attending to the difficulties involved in such an implicit filiation to Enlightenment notions of progress. Other terms such as 'neo-colonialism' are thought to succeed better in capturing the sense of the continuing but disguised influence of the imperial metropolis, especially as the latter is refracted through different forms of globalism in the control of the financial and primary-produce markets and in the dominant modes of information gathering and dissemination more generally. In spite of these criticisms, however, the term continues to be used widely, partly because there seems to be no clear rival to mark the distinctive field, and partly also because, as Kwame Anthony Appiah (1994: 240) puts it, the term is seen as an important 'space clearing gesture'. What is more important, perhaps, is to note that postcolonialism is symptomatic of the perception of continuing injustice in the global political economy, the victims of which are seen to be formerly colonized people as well as their diasporic descendants.

3 Colonial discourse analysis and the question of historiography

One of the areas that Said's work greatly inspired was the re-visiting of the era of colonialism in order to explore the links between knowledge and power. An important extension of his work, however, took the direction of

showing that the colonial encounter affected both colonizer and colonized simultaneously, and that the formation of the colonizer's culture was heavily dependent upon the colonial encounter. The notion of an encounter between monolithic and radically opposed entities in history gave way to studies emphasizing the unstable nature of identity formation that affected both parties.

A major inflection of this kind of work has been the emphasis on a psychoanalysis of the colonial encounter and its effects. This view is most strongly associated with Homi Bhabha, whose *The Location of Culture* (1994) brings together a decade of essays devoted to this subject. This tendency was not really new in studies of colonialism. Notable studies psychoanalysing imperialism and colonialism had already been done for India by Ashis Nandy (1983) and for Africa by Franz Fanon (1952, 1961). The work of these writers was thought to be highly stimulating and to allow for very significant extrapolations to other geographical areas of the colonial encounter. Bhabha's main difference was in maintaining that resistance could be detected in the interstices of the unstable symbolic and discursive encounters between colonizer and colonized, and that the symbolic practices also revealed the unstable nature of colonial identity.

The nature of Bhabha's formulations is thought to have important implications for the study of colonialism. Of particular significance is the privileging of discourse in accounts of the colonial encounter and of resistance against it. Not only is this seen by mainstream historians as highly problematic in its avoidance of an engagement with the real and brutal processes of colonialism, it is also thought to privilege the reading practices of the critic themselves without paying adequate attention to the specific contours of relevant historical documents. Colonial discourse analysis may be said to have additional implications for the methodology of historical research and its writing. Notably, it regularly privileges metaphors and literary tropes and focuses on them as being of interpretive value in coming to terms with history. Furthermore, such metaphors and tropes are also seen to be determinate of historical process and are taken to be succinct expressions of the main qualities of colonial ideology. This intense focus on literary figures then allows for a different historiographic practice from that practised by traditional historians; there is less attention to the broad range of archival materials such as journals, diaries, official reports and the like; less atention to the comparative analysis of such documents in the attempt to arrive at a hierarchy of their value as evidence; and much more attention to the enunciatory modalities of different literary tropes and their manifestation in different historical documents. The apparently a-historical nature of such forms of analyses has frequently been pointed out by historians; but it is also evident that there is a readiness on the part of some to attempt a fusion of the two forms of historical enquiry, in the hope that the strengths of both can be drawn upon for a fuller understanding of colonialism.

A less contentious new historiographic practice is that applied from the early 1980s by members of the Subaltern Studies group in India. Taking as their main point of disagreement the dominant Orientalist, nationalist and Marxist historiographies that had dominated historical accounts of India, they sought to challenge these and, in their place, to produce a 'history from below', that would attend to the processes of the formation of a critical consciousness within the Indian peasantry during the height of colonialism and its aftermath. The Subaltern Studies project drew inspiration from the work of Antonio Gramsci, especially from his concept of hegemony and the place of the subaltern in the formation of national consciousness. Despite producing a wide-ranging number of studies, the Subaltern Studies project could not be said to have formed a 'school' as such. None the less, it represents the most coherent attempt in postcolonial studies to seize the practice of writing history for the purpose of producing knowledge about people who had hitherto been absent from such history.

4 Diaspora, hybridity and identity

The question of diasporas is also an important dimension of postcolonial studies. What is generally taken to be the high point of modern imperialism took off from about 1830, and has fruitfully been related to the formation of a new world order after the abolition of slavery. Slavery itself had ensured that large numbers of Africans had been moved to the West Indies and America to work on plantations and to sustain the global industrial economy of the period. Indian indentured labour also featured prominently in this mass movement of peoples across various geographical locations.

That first phase of diaspora, marked mainly by slavery, was later succeeded by another, less coherent, phase. This second phase was especially pronounced from about the end of the decolonization period in the 1960s, when for various economic and other reasons a large number of Asians and Africans moved to Europe and America. The

different phases of migration produced different relationships both to the countries of origin and to those of eventual sojourn. What is most significant, however, is that as generations of migrants settled in the West, an active diaspora consciousness began to be formed. Literature written by migrants is now an increasingly important part of postcolonial studies. Additionally, there have been serious attempts to discuss the complexities of cross-cultural existence and the ways in which this affects the individual psyche as well as the culture of the adopted country of residence. And in the United States, because the migrants who went there joined an already existing and active black population, the discussion of diaspora had to take account of a variety of often complex issues to do with identity.

Many of these issues have been steadily formulated by African-Americans themselves from as far back as the slavery period. W.E.B. Du Bois, author of *The Souls of Black Folk* (1903), formulates the notion of the split consciousness of black peoples, who continually have to see themselves in terms of the idea of an indigenous folk as well as in relation to their perception by the dominant categories of white America. And in a lecture series published as *Playing in the Dark* (1992), Toni Morrison revisits similar issues and asks what happens to the imagination of black authors who are conscious at some level of having to represent their own race to a race of readers that has always understood itself as universal, and has continually written minority races out of the account. The theme of identity formation for minority races has many resonances with Franz Fanon's ideas about the psychology of Africans under the brutal conditions imposed by French colonialism in Algeria. For others, the issue of identity in diaspora is seen more in the light of notions of hybridity, in which it is thought that the diasporic individual marries ideas from both country of origin and that of sojourn. The issues are vastly complicated as they are traced through different generations, and there are some who oppose the idea of hybridity, noting that it depends too much for its success on a concept of freedom which is ultimately class based. If postcolonialism seems to be a variable and problematic concept, to many its continuing use is sanctioned by the fact that there is no clear alternative that is able to speak to the complexities of modern existence while simultaneously taking account of the historic configuration of colonialism in a cross-disciplinary and fertile way.

(1990) *White Mythologies: Writing History and the West*, London: Routledge.(Last three chapters offer stimulating discussion of the work of Edward Said, Homi Bhabha and Gayatri Spivak; significant for dealing with the question of the ideological implications of history writing in the West.)

Postmodern theology

The term 'postmodernism' is loosely used to designate a wide variety of cultural phenomena from architecture through literature and literary theory to philosophy. The immediate background of philosophical postmodernism is the French structuralism of Saussure, Lévi-Strauss, Lacan and Barthes. But like existentialism, it has roots that go back to the critique by Kierkegaard and Nietzsche of certain strong knowledge claims in the work of Plato, Descartes and Hegel. If the quest for absolute knowledge is the quest for meanings that are completely clear and for truths that are completely certain, and philosophy takes this quest as its essential goal, then postmodernism replaces Nietzsche's announcement of the death of God with an announcement of the end of philosophy.

This need not be construed as the death of God in a different vocabulary. The question of postmodern theology is the question of the nature of a discourse about deity that would not be tied to the metaphysical assumptions postmodern philosophy finds untenable. One candidate is the negative theology tradition of Pseudo-Dionysius and Meister Eckhart. It combines a vigorous denial of absolute knowledge with a theological import that goes beyond the critical negations of postmodern philosophy. A second possibility, the a/theology of Mark C. Taylor, seeks to find religious meaning beyond the simple opposition of theism and atheism, but without taking the mystical turn. Finally, Jean-Luc Marion seeks to free theological discourse from the horizon of all philosophical theories of being, including Heidegger's own postmodern analysis of being.

1 Key themes in postmodern philosophy

The themes of philosophical postmodernism whose bearing on philosophical theology is most direct are Heidegger's 'destruction' of the history of ontology and Derrida's 'deconstruction' of the metaphysics of presence. Heidegger's destruction, originally announced in *Being and Time* (1927), becomes a critique of 'the onto-theo-logical constitution of metaphysics' in *Identity and Difference* (1957). His point of reference is Aristotle's attempt to unify being, which is said in many ways. At the categorial level, it is substance that plays the role of unifying first principle for all the *pros hen* equivocals. But how is the world of actual substances itself to be unified? By a highest substance, God, who is universal by being first. In other words, the whole realm of beings can only be understood fully with reference to the highest being by whom their being is ordered (see Heidegger, M. §6).

Heidegger calls this confluence of the universality of ontology with the primacy of theology 'onto-theo-logy'. In a typically postmodern gesture, he treats this honoured principle, whose modern fulfilment he finds in Hegel, with undisguised disrespect. He remarks that in onto-theo-logy 'the deity can come into philosophy only insofar as philosophy, of its own accord and by its own nature, requires and determines that and how the deity enters into it' ([1957] 1969: 56). In other words, a tradition that stretches at least from Aristotle to Hegel uses God as a means to its own ends; anticipating the spirit of modern technology, it views even God as a resource in the service of its own will to power, the totalizing project of rendering the whole of being intelligible to human understanding. In transgressing this tradition, Heidegger invokes both a hermeneutics of finitude, which views such a project as hubris, and a hermeneutics of suspicion, which looks for hidden and disreputable motives beneath discourses generously decorated with piety.

Heidegger insists that his critique, so far from having its origin in atheism, can be seen as a form of religious protest. Echoing Pascal, he says of the god of philosophy as onto-theo-logy:

> Man can neither pray nor sacrifice to this god. Before the *causa sui* man can neither fall to his knees in awe nor can he play music and dance before this god.
>
> The god-less thinking which must abandon the god of philosophy, god as *causa sui*, is thus perhaps closer to the divine God. Here this means only: god-less thinking is more open to Him than onto-theo-logic would like to admit.
>
> (Heidegger [1957] 1969: 72)

Heidegger develops this critique explicitly against the Hegelian holism that would attain absolute knowledge by developing an all-inclusive categorial scheme, the Logic, and an all-inclusive theory of actual beings, the Philosophies of Nature and of Spirit. Derrida has his own critique of Hegel, but in this context the deconstruction

of the metaphysics of presence is best viewed as an assault on Cartesian foundationalism and its claim that, in a piecemeal manner and at the outset, we can achieve unambiguous meanings and final truths. It is just such meanings and truths that Derrida designates as presence, though the term ‘immediacy’ signifies much the same thing (see Derrida, J.).

What is present is both here and now, and Derrida’s notion of presence has both spatial and temporal ramifications. To be fully present to the meanings and truths necessary for even piecemeal absolute knowledge is to have found the transcendental signified, a meaning or a truth so self-contained as to require no reference to anything outside itself in semantic space and so finished as to require no reference to any clarification or validation subsequent to this moment in time. Deconstruction is not so much the assertion that we never reach the transcendental signified as it is the continuous showing of the spatial differences and temporal deferrals that undermine claims of total clarity and final certainty.

Derrida (1968) invents the term *différance* to stand for this union of difference and deferral in the critique of logocentrism, which can be defined as the claim that absolute knowledge is possible, that either prior to all linguistic mediation (as in the work of Husserl) or subsequent to the essential completion of that mediation (as in the work of Hegel), human thought stands face to face with being. The spatial part of the argument derives largely from structuralism, while the temporal part is derived from Husserl’s phenomenology of internal time consciousness for use, in typically *ad hominem* fashion, against Husserlian foundationalist claims of apodictic intuition.

For Heidegger and Derrida, as for Kierkegaard and Nietzsche, it is the temporal structure of human existence above all else that renders the transcendental signified a transcendental illusion for human thought. In this respect they are all Kantians, for whom it is foolish to claim the finality of eternity for human thought.

2 Postmodern theology as negative theology

The question of a postmodern theology that emerges is quite clear: what would a discourse look like that would still be theological but would vigilantly resist lapsing into metaphysics, which in this context signifies the confluence of onto-theo-logy, the metaphysics of presence, and logocentrism? Since Heidegger and Derrida are in agreement that we cannot just decide to leave metaphysics behind and be done with it, such a postmetaphysical theology will not be the triumphant freedom from all metaphysical tendencies, but the militant struggle against enslavement to them. Partly because of the mystical element in Heidegger’s thought, and partly because the negative character of Derridean deconstruction has from the outset suggested affinities with negative theology, the tradition of mystical theology that has Pseudo-Dionysius and Meister Eckhart among its leading figures is easily viewed as a paradigm of postmetaphysical theology.

Derrida’s answer to the question whether deconstruction is a kind of negative theology is an emphatic negative. Negative theology for Dionysius and Eckhart is part of the *via negativa*; it is a scepticism in the service of mysticism. In so far as deconstruction can be construed as a kind of scepticism, it serves no mystical project. It does not posit a ‘superessential’ deity, a God beyond being; it knows no nostalgia or hope for a pre- or postconceptual experience of pure presence to such a deity; and it does not address such a deity in the second person language (‘you’ or ‘thou’) of prayer or praise. Moreover, the mystical project, like its cousin, the logocentric project of Hegel, is committed to an overcoming of difference that betrays an allergic reaction to the very experience of otherness that deconstruction seeks to preserve.

Kevin Hart (1989) believes Derrida is right to reject the suggestion that deconstruction is a kind of negative theology. But he argues that negative theology is a deconstruction of positive theology, and in this way the paradigm of postmetaphysical theology. He agrees with Heidegger and Derrida that what the former calls the ‘step back’ out of metaphysics is an ongoing task. This means that negative theology will always be accompanied by positive theology, as it is in Dionysius and Eckhart.

But they have a distinctive account of the relationship between the two. For someone like Thomas Aquinas, positive theology is prior and negative theology is a supplemental check to see that our discourse is about God and not just our ideas of God. For Dionysius and Eckhart, negative theology is prior to all the statements of positive theology. At issue here is not the order of exposition, as if the question were what should go into Chapter One. The issue is whether the negative principle, the denial that our concepts could possibly be adequate to the divine

reality, is the first principle of theology.

3 Postmodern theology in a Nietzschean mode

The ‘postmodern a/theology’ of Mark C. Taylor is not a negative theology of the sort just described. Like Derridean deconstruction, a major source of its inspiration, it lacks the nostalgia and hope that mysticism shares with the positive theologies of theism. It has a strong Nietzschean bent and describes deconstruction as the hermeneutics of the death of God. But it describes itself as between belief and unbelief, because its response to Nietzsche’s announcement is neither the joyous, atheistic acceptance of God’s demise nor the angry or frightened, theistic rejection of it. This is not because it is indifferent to religious meaning, but because it finds both the simple affirmation and the simple denial of God’s reality to be too deeply enmeshed in the metaphysical thinking from which postmodernism seeks to extricate itself.

Taylor begins his a/theology (1984) with a deconstructive critique of four concepts that have been central to Judaic and Christian religion: God, self, history and book. In relation to tradition, this is an anti-theological gesture, but it purports to be of religious significance by opening up new possibilities for religious imagination. The positive rethinking of the four deconstructed themes is not described as reconstruction but as nomad thought in order to signify that it neither has nor seeks any fixed points of reference. Life is wandering and erring, and thus a maze; but this a/theology seeks for signs of ‘mazing grace’, as Taylor puts it.

The path from Nietzsche to Derrida leads all but inevitably through Heidegger. So it is not surprising to find an important Heideggerian theme in Taylor’s project, namely the attempt to find a mode of thought that is not enslaved to projects of mastery, control and domination. The task of a/theology is neither to get a handle on God, nor to find in God the key to our mastery of the world.

4 Postmodern theology in a Kierkegaardian mode

The postmetaphysical theology of Jean-Luc Marion owes no special debt to Kierkegaard; but it is written in a Kierkegaardian mode in the sense that it combines an uncompromising critique of the mainstream metaphysical traditions of the West with the desire to return to biblical religion. It points towards a dehellenized Christianity for those who still find themselves, or would like to find themselves, in the Church.

Marion (1982) stresses that the critique of metaphysics as onto-theo-logy is the critique of a certain kind of discourse. It does not entail either God’s unreality or the absence of a divine character that is God’s own, independent of our images and concepts of God. Its purpose is not to make the world safe for secularism, but to open the space for a new experience of God as love and as gift.

However, this space is to be found beyond the horizon of Being, and the Heideggerian notion that a critique of theology can represent a new openness to God is immediately supplemented with a critique of Heidegger. Marion affirms his identification of onto-theo-logy as the arrogant demand by philosophy that God enter its discourse on its terms and in its service. At least as strongly as Heidegger, he wants to free God from these constraints. But he insists that the ‘step back’ out of metaphysics is not a step back into Being. In other words, Heidegger’s attempt to think Being is more nearly a continuation of the onto-theo-logical constitution of metaphysics than a decisive break with it. The move away from the Athens of Plato and Aristotle needs to be in the direction of the biblical Jerusalem rather than the pre-Socratic Magna Graecia.

The major premise of Marion’s argument is the distinction between an idol and an icon. It concerns the ‘how’ rather than the ‘what’ of perception, which means that one and the same object could be an idol for one observer and an icon for another. An object of religious significance is an idol when it satisfies our perception, fulfils our intentions, freezes our gaze and brings it to rest. We have arrived and need not go further. An object is an icon when our gaze finds it necessary to ‘transpierce’ it in search of what exceeds it, when the invisible remains invisible in its visibility, when what is presented opens an abyss that we can never finish probing. While the idol limits the divine to the measure of the human gaze, the icon signifies an openness to that which exceeds every human measure. This analysis can be transferred from the sensible to the intelligible realm. Concepts, too, can serve as idols, not by virtue of their content (their ‘what’) but by virtue of their use (their ‘how’). Any theology that professes an adequation between its concepts and the divine reality is *ipso facto* idolatrous; this is the fatal flaw of onto-theo-logy.

Heidegger's thinking of Being breaks decisively with the Hegelian-Husserlian drive towards adequate concepts. But by making the human understanding of Being the horizon for any understanding of God, Heidegger also compels the divine to conform to the measure of human thought. After *Being and Time*, he understood the goal of philosophy to be to let things show themselves in and from themselves. Marion argues that the horizon of Being undermines this goal. The self-revelation of God as love and as gift shatters this and every horizon, for love and gift do not signify concepts that would be adequate to the divine reality and with which we might rest, but the excess of the divine reality to every attempt on our part to think it. For Marion, postmodern theology is the attempt to preserve this self-revelation from every philosophical theory of Being, modern or postmodern.

Postmodernism

The term 'postmodernism' appears in a range of contexts, from academic essays to clothing advertisements in the New York Times. Its meaning differs with context to such an extent that it seems to function like Lévi-Strauss' 'floating signifier'(Derrida 1982: 290): not so much to express a value as to hold open a space for that which exceeds expression. This broad capacity of the term 'postmodernism' testifies to the scope of the cultural changes it attempts to compass.

Across a wide range of cultural activity there has been a sustained and multivalent challenge to various founding assumptions of Western European culture since at least the fifteenth century and in some cases since the fifth century BC: assumptions about structure and identity, about transcendence and particularity, about the nature of time and space. From physics to philosophy, from politics to art, the description of the world has changed in ways that upset some basic beliefs of modernity. For example, phenomenology seeks to collapse the dualistic distinction between subject and object; relativity physics shifts descriptive emphasis from reality to measurement; the arts move away from realism; and consensus politics confronts totalitarianism and genocide. These and related cultural events belong to seismic changes in the way we register the world and communicate with each other.

To grasp what is at stake in postmodernism it is necessary to think historically and broadly, in the kind of complex terms that inevitably involve multidisciplinary effort. This multilingual impetus, this bringing together of methods and ideas long segregated both in academic disciplines and in practical life, particularly characterizes postmodernism and largely accounts for such resistance as it generates.

Although diverse and eclectic, postmodernism can be recognized by two key assumptions. First, the assumption that there is no common denominator - in 'nature' or 'truth' or 'God' or 'the future' - that guarantees either the One-ness of the world or the possibility of neutral or objective thought. Second, the assumption that all human systems operate like language, being self-reflexive rather than referential systems - systems of differential function which are powerful but finite, and which construct and maintain meaning and value.

1 Historical context

'Postmodernism' is a historical term, indicating something that comes after modernity; so the definition of postmodernism varies depending on what is meant by 'modern'. When 'modern' refers to movements in the arts around the turn of the twentieth century - an efflorescence known as 'modernism' - then 'postmodern' refers to a fairly local phenomenon of the mid- to late-twentieth century (see Modernism). But when 'modern' is used in the historian's sense, to indicate what follows the medieval - that is, Renaissance culture and its sequels - then 'postmodern' refers to a more broadly distributed cultural phenomenon in European and US societies.

Given this latter use of the term 'modern', *post*modernism is what follows and transforms that particular Renaissance (some would prefer to call it Enlightenment) modernity. It is in this broader sense of modernity that the term 'postmodernism' takes on its full meaning. Here it signals a revisionary shift in the system of values and practices that have been broadly codified in European life over several centuries. Confusion between these two historical meanings of the term 'modern' skews discussion of the crucial philosophical, political and social issues at stake in postmodernism.

Such confusion certainly is not relieved by the ahistorical contributions of recent French philosophy which has taken the demystification of Western metaphysics back to Plato. Known as post-structuralism, this philosophy has been crucial to theoretical discussion of postmodernism, but not identical with it; the historical horizon of post-structuralism occupies a period so vast that it practically ceases to allow for history at all, producing discussions that blot out awareness of postmodernity as a historical event. Luce Irigaray and Jacques Derrida, for example, take on the foundations of Western philosophy and do not limit their critiques specifically to modern European culture (see Post-structuralism).

Modernity, defined from the vantage point of post-modernity, was a cultural epoch and 'episteme' (see §2) founded in a humanistic belief that the world is One. This belief, codified in centuries of realist art, representational politics and empirical science, is tantamount to the assertion that a common denominator can be found for all systems of belief and value: that the world is a unified field, explicable by a single explanatory

system. As this belief developed through increasingly secular and materialistic practices it became less secure in its claims to universal applicability. After the Renaissance the ‘totalizing’ claim to universal applicability was increasingly transferred from divinity to infinity: especially the infinity of space and time as they were radically reconstructed by Renaissance art and science. Postmodernism is the condition of coping without these absolute common denominators, especially without the neutral and homogeneous media of time and space which are the quintessential, field-unifying media of modernity.

Postmodernism specifically challenges the European culture that took its direction from the Renaissance, developed through the seventeenth century and the Enlightenment, and remains a common discourse for most citizens of Western democratic societies. In philosophy, in the arts, in science, in political theory and in sociology, postmodernism challenges the entire culture of realism, representation, humanism and empiricism. Postmodern critique thus goes to the very foundation of personal, social and institutional definition. Its challenges to knowledge and institutions are felt particularly in universities.

2 The role of language

Already well under way in the nineteenth century, the critique of Enlightenment rationalism found its postmodern turning point in the spreading influence of Ferdinand de Saussure, a Swiss teaching at Geneva whose lectures on linguistics (published in 1916 as *Cours de Linguistique Générale*) have become a keystone of postmodernism. Saussure’s deceptively simple idea was that the linguistic sign acts reflexively, not referentially. The word, he said, functions not by pointing at the world, but by specifying an entire system of meaning and value in which each word has its function. (Technically, Saussure’s word points to an idea, but that idea is itself linguistic; there is nothing prior to language.) To read or understand even the simplest linguistic sequence is to recognize difference; it is to perform an incalculably complex and continuous act of differentiation, which becomes more and more balanced and rich the more that linguistic sequence verges towards poetry or other complex usage.

In one way this is only common sense. Any speaker of more than one language knows the arbitrariness of the sign: what is ‘dog’ here, is ‘chien’ there. But the more languages one knows, the more obvious becomes the systemic value of any word, the more obvious the fact that it has no exact equivalent elsewhere, either in other languages or in the world. To take the simplest possible example, we understand the English word ‘dog’ not merely because conventionally we have associated it with a creature, but more complexly and largely because we differentiate it by composition and function from other words and functions (for example, from ‘dot’, ‘log’, ‘bog’, and from verbs, adverbs, conjunctions). What is being described in these rather dry terms is the language’s capacity for poetry: its capacity as a living language to provide its speakers with particular alphabets and lexicons of possibility, and to modify, even radically, the usages with which we constitute our worlds.

The postmodern moment, as Derrida says, is the moment ‘when language invaded the universal problematic’; this is the moment when it becomes clear that everything operates by such codes, that everything behaves like language. Body language, garment language, the silent expression of gesture, the layout of a city or a fashion magazine or a university: all these are complex, coded systems of meaning and value in which we function simultaneously in several, even many, at once. Even in humdrum activities we are expert well beyond our conscious measures. Language thus conceived is a model of organization that is both powerful and finite.

For describing systems of value that work like language, the terms *episteme* and *discourse* have emerged as useful. *Episteme* suggests the systemic nature of all knowledge (one can speak of the Western episteme); and *discourse* suggests the systemic nature of all practices (moral, social, domestic, political, reproductive, economic, intellectual). These two terms at least help the mind to find the fulcrum that allows thought to run in directions different from those inspired by terms like ‘reality’ or ‘nature’ (see §3).

Postmodernism differs from deconstruction, with which it is sometimes confused. Deconstruction is a methodology with agendas similar to some of postmodernism but with a much more limited capability. Deconstruction is a negative movement by which an interpreter of a code or sign-system (for example a novel or a psychoanalysis) looks for what is *not* present rather than what is present - looks for the points of crisis and breakdown in a system or a rationalization rather than its more obvious positivities. This methodology has the initial value of opening interpretation to complex reading, but it soon gets lost in circularity; the negative quality of its questioning often limits the creativity of the response. It is almost as though deconstruction is riveted on what it

has not got, operating on a kind of nostalgia for the referential view of language that postmodernism revises (see Deconstruction).

Postmodernism does not weep for referentiality. If the sign does not refer simply, but instead specifies a system of meaning and value, then interest lies in discovering what systems actually are in play and in seeing what different systems are capable of, whether they be literary texts, political movements or personal lives. This valence of postmodernism can be found not so much in the theoretical texts which have had such extensive recent attention, but in the creative work of artists and scientists who have in many cases anticipated the philosophical critiques of rationalism, and have gone well beyond them to locate their practical implications. Artists and film-makers like Magritte and Buñuel, postmodern novelists like Robbe-Grillet and Nabokov, post-Einsteinian scientists interested in quanta and chaos, feminists interested in new acts of personal and political attention, and architects who play with traditional conventions have explored the practical and material implications of postmodernism far more fully than have many of the more theoretical writers.

3 Challenge to the bases of consensus and representation

The view that all systems are self-contained and largely self-referential has a radical implication that either alarms or inspires - the implication that no system has any special purchase on Truth and, in fact, that it is impossible to establish a Truth. This implication goes beyond the recuperable relativism of the nineteenth century to unrecuperable difference in the twentieth. Where relative systems could still cohabit in the single world of modernity, postmodernity involves the recognition that, to a large extent, one's relative systems *construct* the world. In short, that the world is *not* One; that words like 'truth,' 'nature', 'reality' and even 'human' are weasel words because they imply, falsely, that an autonomous world of meaning and values exists, and that it *transcends* all finite and mutually exclusive human systems and somehow guarantees them. Postmodernism denies absolute status to any truth or nature or reality. The question always remains - what truth, which nature, whose reality?

While this post-structuralist critique of transcendence goes back to Plato, the postmodern version limits its ambit to the particular forms of transcendence made available in the Renaissance and Enlightenment. The discourse of modernity extends to infinity its neutral media of space and time and, in so doing, encourages us to forget finitude and to distribute our energy toward an infinite horizon. The discourse of postmodernity, on the other hand, treats time and space as dimensions of finite systems. This recognition of absolute and unmediateable finitude inspires reflexiveness because activity no longer can be referred to unchanging external absolutes. Such reflexiveness always remains experimental or improvisatory, and inaccessible to universal generalization.

The disappearance of transcendental reference creates four related crises: the crisis of 'the subject' (the irreducible individual, the one that is because it thinks or is conscious); the crisis of 'the object' (the 'things' - including the individual - that constitute a world that is single, not multiplied); the crisis of 'the sign' (the word that refers to the world thus constituted); and, consequently, the crisis of historicism (the temporal humanism that constitutes an uneasy unity in the world by formulating transcendence as The Future).

Postmodernism presents a new problematic of negotiation between finite systems of meaning and value where no transcendental reference is possible. This negotiation goes on all the time in complex ways but, in the discourse of modernity, neither philosophy, nor political science, nor indeed any science, nor even much art has attended to it. This new problematic is, in Craig Owens' words, 'how to conceive difference without opposition', and how to translate that problematic, as the Renaissance translated Christian humanism, into social and political terms.

Where modernity sought the single system, postmodernity plays with the elements of systems, combining them for limited agendas, using what is useful and leaving the rest, refusing responsibility for consistency within this or that totalized explanatory system. This 'bricolage' becomes a key value for postmodernism. What one wants to avoid at all costs is something without play, without slack, without the living capacity for movement; one wants play in the line, play in the structure, in the sense of flexibility and variability even to the point of reorganizing the structure.

By conceiving all particulars and practices as functions of systems rather than as semi-autonomous entities, postmodernism poses especially interesting problems for two agendas of modernity that are particularly valuable to twentieth-century social and political function: historicism and individualism. History as a single, universal system of human explanation depends upon a construction of temporality that belongs to humanism and the

Renaissance; its very notion of temporality is a kind of single-point perspective in time. Postmodernism puts history in the interesting position of considering its own historicity. The individual subject, sometimes appearing as the Cartesian *cogito*, does not, despite alarms, entirely disappear in postmodernism into systemic function. But individual identity and agency do have new definitions and functions when all practice is conceived differentially and systemically rather than naturally. Whatever is individual about a life, its unique and unrepeatable poetry, comes not from some 'natural' essence but from its particular specification of the complex discourse it inhabits.

Given the extent of the reformation implied by postmodernism, it is not surprising to find a flutter of reaction against it, not all of it informed and much of it governed by a desire to rescue particular epistemic investments from devaluation. The emphasis on linguistic reflexiveness, on the power of a system of signs to constitute meaning and value, has been taken by some commentators as an expression of inward-looking narcissism, a flight from 'reality' and, even, a threat to morality and order: it is as if the social, political and epistemic problems to which postmodernism responds were created by it, rather than by the entire culture of modernity. Postmodernism does not spell the end of meaning and value, still less the end of humanist meaning and value, but it does spell the end of certain hegemonies, especially those vested in what Alain Robbe-Grillet calls 'habitual humanism'. In any case, Saussure's idea of the reflexivity, rather than the referentiality of language has by no means yet been fully explored.

The postmodern critique, amid clatter and confusion, is only just under way. There is no responsible way to anticipate its full implications or trajectory. One can see, however, that postmodernism offers both a new freedom and a new constraint. The emphasis on the constructed nature of all knowledge and projects means that, because they have been invented, they can be changed; there is, morally or socially speaking, no 'nature' of things. On the other hand, the fact that with our languages we inherit so much of our beliefs and values ready-made means that we are much less original and autonomous than modernity suggested, and we express agency more locally, more collectively and less heroically than modernity allowed.

Postmodernism and political philosophy

Just as there is much disagreement over both what is meant by 'postmodernism' and which thinkers fall under this rubric, so also is there disagreement over its implications for political philosophy. The claim of postmodernists that raises the most significant issues is that Western modernity's fundamental moral and political concepts function in such a way as to marginalize, denigrate and discipline 'others'; that is, categories of people who in some way are found not to measure up to prevailing criteria of rationality, normality and responsibility, and so on. The West's generally self-congratulatory attitude towards liberal democracy and its traditions obscures this dynamic. Postmodernism aims to disrupt this attitude, and its proponents typically see their efforts as crucial to a radicalization of democracy.

1 'Otherness' and critique

Postmodernism aims at exposing how, in modern, liberal democracies, the construction of political identity and the operationalization of basic values take place through the deployment of conceptual binaries such as we/them, responsible/irresponsible, rational/irrational, legitimate/illegitimate, normal/abnormal, and so on. Rather than focusing upon the first term of each pair, and thus encouraging a thoroughly affirmative image of the achievements of the West, postmodernists draw attention to the ways in which the boundary between the two terms is socially reproduced and policed. This process takes place within the general sway of what is seen as modernity's deep, but questionable, commitment to expanding our mastery of self, society and nature. This persistent commitment creates pressure for hardening boundaries, simultaneously fostering conformity among those who fall on the 'correct' side of the dividing lines, and marginalization and denigration for those on the 'wrong' side. The 'others' engendered by this dynamic may be racial, ethnic, sexual, national, or they may have no easily identifiable, external characteristics. They may simply not measure up in terms of some scale of normality. (Perhaps the classic postmodern critique in this vein is Foucault's *Discipline and Punish* (1977); see Foucault, M.) Given these concerns, it is easy to see affinities between postmodernism and other contemporary political initiatives, such as multiculturalism and feminism (see Feminist political philosophy §6; Multiculturalism).

Critics have often faulted postmodernists for the totalized quality of their critique. Both liberal democracies and far more authoritarian regimes are rendered into objects equally to be condemned: each creates and disciplines others, even if the precise mechanisms differ. This equation, critics have argued, robs political philosophy of any basis for making crucial normative distinctions between types of regimes.

Proponents respond that this argument misses their point. They seek only to deepen the critique of democracy, by sensitizing its supporters to the problem of otherness. But exactly what political orientation follows from such a perspective? Although there is a fair amount of uncertainty here, it is possible to sketch several alternatives.

2 Radicalizing democracy

Perhaps the most directly engendered political orientation stemming from postmodernism would be the stance of ongoing, impertinent dissent in which the goal is to highlight continually various modes by which the cognitive machinery and institutions of existing democracy spawn otherness. This would be a type of anarchism whose substantive orientation is directly parasitic upon the qualities of the system it attacks. No alternative political vision is offered. At its best, this stance might have the salutary effect of continually bringing to light inconspicuous phenomena of injustice. At its worst, it might become a sort of automatic propensity to disrupt, unconcerned about deleterious side effects.

Although ongoing criticism is part of what an enhancement of democracy would imply for many postmodernists, it is usually seen, on its own, as being too limited. What more affirmative vision does postmodernism offer? Sometimes there is allusion to what might be called an 'other politics', radically divorced from the present. In this vein, Derrida has spoken of 'the future of another law… lying beyond the totality of this present' (1985: 298); similarly, Foucault (1980) offered the idea of 'a new form of right'. The meaning of such appeals remains problematic since they have not been elaborated in any detail. Critics suspect that such a 'politics of the ineffable' is a rather obvious strategy for those who begin with such totalized critiques (McCarthy 1991).

Another way of rethinking politics would be in terms of some reorientation of liberal democracy's spirit or

institutions so as to make them more hospitable to otherness. One form this takes is a reconsideration of the prevailing understanding of democratic sovereignty and community as residing with ‘the people’, in whom final, unquestionable authority resides (see Democracy). This is a unifying, homogenizing concept that in fact has no reality in political processes and decisions, where, at most, segments of the population express their will. Postmodernists suggest that we reimagine democratic community in a more radically open way, as something never fully present, but rather always in essential relation to those who are absent from, or defeated or shunted aside in, any particular expression of political will. The bond of such a community would be acknowledged as a tenuous one, embodying as it does a more vivid realization of difference. It could be thought of as sustained by mutual ‘agnostic respect’, as Connolly (1991) has put it. In effect, this would mean that each individual or group would accept that the formation of its identity is always simultaneously the formation of that which it is *not* - its others. The resulting tension is inevitable; we thus do best to recognize and honour it as an existential condition. Ideally, democracy is the regime most congruent with this condition.

This sort of rethinking of the binary ‘us/them’ within a democratic community also has implications for how the external relations of polities are conceived. Postmodernism’s broad questioning of the constitution and policing of fundamental political dichotomies strikes directly at the sharp internal/external distinction that is at the philosophical heart of the predominant, state-centred view of international politics. Postmodernism here would invite us to consider more critically the way the presence of a state boundary is allowed to discount radically possible obligations to others who are defined as part of what is external or foreign. All of the foregoing suggestions for rethinking democracy could be categorized as components of something like a new philosophical ethos for democracy; that is, a new sensibility towards political life. But how would this new attitude towards otherness take shape institutionally? What institutions would be more hospitable to otherness and yet constrain it where appropriate? There does not appear to be much agreement on answers to such questions.

Consider, for example, the liberal value of tolerance (see Toleration). Postmodernism would presumably urge one not just to tolerate otherness, but rather celebrate it to some degree. But what would this mean in specific cases? Would one be more tolerant than liberals of pornography or radical groups that preach racism, or less tolerant? If one opted for the latter alternative, on the grounds that to do otherwise would express hostility to women or racial minorities, would that not also constitute a kind of intensification and enhanced policing of the bonds of community, an us/them?

Similar perplexities arise over the issue of what is called the liberal neutrality of the state. This traditional and central value of liberal politics holds that the state ought to be largely neutral *vis-à-vis* various sorts of groups; it should avoid using law to enhance or impede their cultural flourishing (see Liberalism; Neutrality, political). Postmodernism would seem to be at odds with this value. The claim is that liberal states are not in fact ever able to be completely neutral; formal neutrality merely allows culturally hegemonic groups to dominate and marginalize less powerful ones. On this view, a fairer democratic state would then be one that fiscally and institutionally tried to maintain a better balance. Of course, as with toleration, specific proposals to implement such ideas generate new quandaries. If the state is to subsidize the cultural and organizational life of some groups to a far greater degree than now, what will the criteria be for who gets funds and who does not? Will the distinction supported/unsupported carry its own invidiousness; and will it be worse than the present liberal alternative? (See Citizenship §3).

Postmodernism, French critics of

French anti-postmodernism emerged with the generation of philosophers that came of age in the late 1970s and early 1980s and counts among its ranks some of the most visible and prolific young scholars in France. Unlike schools of thought such as phenomenology, existentialism or Marxism, French anti-postmodernism has no founding figure, central text or core doctrine; anti-postmodernism (a term seldom, if ever, used by the French) therefore is less a philosophical school than a characterization for a diverse group of thinkers who react against those trends that have dominated French intellectual life since the Second World War, especially Marxism, structuralism, existentialism and deconstruction. These trends, grouped together under the heading of 'postmodernism', are seen by anti-postmodernists as the last episodes in a failed intellectual adventure whose origins go back at least to the French Revolution.

Critical of nineteenth-century philosophy as having produced, on the one hand, totalizing, speculative philosophies such as those of Hegel and Marx, and, on the other hand, the anti-rationalism of Nietzsche and his postmodern scions, anti-postmodernists (or neo-moderns as the French prefer to say) represent a return to the concept of the individual and of history as the product of free human agency. Reaffirming the efficacy of public, rational discourse, they tend to be interested in political philosophy, taking democracy and its ideals as a model for raising and addressing philosophical issues. Pluralist in their outlook, they value the disciplinary structure of scholarly work; fields such as epistemology, theology, philosophy of science and the history of ideas which were neglected or marginalized by much postmodern thought have enjoyed renewed prestige and interest among the anti-postmodernists.

1 Historical background

Several main currents shaped French philosophy during the last half of the twentieth century; the tradition of German philosophy has been most important of all. From the nineteenth century, Hegel, Marx and Nietzsche played particularly prominent roles as did the thought of Husserl, Freud and Heidegger from the twentieth century. In addition to these, the early twentieth-century Swiss linguist Ferdinand de Saussure is credited with providing the inspiration for the emergence of structuralism during the 1950s. The 1960s and 1970s in France produced a distinctive mélange of German and structuralist philosophy that is often referred to as post-structuralist or postmodern philosophy. Though both postmodernists and anti-postmodernists would agree on these influences and the general stages of development, they disagree on their nature and significance.

After the Second World War two philosophical traditions were particularly prominent in France. Thanks to Alexandre Koyré and Alexandre Kojève during the 1930s and to Jean Hyppolite, Maurice Merleau-ponty and others during the post-war years, Hegelianism displaced neo-Kantianism as the leading school of thought (see Hegelianism). In particular, Hegel's conception of an all-encompassing dialectical history became an important resource for philosophical and political reflection during these turbulent decades. Merleau-Ponty, Emmanuel Levinas and Jean-Paul Sartre, among others, also introduced Husserl's phenomenology of consciousness and Heidegger's analysis of being and human existence to French thinkers. However, it was above all Sartre who, through his literary endeavours and political activism in addition to his philosophical works, popularized a synthesis of Marxism and existential phenomenology, an orientation that remained mainstream among the traditionally leftist French intelligentsia until the revolt of May 1968, after which its popularity waned. His existential Marxism was a humanism, that is, an ideology that envisaged an historical process of consciousness raising whereby individuals and humanity as a whole would be emancipated to their authentic mode of existence (see Existentialism).

While existential Marxism became increasingly popular from the 1930s to the mid-1960s, beginning in the 1950s there was a second important intellectual development. Inspired by Saussure's linguistics, several disciplines developed the method of analysis and theory of meaning that came to be known as structuralism (see Structuralism). Among them were the anthropology of Claude Lévi-strauss, the psychoanalysis of Jacques Lacan, and the literary theory of Roland Barthes. Of particular importance was the frame of reference for their analyses: they focused not on the 'lived experience' of an individual consciousness nor on the progressive emancipation of human nature, as did the existential Marxists, nor did they have a comprehensive ideology in the light of which the

significance of a given historical phenomenon could be adduced. For structuralists, the meaning of a word or, more generally, a ‘signifier’ is determined not by the intentions of the individual but by its differential relation to the system of signifiers that constitutes a given language; meanings are therefore relative to a specific linguistic culture rather than a product of individual human consciousness or of a universal, eschatological system such as Hegel’s. Therefore, in framing their investigations in terms of systemic structures and their instantiation in linguistic, social and psychological phenomena, the structuralists conceived of their method as scientific and objective in contradistinction to the subject-oriented, humanistic and ideological character of Hegelian, Marxist and phenomenological philosophies of consciousness.

Those philosophers educated in the 1950s and who emerged during the 1960s as dominant figures of postmodern philosophy were greatly influenced by structuralism in two particularly noteworthy respects. First, in privileging structure over process as well as the plurality of semiological systems over a universal system, they unequivocally rejected the cross-cultural and transhistorical philosophies of Marx and, especially, Hegel. Teleological history and its dialectical rationality came to be seen as an empty, neo-theological idealism divorced from facts. Second, and related to the first, the plurality of linguistic systems, and hence the plurality of possible meanings of a word or signifier, gave rise to a critique of the univocity of concepts. Above all, the concept of identity or of the self-identical subject so fundamental to philosophy since Descartes’ *cogito* came to be seen as a substanceless fiction posited by the Western European philosophical tradition (see Alterity and identity, postmodern theories of). The structuralist critique of Hegelian history and its basis in subjectivity eventually led to the reconfiguration of Marxism in the structuralist philosophy of Louis Althusser, who coined the term *anti-humanism* to describe his Marxism in which individuals were conceived of as sites in a general system of production and in which history was conceived of as a process with no subject, that is, as having no underlying unity or direction.

Georges Bataille, Gilles Deleuze and Pierre Klossowski were among those who introduced Nietzsche’s thought to France in the late 1950s and 1960s; this, coupled with the later Heidegger’s influential critique of technology and calculative reason, reinforced the anti-Hegelian elements of structuralism. Salient features of French Nietzscheanism were the critiques of identity, subjectivity and reason, the advocacy of the primordial status of language and the consequent centrality of ‘questions of interpretation’ in the place of ‘questions of fact’, and the rejection of progressivist or teleological conceptions of history. Discerning a complicity between the anthropocentrism of humanism and the metaphysics of modern philosophy inaugurated by Descartes and culminating in Kant and Hegel, postmodern philosophers influenced by Nietzsche - Heidegger, Jacques Lacan, Michel Foucault, Gilles Deleuze, Jacques Derrida, among others - proclaimed, each in their own way, ‘the death of man’, that is, the end of metaphysical humanism, the collapse of which defines the postmodern condition. In this respect they all, in one manner or another, affirm along with Nietzsche an ontological nihilism. Despite significant differences among them, they all find in Hegel the culmination of foundationalist modern philosophy as well as its foundering, and they all accept the uncertain, perspectival and ontologically nihilistic character of the contemporary age. By 1979, when Jean-François Lyotard published *La Condition Postmoderne* (*The Postmodern Condition*, 1984) which popularized the philosophical sense of ‘postmodernity’ and after the traditionally progressivist left had suffered political collapse in the election of 1978, postmodernism - Derrida’s deconstruction, Foucault’s archaeo-genealogy and Deleuze’s schizoanalysis, to name only the most prominent figures of postmodernism - had found a home in the leading universities and intellectual institutions of France (see Deconstruction; Postmodernism; Post-structuralism).

2 Points of contention

One of the most basic differences between postmodernists and anti-postmodernists is their divergent interpretations of history. Postmodernists hold that in some serious sense history and modernity have come to an end, be it with the collapse of Hegelianism, with the Nietzschean critique of metaphysics, or simply through exhaustion; their critiques and deconstructions are dedicated to driving home that the philosophical basis of progressive modernity has met its end. However, anti-postmodernists see postmodernism thereby as falling prey to a concept of historical necessity and therefore taking the collapse of speculative philosophy as determinative. Anti-postmodernists agree that the emancipatory project of Kant’s Enlightenment and the subsequent absolutization of historical reason in Hegel and Marx were ill-fated. But they do not see this as the final or inevitable conclusion of modern philosophy or historical progress. Rather, what they see ending is postmodernism, which for them is not the deconstructive revelation of a Hegelian error but its continuation. Holding that

postmodernism was too conditioned by the Enlightenment it sought to criticize, Luc Ferry proclaims that anti-postmodernists have grown beyond postmodernism and that ‘for the first time no doubt in the history of humanity, we are living in a time when this critique [of Enlightenment reason] has reached the minimal threshold of maturity’ (1995: 168).

If the metaphysics of the Enlightenment was a misadventure whose repercussions produced the terror of the French Revolution, the misology of Nietzsche and the postmodern critiques of subjectivity and reason, it nevertheless remains possible, according to anti-postmodernists, to discover other historical possibilities for thought and action than those that led to postmodernism. Accordingly, they are drawn to Alexis de Tocqueville rather than J.-J. Rousseau or Kant, to J.G. Fichte rather than Hegel or Marx and to Benjamin Constant rather than Nietzsche. Anti-postmodernists find in these and like thinkers not the death knell of history but indications of its infinitely open future horizon. For them, history is less the primary determinant (rational or otherwise) than it is a single, albeit important, element in human theoretical and practical endeavours.

A second and related basic issue at stake for anti-postmodernists also goes back to German Idealism. Although anti-postmodernists too are critical of the metaphysics of reason and its ideological excesses, they hold that the postmodern critique leads to a sterile nihilism. Vincent Descombes (1980: 182) sums up this complaint when he says for postmodernism there is:

> no *original*, the model for the copy is itself a copy … no *facts*, only interpretations and any interpretation is itself the interpretation of an older interpretation; there is no *meaning proper* to words, only figurative meanings … no *authentic version* of a text, there are only translations; *no truth*, only pastiche and parody.

And as Luc Ferry claims, this anti-humanism cripples the individual and leads to authoritarianism, either by giving rise to a panoply of master thinkers (such as Hegel, Marx, Nietzsche, Heidegger, Foucault, Derrida) who produce hermetic systems of oracular discourse that admit of no falsification, or by elevating non-human things, such as the natural environment, to a point where humanity is rendered insignificant if not odious (see Ecological philosophy §1; Næss, A.). According to Ferry, the challenge of anti-postmodernism is to develop a non-metaphysical humanism, that is, a conception of rationality and the subject that leads neither to the ideological excesses of the post-Enlightenment, nor to their debasement in postmodernism.

The anti-postmodernist emphasis on the individual, reason and their vision of the future as open to determination by human spontaneity indicates that freedom and the belief in the efficacy of rational discourse are central to anti-postmodernist thought and also reveals its predominantly political orientation. Often identifying with the seventeenth-century ‘quarrel of the ancients and the moderns’ in which modern, scientifically oriented philosophy rejected the theological, aesthetical and moralizing thought of the Renaissance, anti-postmodernists tend to be concerned with that open space in which communal thought and activity are constituted and which is supported by democratic processes. In this regard, the communicative demands of cooperative political activity valued by anti-postmodernism is clearly at odds with the effacing of the distinction between fact and fiction wrought by structuralism and extended by the Nietzschean, postmodern critique of reason.

The anti-postmodern appeal to common sense has capitalized both on some of the extravagances of postmodernism and on its relatively esoteric character. However, although their concerns are substantive and their criticisms often illuminating, anti-postmodernists often indulge in characterizations; more importantly, anti-postmodernists have yet to address adequately issues raised by postmodernism that touch on the viability of a positive conception of anti-postmodernism. Among these are the constitution of the conscious subject, the nature of language and its relevance for discourse and knowledge, the manner in which the past bears upon and influences the future, and the possibility and value of a non-metaphysical rationality. Its ability to address these and related matters will determine whether anti-postmodernism signals the epochal shift many of its members claim is at hand, or whether it proves to be only the most recent reactionary philosophical tantrum.

Post-structuralism

Post-structuralism is a late-twentieth-century development in philosophy and literary theory, particularly associated with the work of Jacques Derrida and his followers. It originated as a reaction against structuralism, which first emerged in Ferdinand de Saussure's work on linguistics. By the 1950s structuralism had been adapted in anthropology (Lévi-Strauss), psychoanalysis (Lacan) and literary theory (Barthes), and there were hopes that it could provide the framework for rigorous accounts in all areas of the human sciences.

Although structuralism was never formulated as a philosophical theory in its own right, its implicit theoretical basis was a kind of Cartesianism, but without the emphasis on subjectivity. It aimed, like Descartes, at a logically rigorous system of knowledge based on sharp explicit definitions of fundamental concepts. The difference was that, for structuralism, the system itself was absolute, with no grounding in subjectivity. Post-structuralist critiques of structuralism typically challenge the assumption that systems are self-sufficient structures and question the possibility of the precise definitions on which systems of knowledge must be based.

Derrida carries out his critique of structuralist systems by the technique of deconstruction. This is the process of showing, through close textual and conceptual analysis, how definitions of fundamental concepts (for example, presence versus absence, true versus false) are undermined by the very effort to formulate and employ them. Derrida's approach has particularly influenced literary theory and criticism in the USA. In addition, Richard Rorty, developing themes from pragmatism and recent analytic philosophy, has put forward a distinctively American version of post-structuralism.

1 Structuralism

In his lectures on linguistics, Ferdinand de Saussure proposed a view of language (*langue*) as a formal structure, defined by differences between systemic elements. According to Saussure, this structure is simultaneously present in and unites the two domains of thought and words. A given linguistic term (a sign) is the union of an idea or concept (the 'signified') and a physical word (the 'signifier'). A language is a complete system of such signs, which exists not as a separate substance but merely as the differentiating form that defines the specific structure of both signifiers (physical words) and signifieds (ideas). Saussure's view rejects the common-sense picture of the set of signifiers and the set of signifieds as independent givens, with the signifieds having meaning in their own right and the signifiers obtaining meaning entirely through their association with corresponding signifieds. Saussure denies this independence and instead maintains that signifiers and signifieds alike have meaning only in virtue of the formal structure (itself defined by differences between elements) that they share (see Structuralism in linguistics).

Saussure's structuralist approach was very successful within linguistics, where it was applied and extended by, among others, Jakobson and Troubetzkoy. By the 1950s the approach had been adapted in anthropology (Lévi-Strauss), psychoanalysis (Lacan), and literary theory (Barthes); and there were hopes that it could provide the framework for rigorous accounts in all areas of the human sciences. Three distinguishing features of this framework were: (1) a rejection of all idealist views of concepts and meanings as derived from the activity of consciousness; (2) an understanding of concepts and meanings as, instead, grounded in the structural relations among the elements of abstract systems; (3) an explication of such structural relations solely in terms of bipolar differences (for example, real/unreal, temporal/nontemporal, present/absent, male/female).

2 Post-structuralism: terminology

Post-structuralism is obviously closely tied to structuralism, but commentators have characterized the relationship in a variety of mutually inconsistent ways. Some writers make no distinction between structuralism and post-structuralism, applying the single term 'structuralist' to the entire range of thinkers from Saussure through to Derrida. More commonly, post-structuralism is distinguished as a separate development, but there is disagreement as to whether it is primarily a reaction against structuralism or an extension of it (as the term *Neostrukturalismus*, commonly used by Manfred Frank and other German commentators, suggests). Apart from matters of definition, there is even disagreement as to whether major figures such as Barthes, Lacan and Foucault are structuralists or post-structuralists.

Michel Foucault's book, *Les mots et les choses* (translated under the title *The Order of Things*) is an instructive example. In one sense it is quintessentially structuralist. The book first uncovers the fundamental epistemic systems (which Foucault calls 'epistemes') that underlie and delimit the subjective thought of particular eras. It then goes on to show how the apparent ultimacy of subjectivity is itself just the product of one contingent episteme, that of modernity, which is even now disappearing (the famous 'death of man'). Nevertheless, Foucault's essentially historical viewpoint in the work demonstrates the limitation of structuralism: its inability to give any account of the transitions from one system of thought to another. Foucault seems to have seen from the beginning that structuralism can not be historical, a fact that explains his constant insistence that he was not a structuralist, in spite of his obvious deployment of structuralist methods and concepts. So, although *Les mots et les choses* is a structuralist book, it at the same time makes clear the limits of structuralism and prepares the way for Foucault's later work on power and ethics which is distinctly post-structuralist (see Foucault, M.; Post-structuralism and the social sciences).

Despite these ambiguities and disagreements, the concept of post-structuralism is useful, if not essential, for understanding philosophy in France during the latter part of the twentieth century. One fruitful approach is to think of post-structuralism as a philosophical reaction to the structuralism that was such a powerful force during the 1960s in linguistics, psychology and the social sciences. It was neither a simple rejection or extension of structuralism but a series of philosophical reflections on the structuralist programme and achievement.

3 Two major post-structuralist theses

Although structuralism was never formulated as a philosophical theory in its own right, its implicit theoretical basis was, as noted above, a kind of Cartesianism without the subject. (Hence, the association of structuralism with the notion of the 'death of the subject'.) Post-structuralist critiques of structuralism are typically based on two fundamental theses: (1) that no system can be autonomous (self-sufficient) in the way that structuralism requires; and (2) that the defining dichotomies on which structuralist systems are based express distinctions that do not hold up under careful scrutiny.

The first thesis is not understood so as to support the traditional idealist view that systematic structures are dependent on the constitutive activities of subjects. Post-structuralists retain structuralism's elimination of the subject from any role as a foundation of reality or of our knowledge of it. But, in opposition to structuralism, they also reject any logical foundation for a system of thought (in, for example, its internal coherence). For post-structuralists, there is no foundation of any sort that can guarantee the validity or stability of any system of thought.

The second thesis is the key to post-structuralism's denial of the internal coherence of systems. The logical structure of a system requires that the applications of its concepts be unambiguously defined. (In the formalism of elementary number theory, for example, there must be no question as to whether a given number is odd or even.) As a result, the possibility of a systematic structure depends on the possibility of drawing sharp distinctions between complementary concepts such as odd/even, charged/uncharged, living/non-living, male/female and so on. Post-structuralist philosophers have been particularly concerned with the fundamental dichotomies (or oppositions) underlying structuralist theories in the human sciences. Saussure's linguistics, for example, is based on the distinction of the signifier from the signified; Lévi-Strauss's anthropology of myths employs oppositions such as raw/cooked, sun/moon and so on. In each case, post-structuralists have argued that the dichotomy has no absolute status because the alternatives it offers are neither exclusive nor exhaustive.

4 Derrida's critique of logocentrism

This sort of critique was extended to philosophy, particularly by Jacques Derrida, who finds Western philosophical thought pervaded by a network of oppositions - appearance/reality, false/true, opinion/knowledge, to cite just a few examples - that constitute what he calls the system of 'logocentrism'. This term derives from Derrida's conviction that at the root of Western philosophical thought is a fundamental distinction between speech (*logos*) and writing. Speech is privileged as the expression of what is immediate and present, the source, accordingly, of what is real, true and certain. Writing, on the other hand, is derogated as an inferior imitation of speech, the residue of speech that is no longer present and, therefore, the locus of appearance, deceptions and uncertainty. Plato's devaluation of writing in comparison with living dialogue is the most famous and influential example of this distinction. But

Derrida finds the distinction pervading Western philosophy and regards it as not just a preference for one form of communication over another but the basis for the entire set of hierarchical oppositions that characterize philosophical thought. Speech offers presence, truth, reality, whereas writing, a derivative presentation employed in the absence of living speech, inevitably misleads us into accepting illusions.

Derrida's critiques of the speech/writing opposition - and of all the hierarchical oppositions that attend it - proceed by what he calls the method of 'deconstruction' (see Deconstruction). This is the process of showing, through close textual and conceptual analysis, how such oppositions are contradicted by the very effort to formulate and employ them. Consider, for example, the opposition between presence and absence, which plays a fundamental role in Husserl's phenomenology (and many other philosophical contexts). Husserl requires a sharp distinction between what is immediately present to consciousness (and therefore entirely certain) and what is outside of consciousness (and therefore uncertain). But once Husserl undertakes a close analysis of the immediately present, he discovers that it is not instantaneous but includes its own temporal extension. The 'present', as a concrete experiential unit, involves both memory of the just-immediately-past (retention, in Husserl's terminology) and anticipation of the immediate future (protention). Thus, the past and the future, both paradigms of what is absent (not present), turn out to be integral parts of the present. Husserl's own account of the presence/absence opposition overturns it.

Deconstruction maintains that there is no stability in any of thought's fundamental oppositions. Their allegedly exclusive alternatives turn out to be inextricably connected; their implicit hierarchies perpetually reversible. As a result, there is an ineliminable gap between the intelligibility of a rational system and the reality it is trying to capture. Derrida expresses this gap through a variety of terms. He frequently speaks of *différance* (a deliberately misspelled homophone of the French *différence*) to emphasize, first, the difference between systematic structures and the objects (for example, experiences, events, texts) they try to make intelligible, and, second, the way in which efforts to make absolute distinctions are always deferred (another sense of the French *différer*) by the involvement of one polar opposite in the other. This latter phenomenon Derrida also discusses in terms of the 'trace' of its opposite always lingering at the heart of any polar term. He also employs the term 'dissemination' to refer to the way that objects of analysis slip through the conceptual net spread by any given system of intelligibility we devise for it.

5 Post-structuralism and literary theory

Thus far the discussion has focused on Derrida's deconstruction of the meaningful structures philosophers purport to find in reality and to express in their philosophical texts. But Derrida's approach is also readily applicable to literary texts (and the 'worlds' they create). This is because - like philosophical systems - poems, novels and other literary texts are typically thought to embody complete and coherent systems of meaning, which it is the task of literary criticism to extract. Although Derrida himself has dealt primarily with philosophical texts, his approach has been widely adopted by analysts of literature. (Of course, as should be expected, Derrida and his followers reject any sharp distinction between the philosophical and the literary.)

Traditional literary analysis has understood the meaning of a text as the expression of its author's mind; that is, as thoughts the author intended to convey in writing the text. The first stage of deconstructive criticism is the structuralist one of detaching meaning from authorial intention, locating it instead in the text itself as a linguistic structure. Roland Barthes, for example, showed how to analyse a text by Balzac entirely in terms of the formal codes it embodies, with no reference to what Balzac supposedly 'meant'. This structuralist move effects a 'death of the author' parallel to the anti-Cartesian 'death of the subject'. But the post-structuralists take the future step of denying a fixed meaning to even the autonomous text itself. It is not that a text lacks all meaning but that, on the contrary, it is the source of an endless proliferation of conflicting meanings. As deconstructionists delight in showing, any proposed privileged meaning of a text can be undermined by careful attention to the role in it of apparently marginal features. (For example, an orthodox Christian reading of Milton's *Paradise Lost* is deconstructed by a close study of certain details in its treatment of Satan.) There is no doubt, of course, that texts are often produced by authors trying to express what they think or feel. But what they write always goes beyond any authorial intention and in ways that can never be reduced to a coherent system of meaning.

The deconstructionist's point can also be understood as an undermining of the distinction between primary text and commentary. On the traditional view, a commentary is an effort to formulate as accurately as possible the

content (meaning) of the text. To the extent that it is successful, a commentary expresses nothing more and nothing less than this meaning. But for deconstructionists the meaning in question does not exist, and the commentary must be understood as nothing more than a free elaboration of themes suggested, but not required, by the text. Unable to be a secondary reflection, the commentary becomes as much an independent creation as the text itself.

6 Rorty's post-structuralist pragmatism

Richard Rorty's work is far removed, in both antecedents and style, from that of continental post-structuralists (see Rorty, R.). His critique of Cartesianism, derived more from Dewey than from Heidegger, is aimed at twentieth-century analytic philosophy rather than the structuralist human sciences; and his urbanely lucid prose contrasts sharply with the wilfully playful convolutions of Derrida and his followers. None the less, Rorty's analyses lead him to a critique of traditional philosophy very similar to that of the post-structuralists.

The focal point of Rorty's critique is the project (called foundationalism) of providing a philosophical grounding for all knowledge. Modern foundationalism originates with Descartes, but Rorty sees it as also the *leitmotif* of Descartes' successors, through Hume and Kant down to the logical positivists. Like Derrida, Rorty attacks traditional systematic thought by calling into question some of its key distinctions. Unlike Derrida, however, he does not carry out his attacks through close readings of classic texts but by deploying the results of recent analytic philosophy. He uses, for example, Quine's critique of the distinction between analytic and synthetic statements to argue that there are no foundational truths about the meaning of concepts. He appeals to Wilfrid Sellars's undermining of the distinction between theory and observation to reject empirical foundations of knowledge in interpretation-free sense data. He employs Donald Davidson's questioning of the distinction between the formal structure and the material content of a conceptual framework to reject Kantian attempts to ground knowledge in principles that define the framework of all possible thought.

In Rorty's view the upshot of these various critiques is to cut off every source of an ultimate philosophical foundation for our knowledge. Accordingly, he maintains, philosophy must give up its traditional claim to be the final court of appeal in disputes about truth. We have no alternative but to accept as true what we (the community of knowers) agree on. There is no appeal beyond the results of the 'conversation of mankind' so far as it has advanced to date. For us, there is no (upper-case) Truth justified by privileged insights and methods. There is only the mundane (lower-case) truth: what our interlocutors let us get away with saying.

It might seem that this rejection of foundationalism is a rejection of the entire tradition of Western philosophy since Plato. Rorty, however, distinguishes two styles of philosophy. First, there is *systematic philosophy*, the mainline of the Western tradition since Plato, which is defined by the foundationalist goal of ultimate justification. But, on the other hand, there is another enterprise, always marginal to the tradition, that Rorty calls *edifying philosophy*. Whereas systematic philosophers undertake elaborate and purportedly eternal constructions (which are always demolished by the next generation), edifying philosophers are content to shoot ironic barbs at the systematic thought of their day, exploding its pretensions and stimulating intriguing lines of counter-thought. The tradition of edifying thought can be traced back at least to the ancient Cynics and has been more recently represented by Kierkegaard, Nietzsche and the later Wittgenstein. Derrida's deconstructions are, on Rorty's view, a prime contemporary example of edifying philosophy.

Edifying philosophers, however, are philosophers only because they react against systematic philosophy. They do not differ from other sorts of cultural critics (novelists, literary theorists, social scientists) because of any distinctively philosophical method or viewpoint. If, in the wake of thinkers such as Derrida and Rorty, systematic philosophy is abandoned, philosophy will be too. The triumph of post-structuralism would, for better or worse, be the end of philosophy as we have known it.

Post-structuralism in the social sciences

Structuralism was a twentieth-century approach in various social scientific disciplines (the 'human sciences') that promised to put them on a solid scientific basis. The origin and model of structuralism was Saussure's work in linguistics. Saussure's approach was later adapted in anthropology (by Lévi-Strauss), in psychoanalysis (by Lacan), and in literary theory (by Barthes). The core of structuralism was the treatment of distinctively human domains as formal structures in which meanings were constituted not by conscious subjects but by relations among the elements of a formal system.

Post-structuralism comprises a variety of reactions to structuralism, primarily by philosophers such as Derrida, Foucault, Deleuze, and Lyotard. The first stage of post-structuralist reflection on the social sciences, best represented by Foucault's discussion at the end of The Order of Things, accepted the structuralist approach and drew from it the philosophical consequences for our understanding of the social sciences. A later stage (including Foucault's Discipline and Punish and Lyotard's writings from the 1970s on) sought to transform our conception of the human sciences through a critique of structuralist presuppositions. In this later stage, post-structuralists continued to accept structuralism's elimination of the conscious subject but maintained that human existence could not be adequately understood without taking account of non-structural causal factors such as power (Foucault) and desire (Lyotard). Foucault argued for the inextricable tie between our knowledge of society and society's power structures. Lyotard maintained that Lacan's structuralist version of psychoanalysis ignored the way that desire corresponds to a reality that escapes the boundaries of any formal structure. He also developed a political and ethical stance based on the fundamental value of a plurality of desires.

1 Structuralism in the social sciences

Structuralism originated in Ferdinand de Saussure's linguistics, which treated language as a formal system. Saussure rejected the common, representationalist view of language as a set of physical objects (for example, sounds or marks) that have meaning only in the sense that they represent mental entities (ideas), which alone are intrinsically meaningful. On his picture, both signifiers (sounds or marks) and signifieds (ideas) have meaning simply in virtue of the formal structure that they share. This formal structure is the system of identities and differences that exist among linguistic elements (on one level, sounds; on another level, ideas). Saussure identified language (*langue*) with this formal structure (see Saussure, F. de).

Lévi-Strauss' cultural anthropology is a prime example of the extension of Saussure's view of language to the social sciences. He applies the basic approach of structural linguistics to anthropological phenomena such as kinship systems and myths. Lévi-Strauss describes such phenomena in terms of the signifier/signified distinction. Thus, for the case of kinship relations, the signifieds are the thought of a culture about family relationships (for example, about degrees of and respect due to such relationships, incest taboos), while the signifiers are the specific practices (customs, rituals, and so on) that 'express' these thoughts. As in the case of Saussurean linguistics, Lévi-Strauss' approach contrasts with a representationalist one. He does not, for example, see a society or culture as having certain ideas about kinship that are then implemented by practices corresponding to them (with the practices being material images of the society's self-understanding). Rather, both the ideas and the practices are specified by their shared formal structure, once again understood in terms of differences among elements within a system. We are, accordingly, able to understand a society's ideas and practices with no reference to the minds (thoughts or intentions) of subjects (see Lévi-Strauss, C.).

2 Foucault's archaeology of structuralism

Foucault's *The Order of Things* supports the structuralist elimination of a central role for subjectivity (see Foucault, M.). Using the term 'man' to denote subjectivity as the source and locus of mental representations of reality, he first argues that the category of 'man' was merely a contingent feature of modern (roughly, nineteenth-century) thought and as such has no essential role in accounts of human life and thought. In his concluding chapter, he further argues that the recent development of structuralist social sciences, particularly Lévi-Strauss' anthropology and Lacan's psychoanalysis, points the way to a mode of thought that does not rely on this category. Such sciences, he maintains, show how we could conceive of human reality without defining it in terms of its capacity for subjective representation. Foucault agrees that the modern social sciences - psychology

and sociology, for example - are, like philosophy since Kant, based on the primacy of subjectivity. He even maintains that these ‘sciences of man’ solve the problem (which had frustrated philosophers since Kant) of how man could be both the constituting source of the world’s meaning and, at the same time, just another natural object in the world.

In Foucault’s view, the human sciences solve this problem by introducing the notion of the unconscious mind. Operating solely on the level of consciousness, philosophers could provide no coherent account of how man could be both an object within the world, fully describable in term of the fundamental categories (life, labour, and language) of the human sciences, and at the same time the transcendental subject that constitutes the world and all its objects. But, Foucault maintains, the paradox disappears once we think of the world, including man, as constituted by an unconscious mind that is not itself an object in the world. However, he further maintains that the standard modern social sciences merely describe the results of the operations of the unconscious mind; they are not able to give a direct account of the nature of the unconscious and of the conditions of its possibility. Such an account is provided only by the structuralist social sciences: Lacan’s psychoanalysis and Lévi-Strauss’ cultural anthropology.

According to Foucault, the key difference between ordinary human sciences and the structuralist sciences is that, unlike the former, the latter are able to explain consciousness and its representations of the world in terms of more fundamental principles. Specifically, Lacan and Lévi-Strauss provide a description of (respectively) psychological and cultural structures that are not themselves representational but that explain the functioning of conscious representations.

Foucault notes that in one sense these structuralist accounts provide a foundation for the modern human sciences by explaining their basic category of man. But he also notes that, in so doing, they destroy the centrality of this category. The deepest understanding of human reality is no longer in terms of the subject and its representations but in terms of unconscious structural systems. Because they thus undermine the fundamental category of the human sciences, Foucault labels these structuralist disciplines ‘countersciences’.

3 Foucault’s genealogy of power

Despite its strong structuralist sympathies, *The Order of Things* implicitly raises serious questions about structuralism that adumbrate Foucault’s later post-structuralist viewpoint. The most serious issue concerns the status of Foucault’s own methodology in the book. For all his praise of structuralism’s surpassing modern thought and heralding the ‘death of man’, it is not at all clear that his own approach is structuralist. At root, this is because he writes as a historian, concerned with the temporal (diachronic) development of thought, while structuralist accounts can yield no more than synchronic time-slices of intellectual systems.

The Order of Things avoids this issue by restricting itself to questions about intellectual systems (*epistemes* in Foucault’s terminology) at a given time. But, as he makes clear at several points (most notably in his Foreword to the English translation), there is ultimately no avoiding the essential historical question of the causes of transitions from one *episteme* to another. When Foucault subsequently takes up the causal question (particularly in *Discipline and Punish* and in volume one of *The History of Sexuality*), his approach becomes explicitly post-structuralist.

At the heart of Foucault’s post-structuralism is his notion of power. He sees relations of power as the causal factors that lead from one *episteme* to another. Power as Foucault understands it has three key features, each of which puts it beyond the ordered systems of structuralism. First, power is productive. It not only expresses the repressive, exclusionary force of a system’s constraints but also creates new domains of knowledge and practice. Second, power is not located in any single control-centre; it is dispersed throughout the social system in innumerable local seats of power. These seats interact with one another but do not form a unified system. Third, although it is intimately related to systems of knowledge, power is more than the play of signifiers and signifieds within such systems. It is ultimately the formative action of one body on another.

Foucault’s explicit recognition of the relation of power to knowledge has important consequences for his understanding of the social sciences. These consequences are most explicitly developed by his study, in *Discipline and Punish*, of the connections between modern methods of social control (such as the prison) and the emergence of criminology and related social scientific disciplines.

Foucault presents *Discipline and Punish* as a genealogical history; that is, one that details the causal processes leading to significant changes in the history of thought. Genealogy concerns the connection between non-discursive practices and systems of discourse (bodies of knowledge). In this regard, Foucault's central claim is that there is an inextricable interrelation of knowledge (discourse) and power (expressed in non-discursive practices, in particular, the control of bodies).

In emphasizing the relation of knowledge and power, Foucault does not have in mind the standard Baconian idea, which sees knowledge as first existing as an autonomous achievement (pure science) that is later used as an instrument of action (technology). He maintains that knowledge simply does not exist in complete independence of power, that the deployment of knowledge and the deployment of power are simultaneous from the beginning. On the other hand, Foucault does not go so far as to identify knowledge with power; he does not, for example, make knowledge nothing more than an expression of social or political control. As he points out, if he thought there was no difference between knowledge and power, he would not have had to take such pains to discover the precise ways in which they are related to one another.

Foucault's positive view is that systems of knowledge, although expressing objective (and perhaps even universally valid) truth in their own right, are none the less always more or less closely tied to the regimes of power that exist within a given society. Conversely, regimes of power necessarily give rise to bodies of knowledge about the objects they control (but this knowledge may - in its objectivity - go beyond and even ultimately threaten the system of domination from which it arises).

In *Discipline and Punish*, Foucault considers the specific case of the connection between modern social scientific disciplines and the disciplinary practices used to control human bodies in the modern period. His primary example is the relation of the practice of imprisonment to criminology and other social scientific disciplines that deal with crime and punishment (for example, social psychology). But he treats imprisonment in the context of modern disciplinary practices in general (as employed in schools, factories, the military, and so on); and he shows how the prison served as a model and centre of diffusion for this whole range of disciplinary practices. These practices form the matrix from which spring many of the most important modern social sciences. In the first volume of his *The History of Sexuality*, Foucault argues further that other modern human sciences - for example, psychoanalysis - are tied to modern mechanisms for controlling sexual behaviour.

4 The unconscious and desire: from Lacan to Lyotard

Just as Foucault argues the limitations of structuralist accounts of the social in the face of the reality of power, so Jean-François Lyotard emphasizes the limits of structuralist psychology in the face of the reality of desire. In order to understand Lyotard's critique, it is necessary to place it in relation to the most important structuralist approach to psychology: Jacques Lacan's formulation of Freudian psychoanalysis.

The heart of Lacan's formulation is his claim that the unconscious mind has the structure of a language. Here he is understanding 'language' in Saussure's sense of a system of signs whose meanings are entirely defined by their roles in the system. As such, the unconscious has no essential connections to external objects and its desires (drives) refer to nothing beyond the semiological system from which they receive their meaning. Orthodox psychoanalysis (for example, Heinz Hartmann's ego psychology) regards the mature conscious ego and the 'objective' adult world to which it accommodates itself as the reality to which unconscious desires must be subordinated. Lacan, on the contrary, places this ego and its world in the domain of the 'Imaginary' and insists on its subordination to the 'Symbolic' (that is, the unconscious as an autonomous sign system). Lacan also allows for a domain of 'Reality', but he presents this as an unreachable limit of symbolic structures. Accordingly, desire is nothing more than a lack that can, in principle, never be fulfilled (see Lacan, J.).

In opposition to Lacan - and to many other structuralist and post-structuralist thinkers - Lyotard asserts the autonomy and primacy of the non-linguistic object. This is not to say that he revives the foundationalist claim (often associated with phenomenology) that the object is 'simply given' to the mind in an experience unformed by any linguistic categories. Lyotard agrees that there is no pre-linguistic experience. But, he maintains, it does not follow that the content of experience is exhausted by language. 'We can say that the tree is green, but this does not put the colour into the sentence' (1971: 52).

Lyotard expresses the independent reality of the object through his distinction between 'letter' and 'line'. By

‘letter’ Lyotard means a linguistic sign as understood by Saussure: an element in a system that has significance solely in virtue of its differences from other elements in a system. If, for example, a Magritte painting contains the written message, ‘This is not a pipe’, the letters used can have any physical shape at all (so long as those shapes allow us to distinguish a *t* from a *p*, and so on) and still convey the message. But, as lines in the painting, the precise shapes of the *p*, *t* and so on, are crucial. A thick red script will convey one aesthetic meaning, a thin green one another. For the *p* and *t* as letters, pre-linguistic content is irrelevant, but for them as lines it is crucial. For ‘This is not a pipe’ as read, there is no content irreducible to the linguistic system; but for ‘This is not a pipe’ as seen, there is. To use a parallel distinction of Lyotard’s, the expression as discourse is not reducible to the expression as figure.

Given this account, Lyotard is able to reject Lacan’s construal of desire as simply the lack of an object that can never be attained. Just as perception is fulfilled by an object with an intrinsic content that cannot be reduced to the linguistic structures of consciousness, so too desire can be fulfilled by an object irreducible to the linguistic structures of the unconscious. In this way, desire takes us beyond the boundaries of a purely structuralist understanding of the unconscious.

5 Lyotard’s politics of desire

Lyotard’s post-structuralist account of desire also has consequences for social and political thought. As Peter Dews (1987) has pointed out, psychological desire and political power must be thought of as necessary counterparts. Desire is precisely that which power constrains, and desire that which struggles against power. It should, therefore, be no surprise that desire is a fundamental category of Lyotard’s social and political thought. Specifically, Lyotard tried to develop a ‘libidinal politics’: a theoretical and practical standpoint based on the fundamental value of the flourishing of a plurality of diverse desires. Lyotard, like Foucault, saw knowledge and power as essentially connected, and maintained that ‘totalizing’ theories (for example, Marxism) claiming universal validity are sources of totalitarian social structures that destroy the plurality of desires.

Lyotard pays particular attention to what he sees as the inevitable conflict between justice and truth. We continually - and properly - make judgments that particular situations or actions are unjust. But we are also inclined to think that these judgments themselves require justification through derivation from a general account of the nature of human society. We think, that is, that particular prescriptions regarding justice must be justified by the truth of general theoretical descriptions. Lyotard, however, maintains that this appeal to general truth is itself an instance of injustice. The general description presents a total picture of society that excludes all alternative views as false and rejects as unacceptable desires based on these views. But, according to Lyotard, such an exclusion is inconsistent with the fundamental value of maintaining a plurality of desires. He holds, accordingly, that we should be content with ‘indeterminate’ judgments about particular instances of justice and injustice and eschew ‘determinate’ judgments intended to justify indeterminate judgments. (A judgment is determinate or indeterminate depending on whether or not it is ‘determined’ by a general theoretical principle.)

Lyotard also formulates his view of justice in terms of his concept of the ‘differend’. A differend is an incommensurability between different standpoints (language games, narratives - ultimately, desires). The sign of incommensurability is precisely the lack of any shared criteria for mediating the differences that define the differend. Lyotard holds that the goal of politics (and also of ethics and art) should be to produce and preserve differends; and, particularly, to protect them from the ‘totalitarian terror’ of exclusionary global truth-claims.

Lyotard’s work is in many ways the most thorough and the most radical development of a post-structuralist view of society and politics. There is no doubt that his rejection of social and political theory takes us far beyond the framework of traditional discussions in philosophy and the social sciences. There will be continuing disagreement as to whether this rejection is a bracing liberation or a debilitating confusion.

Potentiality, Indian theories of

*Indian philosophers wrote a great deal about potential (*śakti*) and capacity (*sāmarthya*); both of these words may also be translated as 'power' or 'force'. The Sanskrit word* śakti*, like the English word 'potential', derives from a modal verb meaning 'to be able', so one might also see the study of potential as being the study of ability. The principal issue about which Indians debated was that of where exactly potential or ability is located. If, for example, it can be said that a person has a potential to compose a poetic masterpiece, then it can be asked where exactly that potential is located. Is it located entirely within the potential poet, or is it distributed somehow between the poet and the circumstances in which the person functions? If one says it is located entirely within the person, then it can be asked why they produce the masterpiece only at one specific time in their life instead of earlier or later. In other words, it seems that if circumstances were required to enable the person to realize their potential, then the potentiality would belong as much to external circumstances as to the person. This may not seem an interesting question in the abstract, but it became of interest to philosophers in particular contexts. It was generally agreed, for example, that nothing happens without a prior potential that becomes actualized. If this is so, then the question naturally arises, to what did the potential belong out of the actualization of which the universe 'happened'? Other questions that Indian philosophers debated were: To whom does the potential to become wise belong? How is the potential of a supposedly eternal language actualized to convey meaning? Attempting to answer such questions was a preoccupation of philosophers of every Indian school.*

1 God's potential to create

Among the philosophical traditions in classical India, some were atheistic and others theistic. The issue of whether there existed a single creator for the entire universe was one that took on many dimensions as each side produced arguments and counter-arguments of increasing sophistication. Among the many dimensions that came up for discussion, one centred on the question of whether it made sense to say of a single creator that it had a potential (*śakti* or *sāmarthya*) to create, and if it did have such a potential, how that potential could be realized. If it could be shown that it made no sense to speak of a single creator having a potential to create something complex, argued the atheists, then the whole idea of creation through a single creator could be dismissed as unworthy of further consideration.

The principal strategy used by the atheists in questioning the creator's potential to create was to point out that those who spoke of a single creator, usually called the Supreme Lord (*parameśvara*) or some similar term, usually regarded the Lord as eternal. That is, the Lord was supposed never to have come into being (either from nothingness or from some other state of being) and was also supposed not to be liable to stop being. It was also generally accepted that nothing could be eternal unless it was also simple. That is, all eternal things were supposed to consist of exactly one part that was quite uniform in nature, so that the whole was not in any sense different from its unique part. Being indivisible, simple beings were generally supposed to be either omnipresent or infinitesimal. Those who posited the existence of a Supreme Lord usually argued that he uniformly pervades all of space at all times.

A question that naturally arises about an eternally simple ubiquitous being is how such a being is supposed to act. The way this question was pursued is illustrated by how it was approached by the Buddhist philosophers Dharmakīrti (seventh century) and Śāntarakṣita (eighth century). They argued that action, as normally understood, involves undergoing some change of state. This change of state must be either a change in how the being in question is related to things outside itself, or a change in how parts within the being are related. The first kind of change, consisting of a change in relation to external things, normally involves some kind of motion, that is, a change in relative location over time. To a being that is everywhere all the time, however, motion is clearly impossible. This leaves internal change as the only remaining kind of change that a simple being might undergo. In the case of complex objects, internal changes of state are easily accounted for by referring to the gain or loss of parts, such as attributes, or to relational changes among the parts. It is, however, difficult to imagine just what kind of change of state is possible for a being that has only one part. And therefore it would appear that a simple being is not constituted in such a way as to have the potential for any kind of self-motivated action.

A second argument that atheists used in arguing against a supreme creator's potential to act in any way at all

involved asking the question of where the supposed potential might reside. There appear to be two possibilities. It could be that the potential is contained entirely within the being that has it, or it could be that the potential lies outside the being. If it were argued that the potential to act is entirely resident within a being, then it could be asked what it is that triggers this potential into actuality. If the potential were self-activating, then it would have to be activating itself at all times, for otherwise it would require something outside itself to make it active at some times but inactive at others. But a potential that is perpetually active is not a potential at all; rather, it is an actuality. Even if one were to hold the view that the Supreme Lord is perpetually creating the universe, this would not explain why he creates the world slightly differently from one moment to the next, thereby giving the appearance of change to his creation. It is better, argued the atheists, to abandon the supposition that the potential to create is contained entirely with the Supreme Lord. This leaves the possibility that the Lord's potential to perform the action of creation comes from outside, just as an inanimate body's potential to be in motion comes from outside itself. In that case, argued the atheists, we should not be able to say that it is God who performs the action of creating the universe, but rather that it is that which is external to God that is performing the creative action, and that this external agent is merely using God as an instrument in the action being performed.

2 A complex being's potential to decompose

Whereas a simple being is not composed of parts and therefore lacks the potential to go out of existence through the process of decomposition, a complex or composite being is liable to decompose. It was agreed among classical Indian philosophers that complex objects are subject to destruction through decomposition. Where there was controversy was over the issue of how this decomposition comes about. In particular, there was controversy over whether the destruction of a complex thing requires a separate external cause to bring it about or whether complex things have an innate tendency to go out of existence spontaneously.

The position that complex things have an innate tendency to cease to exist was held by several Buddhist scholastics, such as Vasubandhu (fourth or fifth century), Dharmakīrti, and Śāntarakṣita. Taking as their point of departure the Buddha's observation that all composite things are impermanent, the Buddhist scholastics grew increasingly committed to the view that all composite things are momentary, that is, that all complex beings perish in the very moment in which they arise (see Momentariness, Buddhist doctrine of).

Among the arguments that were used to defend this doctrine, one was based on an analysis of potentiality. Vasubandhu argued that if a given complex being were capable of remaining unchanged for two consecutive moments, then there would be no reason for it ever to undergo change. Suppose that a being had a certain set of properties in one moment and then had exactly the same set of properties in the subsequent moment. One might ask whether among those properties the potential to perish was to be found. If not, then the complex being would have no potential to perish and therefore would be eternal. But even if the potential to perish were among the properties of the complex being, the question would still remain of how that potential is actualized. If the potential is self-activating, then it must activate itself in each moment of its existence; but if the potential to perish is realized in each moment of a thing's existence, it follows that the thing exists for no more than one moment.

This conclusion that things perish in the very moment in which they arise is quite contrary to how things are experienced. In our experience of things, it seems that complex objects endure for a period of time and then go out of existence as a result of being acted upon by some destructive agent. A piece of wood, for example, continues to exist unchanged until it comes into contact with fire, which is the cause of the wood's destruction. One might ask why we should not take our experiences of these events at face value. In addressing this question, Vasubandhu points out that in fact we do not directly experience the destruction of the wood by the fire. What really happens is that we see the wood, then we see the fire, and then we no longer see the wood. It may be tempting to explain this sequence of events by saying that the presence of the fire causes the disappearance of the wood, but it would be a mistake to claim that one actually observes the causal process of destruction at work. Indeed, argues Vasubandhu, it is impossible to observe fire destroying a piece of wood; if the fire and the wood are observed to exist at the same time, then it is obvious that the existence of the fire is not a cause of the absence of the wood, for the simple reason that the wood is not absent. On the other hand, if the wood is present in one moment and absent in the next, fire existing where the wood used to be, then one might say that the wood was replaced by flame. Seeing one thing replaced by another, however, is not the same as seeing the subsequent thing destroy the former thing. After considering various other dimensions of this problem, Vasubandhu finally concludes that the problem of what

causes the absence of a thing is one that arises only when one assumes that absence itself is an entity and therefore must have a cause. If, however, it is recognized that absence is not itself a thing, then it is clear that absence cannot have a cause, for only things have causes. Once it is recognized that there is no such thing as the cause of an absence, the question of how a potential cause of absence is actualized ceases to have any meaning.

3 A person's potential for cultivating virtue

The question of how a complex thing was supposed to become absent was not merely an issue for intellectual debate. An issue underlying this discussion was the question of whether certain vices, seen as responsible for keeping a person bound in the cycle of rebirth, required a special cause, such as human effort, to eliminate them. A representative account of the mechanism of karma and rebirth is that of Vasubandhu. According to his *Abhidharmakośa (Treasury of Abhidharma)*, a decision to act in a particular way has several consequences, one of which is a predisposition to act in a similar way in the future. If, for example, one acts with the intention of injuring another, then making the decision to injure others will be that much easier to make in the future. An action, in other words, creates a latent predisposition, which in turn is a factor in creating a future action. A being who is caught in the round of rebirths is captured in that cycle as a result of various kinds of latent predisposition, the most important being the predisposition to pursue sensual pleasures, to dislike sources of displeasure, to have a tenacious belief in a permanent self, and to hold on to dogmas that legitimate one's choices of action. These predispositions are all regarded as potentials. Therefore, the question arises as to how their potentiality is activated. Moreover, each of these potentials can be seen as a complex thing that therefore has the potential to decompose. Here the question is whether the potential to degenerate requires an external cause. Does it take work to rid oneself of a bad habit?

Vasubandhu's response to this question is that it does not require special effort to rid oneself of a habit; rather, it takes work to keep the habit intact. It takes effort to keep oneself habituated to seeking pleasures and holding onto dogmas. What takes no effort is to let go of these habits. If one stops making the effort necessary to reinforce a bad habit, it will eventually dissipate through its own potential to perish. For this reason, most of the specific precepts of the spiritual life are negative in character: avoid killing, avoid theft, avoid sexuality, avoid lying and avoid intoxicants. Moreover, the most effective forms of meditation consist in simply noting what mental states are present and making no effort either to pursue them or avoid them. If simply noted but not acted upon, one's urge to kill or to make a scathing remark will perish by itself without creating a karma. By not creating a karma that reinforces the habit to act malevolently, one eventually becomes free of the malevolent habit and of the views necessary to justify acting on those habits.

Several schools of Hindu religious philosophy, and one strand of the Yogācāra school of Buddhism, asserted the view that every sentient being possesses a potential for wisdom. This wisdom was seen as something positive and not merely as the absence of vices and misconceptions, and therefore the potential to make one wise must also be seen as positive. As in other discussions of potentiality, a question that arose was how this potential for wisdom can be activated. One of the answers was that the potential is in fact activated at every moment; in other words, every sentient being is indeed wise in its truest nature. The apparent lack of wisdom in some beings, or lapses of wisdom in beings who are normally wise, can then be accounted for not as an actual lack of wisdom but as an occultation of actual wisdom. In other words, a being's innately radiant, blissful and virtuous nature is concealed by the darkness of a transitory episode of ignorance or vice. This position, of course, gives rise to the question of how the ignorance or vice comes into being and to whom it belongs if not to the innately wise mind itself. Śaōkara's famous answer to this riddle was to reply that the question arises only from the perspective of ignorance, and since ignorance is ultimately illusory, there is not really a riddle here in need of an answer (see Śaōkara).

4 The potential of a sound to convey a meaning

From the earliest times, Indian theorists of language were intrigued with the potential or power that language has to evoke images and emotional responses in the mind of the hearer. It was generally recognized, however, that this potential cannot reside entirely within the sounds themselves, since a person unfamiliar with a language will not have appropriate intellectual and emotional responses to the sounds heard. Grammarians and poeticians both observed that a verbal performance, such as a poem, only had its effect when it was heard by a cultivated intellect; generally speaking, the more learned and sophisticated the intellect of the hearer, the more richness the poem yielded. This was said to be true of all language, but was especially important for the religious poetry of the Vedas.

A phrase of revealed Vedic poetry spoken in the context of a ritual performance was known as a *mantra*, and *mantras* were supposed to have a power not only to convey meanings, but to influence physical events. The power of a *mantra* was said to be at its maximum when pronounced by a priest who had a perfect understanding of the Vedic Sanskrit language. This fact was enough to make Buddhist and Jaina philosophers question whether the power of language was a feature of the sounds themselves, as Brahmanical thinkers claimed. Buddhists and Jainas were also dubious about the claim that Sanskrit had a power greater than any other language to evoke meanings and emotions, arguing instead that whatever language the hearer knows most intimately is most meaningful to the hearer; this would suggest that the potential resides not in the sounds but in the community of people who know a language.

One further controversy debated by Indian theorists of language had to do with how the potential to convey meaning was located in a sentence, and what role the individual syllables played. Some argued that each syllable has its own independent potential and that the sentence's potential to convey meaning is the sum of the potentials of the syllables. Others argued that the sentence as a whole has a potential, and the function of the syllables is merely to make that potential fully realized for the hearer. According to this view, even if only the first syllable of a sentence is spoken, the sentence as a whole still has its full meaning-bearing potential, but the hearer receives only a partial glimpse into what that meaning might be.

Pothier, Robert Joseph (1699-1772)

Robert Joseph Pothier was one of the most influential of modern civilian jurists. At the end of a long period of rationalistic natural law thought, he produced a rational reconstruction of the civil law on the basis of which the transition from law as reason based on custom to law as product of the rational legislative will could be accomplished.

By his work in the systematization first of Roman law and subsequently of French customary law, Pothier cleared the way for the codification of French Law under Napoleon in the early nineteenth century. Born in Orléans of a family with a long tradition of service in the magistracy, he served most of his life as a magistrate in Orléans, becoming also a professor in the University of Orléans after publication of his first main work, which was a reconstitution of Justinian's *Digest* aimed at clarifying the underlying conceptual framework (see Justinian). This was the result of long and profound studies in Roman law (see Roman law §2). In each title he rearranged the materials, without further textual alteration, to reveal what he conceived to be the logical order underlying them.

Following upon this, he turned his attention to French law, which at that time was a patchwork, in the north based on various differing local customs according to different court districts, in the south on a partly modernized version of Justinianic civil law. He published a text on the customary law of Orléans, pointing out its variations from and similarities with other customs of different court jurisdictions in the north. Applying his rationalistic principles, Pothier then turned to a statement of the principles of law that in his view underlay both written and customary law in crucially important fields. His most notable contribution was his *Treatise on Obligations*, expounding general principles of contract-formation and contractual liability. This quickly achieved recognition inside and outside France, being translated into English in an American and a UK version in the early 1800s. It was followed by a series of works on more particular contracts, and then by work on matrimonial property and on marriage, interpreted as essentially a civil contractual obligation to which Church authorities also gave recognition, rather than as an essentially ecclesiastical or religiously-grounded institution.

In France, Pothier's influence was enormous, in that he provided a basis on which the compilers of a civil code could work when, in the circumstances of revolution, the idea of the rule of law was conceptualized as requiring abandonment of obscure customs expounded by judges, instead calling for their replacement with rationally ordered and duly published statutes (see Rule of law (Rechtsstaat) §1). In the common law world, then also engaged in a prodigious effort of rationalization, his work was scarcely less influential, as the common law struggled to produce out of materials based on pre-modern forms of action a rational law of contract fit for an industrializing and commercializing society. Thus did natural law ideas, such as Pothier's, create a rational structure of legal concepts that more positivistic successors could adopt.

Pound, Roscoe (1870-1964)

Roscoe Pound was a legal thinker who exercised profound influence in the USA in the first half of the twentieth century. The approach he advocated, under the banner 'sociological jurisprudence', was to present law as essentially an instrument for the pursuit and reconciliation of human interests.

Long-term Dean of the leading law school, Harvard, Pound played a prominent role in defining the dominant approach to understanding and teaching law for twentieth-century Americans. To understand any body of law, he argued, one must understand what interests it serves, and must be careful to discriminate different types of interest. Some interests are individual, like the interest of each person in their own life and health; some are social, like the interests of a society in controlling the spread of infectious diseases; others are public, like the interest of the state in the health and fitness of citizens eligible for military service. The tasks of law-making and of judging are tasks of balancing and harmonizing actually or potentially conflicting interests, with a view to maximizing interest-satisfaction at the lowest possible cost in frustration of other interests. Hence law can be considered 'a continually more efficacious social engineering'.

Pound's is thus an optimistic as well as an instrumentalist view of law. His upbringing and education in Nebraska, his early training as a botanist and his work on the flora of Nebraska, followed by experience as legal practitioner and pro tem judge in his home state, no doubt contributed to the progressivism exhibited in the sociological jurisprudence he developed as a professor called back east to the Harvard Law School. His scientific training is doubtless also reflected in the care he took over working out a complete taxonomy of the interests he could detect as being served by the law. Significant here also is his typology of 'individual', 'social' and 'public' interests, and his attempt to map the connections and differences between them. Also important is his insistence that in a process of balancing, like must be compared with like, and interests should be brought within the same type before balancing can be properly carried out. Recognition of some interests as irreducibly social or irreducibly public marks off his theory from classical utilitarianism, to which he has obvious affinities. In trying to develop a distinctive 'jurisprudence of interests', he had predecessors such as the German jurist Rudolf von Jhering.

Pound engaged in polemics with 'American realism' (see Legal realism §2), arguing for what he saw as a rational approach to legal studies, rather than exaggerating law's indeterminacies, as he thought the realists did. His own theory suffered at the hands of sociologists and others who challenged his belief in the essential harmony of interests despite class and other divisions in society. His vast five-volume statement of his jurisprudence is so ponderous as to be nowadays little read; his shorter, more introductory, writings retain far greater interest and vitality. He is a significant figure among 'legal instrumentalists' in US intellectual history, but has little direct influence at present.

(1982) *Instrumentalism and American Legal Theory*, Ithaca, NY and London: Cornell University Press.(Outstanding account by a leading US jurist of the various strands in the school of thought to which Pound belonged, providing a clear view of Pound’s work in its context, and of his place in US thought.)

Power

The general notion of power involves the capacity to produce or prevent change. In social and political philosophy, narrower conceptions of power specify the nature of these changes. Social power is the capacity to affect the interests of agents. Normative power is the capacity to affect their normative relations, such as their rights or duties.

There are long-standing conceptual disputes about the nature of power. Some emphasize the role of actual or potential conflicts of interest in defining power relations, others take legitimacy and consensus about norms as the basis. There is also a dispute, involving the nature of social explanation, about whether power must rest with agents or with social structures or forces of some kind. The lack of consensus on these matters raises the overarching question of whether the concept of power, which seems to function as a descriptive term, in some way involves evaluation.

1 Social power and interests

In social and political theory, ’power’ is sometimes used wherever causal language is appropriate. We may thus speak of the power of incentives in the labour market or the power of socialization in child development. This may prompt the thought that power is everywhere and beyond escape. (Michel Foucault sometimes makes such promiscuous use of the term; see, for example, Foucault 1980.) But to identify social power with causal power is to abandon a helpful concept, for there are theoretical and practical interests in distinguishing among the causal processes in social life.

Many views delimit social power by reference to a significant capacity to affect people’s interests. (The question whether such power is better thought of as a resource or a relationship is somewhat artificial: it is both.) Hobbes (1651) said that power is one’s ’present means to obtain some apparent future good’, and thought the endless struggle for power an ineliminable part of human nature. The implicit reference to social conflict is made explicit in Max Weber’s definition of power as: ’the probability that one actor within a social relationship will be in a position to carry out his own will despite resistance, regardless of the basis on which this probability rests’ ([1922] 1968: 53).

What role do conflicts of interest have in power ascriptions? Steven Lukes (1974) has vigorously argued that since the most insidious and effective forms of power are those that affect people’s conceptions of their interests, power is more than the capacity to influence overt decision making, and more than the capacity to control which issues reach the public agenda; it also includes the capacity to influence how people perceive their own interests. Thus, power may be present even in the face of apparent consensus. To identify such power, however, requires a view of interests that is objective in the sense that it is independent of the actual beliefs and desires of the subjects (see Needs and interests).

Critics have wondered whether such a notion is very useful in descriptive and explanatory research (see §4). Perhaps a deeper worry, however, is whether ’objective interests’ can be defined independently of power, for it seems natural to say that objective interests are those interests people would have if they were not constrained by power relations (Kernohan 1989). Moreover, both Weber’s and Lukes’ theories seem guided by the idea that power affects people to their detriment. Does this mean that justified acts of paternalistic control cannot be exercises of power? This suggests that although social power involves the capacity to affect the interests of people, it is to be identified less by its actual or intended ends than by its means, such as coercion or manipulation. While we may allow that such means are *prima facie* detrimental to people’s interests, they need not be so when all things are considered.

2 Normative powers

Normative powers (for example, the power to promise or to command) involve the capacity to change normative relations: to create, extinguish or vary people’s rights and duties. The relevant relations may be a matter of law, morality or social convention.

Some maintain that all normative powers may be reduced to powers to impose or remove duties which may in turn

be reduced to direct or indirect threats of force. Each step of this reduction may be challenged - especially the second, which cannot account for the fact that people often recognize duties that they think neither will be nor should be enforced. Reductivist accounts, however, continue to be influential among sociologists who incline to a ‘realistic’ view of power.

The concept of normative power is important in legal philosophy, but some have also adopted it as the paradigm for political power in general. Hannah Arendt’s quirky definition makes sense in this light: ’Power corresponds to the human ability not just to act but to act in concert. Power is never the property of an individual; it belongs to a group and remains in existence only so long as the group keeps together’ (1970: 143). Her idea that power rests on accepted norms that constitute a group and that precede all instrumental reasoning about what the group should do is inspired by a particular account of what it is to be ’in power’ (see Arendt, H.). Similar thoughts underpin Talcott Parson’s idea that power is a ‘generalized medium of mobilizing commitments or obligation for effective collective action,’ a ’generalized facility or resource’ that rests on accepted norms of legitimacy (1967: 331). Focusing in these ways on norm-constituted capacities emphasizes consensus as opposed to conflict, which for Arendt is instead a matter of ’strength’ or ’violence’ and for Parsons ’force’ or ’coercion’. It also assimilates political power to authority, which is one of the most important normative powers (see Authority).

Since normative power affects people’s interests, it does fall under the general concept of social power. It is worth distinguishing, though, because of the way beliefs about legitimacy and norms mediate its effects. This partly explains why these theories make power relations seem less asymmetric than do Hobbesian or Weberian theories. To suppose that A has social power over B in respect of X often suggests that B does not have that same power over A in that same respect. But whether A and B mutually have the power to rule depends on the actual norms accepted in that society: these powers may be fully symmetrical.

3 Problems of agency

If power is a capacity to produce or prevent changes, in what does that capacity rest? Many assume that it must rest in individual or corporate agents. This is obvious in the case of normative power; but it is also implicit in the accounts of social power examined in §2, and explicit in Bertrand Russell’s (1938) definition of power as ’the production of intended effects’. Even if one may exercise power unintentionally (for example, recklessly), only things with the capacity for agency can exercise power at all.

Others hold that social power rests in non-agential things called social ’structures’ or ‘forces’. For the Marxist philosopher, Nicos Poulantzas, individual agents are but the locations or ’bearers’ of such forces, and power is ’the capacity of a social class to realize its specific objective interests’ (1973: 104). This view has been criticized by Ralph Miliband (1969, 1970), who holds that political agents retain at least a relative autonomy from class structures. At bottom is a deep dispute about the cogency of determinist explanations for social change.

Michel Foucault’s later writings suggest another non-agential view of power (Foucault 1978, 1980). First, he expands the relevant power structures to include realms of professional and scientific discourse. At its most extreme, this allows no distinction between claims to knowledge and bids for power. Second, such power creates agents: it is ’productive’ and not merely ’repressive’. On this view, naming, classifying or diagnosing people, literally creates criminals, the insane, homosexuals, and so on (see Foucault, M.).

It may be wondered whether this view is coherent. Whether or not the theory abstains from using the word ’knowledge’ or claiming truth for itself, it none the less purports to have some sort of warrant which, on its own terms, must be understood as a bid for power. This is pragmatically self-defeating. Second, the productive thesis elides a distinction between the literal production of agents and the production of a sense of identity on the part of pre-existing agents. (So while, for example, homosexuals may not have been created in the nineteenth century, an emergent gay identity may have been.) But the general notion that social power may affect not only one’s conception of one’s interests, as Lukes says, but also one’s conception of oneself as an agent capable of having interests, is an important deepening of that line of thought, and one independent of the more radical Nietzschean themes in Foucault’s work.

4 Power and values

Power seems to function as a descriptive term. In certain limited contexts (for example, in bargaining theory or

voting theory) it has proved possible to specify measures of power, and in the social sciences there are distinguished empirical studies of the bases of power. But in spite of this conceptual controversy persists, and not only over borderline cases, but also over what should be taken as paradigm cases of power. This may suggest that power is an ‘essentially contested concept’, disputes about which are fundamentally moral or political and which preclude resolution (see Political philosophy, nature of §3).

There are a number of sources of controversy here, and they need to be distinguished. First, referring as they do to causal capacities, power ascriptions inherit all the philosophical difficulties of causal language and, in particular, the difficulties of interpreting and evaluating counterfactual conditionals (see Counterfactuals; Causation). Second, as we have seen, accounts of social power also inherit disputes about the nature of human agency and interests (see §2). Third, power ascriptions are shaped by the practical point or purpose in making them. One influential view, advanced by Lukes (1974) and by William E. Connolly (1974), is that power is ascribed to fix moral responsibility: those with power are those who should change things. This raises further questions: does responsibility require intentional action, or are recklessness or even just negligence enough?

This thesis must, however, be framed with care. First, even if there is a link between power and responsibility, it does not follow that to say ’A has power over B’ is to make a moral judgment about A’s blameworthiness, for A may have a justification or excuse for acting or failing to act. Second, lacking the power to change something may itself be an excusing factor, on the principle that ought implies can. If that is so, then it must be possible to make some power ascriptions independently of the relevant judgments about responsibility.

Moral values are not, in any case, the only way in which we might delimit the field. Power ascriptions are part of a larger social theory, so there are also theoretical values such as simplicity, fecundity, coherence, and so on, to be considered. Moreover, although views about the nature and importance of certain human interests also guide concept formation, this need not involve any moral appraisal or prescription. To say that money traders have great social power is to think certain effects more important than others because of their links to central human interests; but it is not directly to assign moral praise or blame. We should not confuse the plausible claim that all descriptions are value-laden, with the stronger and dubious claim that all descriptions are morally fraught.

Practical reason and ethics

Practical reason is reasoning which is used to guide action, and is contrasted with theoretical reason, which is used to guide thinking. Sometimes 'practical reason' refers to any way of working out what to do; more usually it refers to proper or authoritative, hence reasoned, *ways of working out what to do.*

On many accounts practical reasoning is solely instrumental: it identifies ways of reaching certain results or ends, but has nothing to say about which ends should be pursued or which types of action are good or bad, obligatory or forbidden. Instrumental reasoning is important not only for ethics and politics, but for all activities, for example, in working out how to travel to a given destination.

Other accounts of practical reason insist that it is more than instrumental reasoning: it is concerned not only with working out how to achieve given ends, but with identifying the ethically important ends of human activity, or the ethically important norms or principles for human lives, and provides the basis for all ethical judgment.

No account of objective ethical values can be established without showing how we can come to know them, that is, without showing that some form of ethical cognitivism *is true. However, ethical cognitivism is not easy to establish. Either we must show that some sort of intuition or perception provides direct access to a realm of values; or we must show that practical reasoning provides less direct methods by which objective ethical claims can be established. So anybody who thinks that there are directly objective values, but doubts whether we can intuit them directly, must view a plausible account of practical reason as fundamental to philosophical ethics.*

1 Introduction

Most ethical positions or theories rely on one or more conceptions of practical reason, yet many fail to explicate, let alone to vindicate, the particular conceptions on which they rely. The only positions or theories which offer no account of practical reason are those which construe ethical claims either as noncognitive or as based directly on particular cognitions such as perceptions or intuitions that do not need to be linked to any reasoning process (see Analytic ethics; Emotivism; Intuitionism in ethics; Moral realism).

One pervasive disagreement among the proponents of various accounts of practical reason is between those who think that practical reasons should both justify and motivate action and those who think that they should justify, but need not motivate. The claim that reasons both justify and motivate is often labelled *internalism*, the thought being that anything that motivates (whether a desire, or a certain sort of belief, or some other internal state) must be internal to the agent who is motivated. The claim that reasons must justify but need not motivate is correspondingly termed *externalism* (see Moral motivation §§1-2). Broadly speaking, internalists think that externalists fail to show how reason can be practical, since they do not adequately address the question of motivation, and externalists think that internalists lose sight of the fact that practical reason must be reasoned, since they build an account of the contingencies of motivation into their account of reason. There are many versions both of internalism and of externalism.

Accounts of practical reasoning can be grouped under two very general headings. Many accounts of practical reason are *end-oriented* (also known as *teleological* or *consequentialist*): they seek to show how reason can select action (also attitudes and policies) that will contribute to certain ends or results (see Consequentialism; Teleological ethics). Many proponents of end-oriented practical reasoning think that practical reason can do no more. Since no objective account of the proper ends of human life can be found, we must settle for *subjective* accounts of human ends. We must agree with Hume that reason 'is, and ought only to be the slave of the passions' (Hume 1739-40: 415) (see Rationality, practical §1). However, there are other accounts of end-oriented practical reasoning which insist that reason can also identify certain *objective* ends, and so has the dual task of identifying the proper ends of action and guiding action towards those ends.

Yet other conceptions of practical reason do not view it as focused solely on ends and means to those ends. *Act-oriented* accounts of practical reason take it that action (also attitudes and policies) are guided by norms or principles, and that it is the task of practical reason to identify appropriate, reasoned norms and principles. Some norms and principles formulate very general ends, others point to quite specific acts: the Jesuit maxim 'For the greater glory of God' defines the end of an entire life; the homely advice 'Do not eat oysters unless there is a letter

"r" in the name of the month' offers limited and specific advice. Although some norms and principles define ends, norm- and principle-guided reasoning cannot be assimilated to end-oriented reasoning, which sees all practical reasoning as bearing on a means-ends complex. Act-oriented reasoning sees it as bearing on practical propositions (norms, rules, principles) and as guiding action without reference either to supposed objective ends or to the subjective ends of any agents.

Many accounts of act-oriented reasoning see it as norm-based: they take it that the fundamental ethical orientations (norms, categories, commitments, beliefs, senses of identity: hereafter *norms*) accepted in a society or tradition, or in an individual's life, provide the fundamental premises for practical reasoning. On such accounts, practical reasoning is internal to societies: it appeals to the norms that constitute the bedrock of certain lives or ways of life, so cannot coherently be brought into question by those who live these lives.

Other critical accounts of act-oriented ethical reasoning object that uncritical appeal to accepted norms cannot provide acceptable premises for practical reasoning; arguing from accepted norms is quite arbitrary, hence quite unreasoned. Any conclusions reached in this way will be relative to the assumed norms, so can support no more than one or another version of ethical relativism (see Moral relativism). Exponents of critical accounts of practical reason think that adequate act-oriented reasoning must offer reasons which do not presuppose any specific norms (or traditions, or identities), but rather must be public in the sense that they are relevant to an unrestricted audience, or, as Kant put it vividly in an early version of this thought, that they must 'address… the world at large' (1784: 57). The possibility of vindicating any critical, universal conception of act-oriented practical reason is questioned by proponents of other conceptions.

The search for a convincing account of practical reason raises issues fundamental not only to ethics and politics, but to a wide range of philosophical problems. They include the problem of seeing whether, and if so how, any account of practical reason can be vindicated without begging questions, the connection between practical and theoretical reason and the problem of showing how and how far various conceptions of practical reason can guide action, attitudes or policies.

2 End-oriented reasoning: reason is instrumental

Scepticism about the idea that reason has any objective ends of its own was put succinctly by Hume, who scoffed that ''tis not contrary to reason to prefer the destruction of the whole world to the scratching of my finger' (1739-40: 416), insisted that ''tis in vain to pretend, that morality is discover'd only by a deduction of reason' (457) and concluded that *ought* cannot be derived from *is* (469). If morality has no ends that are discovered by reason, then practical reason's only task is to show how the pursuit of the passions - of subjective ends - is to be organized effectively and efficiently. The central task of practical reason is the instrumental one of deploying our knowledge of causal relations to guide action: practical reason is simply an application of and derivative from aspects of theoretical reason; it needs no separate justification.

There is, however, a great deal to be said about the detailed operations of instrumental reasoning. In particular, if some metric can be found for the ends which are to be sought (for example, if there is a metric for the satisfaction of desires or preferences), and if the probabilities of achieving various ends can be quantified, then instrumental reasoning can be used to show which available actions maximize the satisfaction of preferences, and hence how given ends can be pursued efficiently. If this metric permits the desires or preferences of different persons to be measured using a common unit, practical reasoning may be able to guide social as well as individual decision-making and policy. Utilitarian ethical theory, game theory and a wide range of economic and social calculi have discussed numerous versions of subjective, end-oriented practical reasoning which are held to be appropriate for various contexts (see Rationality, practical; Rational choice theory; Utilitarianism.)

Merely instrumental accounts of practical reason have been criticized at least since Kant. The critics do not doubt that instrumental reasoning is a necessary aspect of practical reasoning, but they insist that it cannot be sufficient. All that it provides is an account of the use of empirical, and in particular causal, knowledge in pursuit of intrinsically arbitrary ends. Instrumental reasoners may show that it is necessary to break eggs if one wants to make an omelette, but they have nothing but preferences to cite as reasons for making or not making omelettes: all their conclusions are conditional on subjective ends. Instrumental reasoning in pursuit of individual preferences can support efficient egoism, or strategic thinking or certain limited and distinctively modern conceptions of

prudence: but this is all it can do (see Moral motivation §§4-6; Prudence §2).

Contemporary work on instrumental reasoning has addressed this criticism up to a point by insisting that practical reasoning requires not only that choices of action be instrumentally sound, but that they be based on well-ordered (for example, connected and transitive) preference-orderings. However, since these coherence conditions can be met by many different sets of preferences, the requirement of well-orderedness provides little further reasoned guidance. It does not add enough to an account of instrumental rationality to satisfy those who think that an account of practical reason should provide a more complete guide to reasoned choice, or to rebut the charge that instrumental reasoning gets no further than showing how intrinsically arbitrary (unreasoned) ends are to be pursued by rational means.

Some advocates of subjective end-oriented practical reasoning have held that desires and preferences, although subjective, provide an approximation to an objective account of the good. Some utilitarians, for example, have held that happiness is the sole good, that it is achieved by satisfying desires, and that therefore the optimal satisfaction of desires leading to maximal happiness produces the greatest good; they then claim that instrumental reasoning provides a sufficient account of practical reasoning for ethical as well as for egoistical, strategic and merely prudential purposes. Critics have countered that happiness is not the sole good, and moreover that it is not all of a sort, and cannot be aggregated, so that instrumental reasoning alone will not be enough to guide ethical choice. Others have objected that some sorts of happiness, such as happiness in the satisfaction of evil desires, or happiness produced by violating others' rights, does not contribute to the good at all, and conclude that instrumentally rational pursuit of happiness cannot be what ethics demands.

3 End-oriented reasoning: reason identifies objective ends

All of these difficulties would be resolved if reason could also identify objective ends. Instrumental reasoning is only one aspect of an older and more ambitious conception of end-oriented practical reasoning, which claims that reason both identifies the proper ends of action - the good - and can be used to steer action towards those ends. Such a position can be attributed to Plato, on whose account reason not merely can know its proper object, the [Form of the] Good, but strives for the Good. Far from being inert, reason is intrinsically active, has its own desires and its own end. In this picture there is no gap between theoretical reason, which guides right cognition, and practical reason, which guides right action. Human knowledge and desire have a common focus on the Good; *nous* and *eros* are aspects of one capacity, and the remaining practical problem is to align human life as that capacity directs (see Frede and Striker 1996).

The metaphysical and epistemological claims needed to support this more traditional vision of practical reason are hugely ambitious. Yet despite the difficulty of justifying objective conceptions of end-oriented practical reason, it has been widely accepted in varied forms. Aristotle, for example, took issue with Plato's unitary conception of the Good, and insisted that there are many goods, but held that they include the Good for man, which constitutes the proper end for human action (see Aristotle §§20-1; Eudaimonia). He offers a complex account of supplementary patterns of practical reasoning which can be used to identify action that contributes to the good for man. These include the *doctrine of the mean*, which purportedly offers a nonmechanistic way of selecting 'intermediate' action, so avoiding unacceptable extremes, and the so-called *practical syllogism*, by which conclusions about action (or possibly actions themselves) are inferred from general principles and claims about particular situations (see Anscombe 1957). Many later Neoplatonist and Christian thinkers also combine the ideas that the Good can be known by reason and that it is the proper end of human life. Plato's teleological view of reason has been widely if tacitly shared by countless other writers who neither share his metaphysical position nor provide any alternative, but who speak of certain ends as 'reasonable' without much by way of explanation, and often with far less by way of defence than Plato offers.

Of course, knowing what the Good is - what the true ends of human life are - is never enough to guide action. The effective pursuit of these ends also requires the use of reason to calculate which of various available acts contributes to those ends most effectively, as well as to identify any actions, attitudes or policies that are components of those ends. However, by itself this calculating, predominantly instrumental, side of end-oriented practical reason, as discussed in §2, cannot guide action without assuming subjective ends.

4 Act-oriented reasoning: reason appeals to norms

Other accounts of practical reason hold that it must guide action without reference either to subjective ends (because its conclusions would then be conditional on something wholly arbitrary) or to objective ends (because there is none). An adequate account of practical reason must bear more directly on action, and more specifically on the practical propositions (norms, rules, principles) which agents follow or embody in their lives. Just as theoretical reasoning prescribes ways of moving between elements that have syntactic and semantic structure, so too must practical reasoning. The central problem in using any act-oriented conception of practical reason for ethical purposes is to show *why* some but not other norms or principles, and so some but not other types of action and ends, attitudes and policies, are either good or ethically required.

Many forms of act-oriented practical reasoning maintain that the basis for distinguishing certain types of action from others can be found in the categories, beliefs and norms that form the constitutive elements of a society or of a sense of identity. These constitutive norms cannot be brought into question by anyone for whom they constitute the horizons of life and thought, so can provide basic premises for reasoning about what is good or bad, required or forbidden.

Once some fundamental norms have been identified, practical reasoning can be extended both by instrumental reasoning and by analysing the logical connections and implications between different norms (for example, between requirements, prohibitions and permissions) and the structure of systems of norms. At its most formal this sort of analysis draws on deontic logic; less formal conceptual investigations of types and systems of rules have also been undertaken, particularly by philosophers of law (see Deontic logic; Legal reasoning and interpretation) (see Raz 1975; Schauer 1991). However, since act-oriented practical reasoning does not provide any metric for ends it cannot use the maximizing patterns of practical reasoning which some subjective forms of end-oriented reasoning favour.

Norm-based practical reasoning is uncontroversially part and parcel of daily life, but philosophical argument that it is the basis for all ethical reasoning is highly controversial. Arguments that all ethical reasoning appeals to norms can be found in the work of Hegel, in historicist, communitarian and relativist writing, and (in more individualistic forms) in work by Wittgensteinians and by Bernard Williams.

Hegel's view that there is no gap between *is* and *ought* expresses not the implausible thought that whatever is accepted is acceptable, that (contrary to Hume) *ought* can be generally be derived from *is*, but the more profound view that all thinking and action must grow not out of abstract theories and principles but out of the deep structures of our actual situations (Hegel's term is *Sittlichkeit*, often translated as *ethical life*) (see Hegel, G.W.F. §8). The deep facts of our histories and lives are ones that we cannot 'go behind' and bring into question; rather they form the inescapable framework of our action, so constitute legitimate, indeed unavoidable, starting points for all practical, including ethical, reasoning.

Similar positions can be found in Wittgenstein and in certain Wittgensteinians. In Wittgenstein's assertion that 'there must be agreement… in judgments' (1953: paragraph 242) and in the widespread view that certain issues are 'not a matter for decision' (see Winch 1972), we see further versions of the thought that certain categories and norms form inescapable frameworks for life and thought, and that those who live within them lack any external vantage point from which to question or undermine them (see Wittgensteinian ethics). More individualistic versions of the same approach can be found in Bernard Williams' contention (1976) that certain identity-constituting personal projects and commitments are part of the framework which reasoning must assume, so cannot query (see Morality and identity §4).

Practical reasoning which appeals to constitutive norms, coupled with ordinary patterns of instrumental reasoning, has powerful means of guiding action at its disposal. Critics fear, however, that this power is bought too dearly. One alleged cost is that norm-based practical reasoning is supposedly conservative: it will always already have presupposed established (usually establishment) categories, norms, identities and commitments, and provides no vantage point from which they can be criticized. This criticism is rebutted by many proponents of norm-based reasoning who, like Hegel, point out that any constitutive norm, sense of identity or the like will be but part of a wider set of beliefs and norms, whose elements can be used to challenge, revise and renew one another (see MacIntyre 1981). Once norms and identities are seen in developmental, historical context there is no reason to suppose that practical reasoning that starts from those of a given place and time must be intrinsically conservative.

Perhaps a more worrying criticism of norm-based practical reasoning is that even if it is not intrinsically conservative, it is nevertheless unavoidably designed for those who have internalized a certain outlook and its categories and norms: it is insiders' reasoning. For outsiders, treating insiders' shared categories and norms, and the established practices and identities they support, as bedrock for practical reasoning lacks all justification, because it adopts arbitrary premises. Like instrumental reasoning, norm-based reasoning can at best reach conditional conclusions. Its advocates can only retort that there is no external vantage available from which these starting points can be rebutted or called into question.

5 Act-oriented reasoning: reason appeals to 'the world at large'

If act-oriented reasoning is to escape the confines and the criticisms which it incurs by treating socially specific categories and norms as the bedrock for ethical reasoning, then it must find some way of 'going behind' and criticizing these assumptions.

The classic version of a critical conception practical act-oriented practical reasoning was developed by Immanuel Kant, who held that reasoning should address 'the world at large' (that is, all reasoners) rather than the limited groups who share specific but intrinsically arbitrary norms and practices (see Kant 1784, 1786; O'Neill 1989 part I, 1992). If practical reasoning is to meet this standard, its first requirement must be the rejection of any principles which cannot be adopted by all, regardless of their social background, their accepted categories and norms, their established practices, their senses of identity or their desires (see Universalism in ethics §§1-2, 5). Kant summarized this requirement in the words: 'Act only on that maxim through which you can at the same time will that it should be a universal law' ([1785] 1903: 421). He claims that this principle of practical reason provides the supreme principle of morality, and should be called the 'categorical imperative' because it is the only way of reasoning practically which does not introduce arbitrary assumptions, and so the only one that can reach unconditional, namely categorical, conclusions. The component norms of social traditions and senses of identity may be scrutinized using the categorical imperative; if they cannot be willed as universal laws they must be rejected as unreasoned.

Kant's attempt to vindicate this critical account of practical reasoning is based on the thought that anything which deserves to be called reasoning must be something that can be given or received, exchanged or followed, among the widest 'public', that is universally, and correspondingly that anything which invokes the norms and beliefs of limited groups, let alone the favoured projects of individual lives, calls for rather than provides reasons. The authority of reason is simply the requirement of living by fundamental principles that are fit for universal use (in other words, that are *lawlike*). Since we know no intrinsic sources of authoritative standards - we have no account of the objectively good - the only meagre authority with which we are left is the injunction to reject principles which cannot be principles for all.

Once this fundamental use of practical reason has been used to identify certain core ethical principles or rules, critical practical reasoning can be extended by some of the moves used by instrumental and norm-based practical reasoning. Kant insists that instrumental reasoning is indispensable (although he cannot reinstate the metric assumptions or maximizing calculi advocated by those who hinge reasoning on subjective ends). He speaks of instrumental reasoning as guided by the principle of the 'hypothetical imperative', since by itself it can only licence conditional conclusions. His full account of practical reasoning also relies on the transitions between different modalities of required action (for example, between claims about obligations, permissions and prohibitions) that are used in norm-based reasoning.

There are many passages in which Kant indicates that the principles of theoretical and practical reason are fundamentally the same (such as [1785] 1903: 391). However in his case this appears to be the result neither of the derivation of practical from theoretical reason (as in instrumental reasoning) nor of the fusion of theory and practice (as in Platonism) but because his vindication of reason unites practical and theoretical reason (see Neimann 1994; O'Neill 1989 part II, 1992; Velkely 1989).

Kant's vindication of practical reason is controversial, and its adequacy as a guide to action is even more so. Since Hegel criticized Kant, many commentators have concluded that this stripped-down conception of practical reason is simply not enough to guide action, or alternatively that it will guide it in the 'wrong' direction. Some object that virtually any principle can be universally adopted and that this account of practical reason is not robust enough to

guide action; others object (with little plausibility) that the universality requirement makes rigidly uniform demands and leaves no room for the differentiation of action which human life requires.These classic (and incompatible) objections are respectively said to target empty ‘formalism’ and insensitive ‘rigourism’ (see Herman 1993; Hill 1992; O’Neill 1989 part II).

Kantian conceptions of practical reason have recently been taken up in two bodies of literature. Some writers have returned to Kant to look for more plausible interpretations of the procedures by which his conception of practical reason can guide action (see Herman 1993; Hill 1992; Korsgaard 1996; O’Neill 1989 part II) and to explicate his distinctive vindication of practical reason (see Neimann 1994; O’Neill 1989 part I, 1992; Velkely 1989). Others have offered a range of contemporary interpretations of the idea that the fundamental feature of practical reason is its capacity to be public (see Habermas 1995; Rawls 1993; McCarthy 1994).

6 Other aspects of practical reason

Few, if any, accounts of practical reason claim to offer a total guide for action (the exception may be certain utilitarian versions of subjective end-oriented reasoning, which supposedly reduce everything to calculation). Most insist that good practical reasoning must be linked with careful empirical reasoning, and that it will also need judgment to determine the specific way in which an end should be pursued or a norm or principle instantiated (see Moral Judgment). There is general acceptance of the point (emphasized by both Kant and Wittgenstein) that rules cannot provide instructions for their own application, and must be supplemented by judgment. Real life appeals to instrumental reasoning, to socially specific norms and to abstract principles are all inevitably indeterminate and must be augmented with judgment.

Reasoning practically is always a task rather than an automatic process, and there are therefore many ways in which it can fail. Some are cognitive failures (due, for example, to mistaken views about causal links or risks); others are closely linked to questions about motivation. Some central types of failure in practical reasoning have been the subject of extensive study (see Akrasia; Self-deception; Self-control).

Pragmatics

Analytic philosophers have made lasting contributions to the scientific study of language. Semantics (the study of meaning) and pragmatics (the study of language in use) are two important areas of linguistic research which owe their shape to the groundwork done by philosophers.

Although the two disciplines are now conceived of as complementary, the philosophical movements out of which they grew were very much in competition. In the middle of the twentieth century, there were two opposing 'camps' within the analytic philosophy of language. The first - 'ideal language philosophy', as it was then called - was that of the pioneers, Frege, Russell and the logical positivists. They were, first and foremost, logicians studying formal languages and, through these formal languages, 'language' in general. Work in this tradition (especially that of Frege, Russell, Carnap, Tarski and later Montague) gave rise to contemporary formal semantics*, a very active discipline developed jointly by logicians, philosophers and grammarians. The other camp was that of so-called 'ordinary language philosophers', who thought important features of natural language were not revealed, but hidden, by the logical approach initiated by Frege and Russell. They advocated a more descriptive approach, and emphasized the 'pragmatic' nature of natural language as opposed to, for example, the 'language' of Principia Mathematica. Their own work (especially that of Austin, Strawson, Grice and the later Wittgenstein) gave rise to contemporary pragmatics, a discipline which (like formal semantics) has developed successfully within linguistics in the past thirty years.*

From the general conception put forward by ordinary language philosophers, four areas or topics of research emerged, which jointly constitute the core of pragmatics: speech acts; indexicality and context-sensitivity; non-truth-conditional aspects of meaning; and contextual implications. In the first half of this entry, we look at these topics from the point of view of ordinary language philosophy; the second half presents the contemporary picture. From the first point of view, pragmatics is seen as an alternative *to the truth-conditional approach to meaning associated with ideal language philosophy (and successfully pursued within formal semantics). From the second point of view, pragmatics merely* supplements *that approach.*

1 Pragmatics and ordinary language philosophy

The linguistic investigations undertaken by ordinary language philosophers in what was to become 'pragmatics' had been notably anticipated by various researchers belonging to other traditions (phenomenologists like Marty or Reinach, linguists like Bally or Gardiner, psychologists like Bühler, or anthropologists like Malinowski). However, what influenced ordinary language philosophers most was the conception of language advocated by 'ideal language philosophers', against which they reacted strongly (see Ordinary language philosophy).

Central in the ideal language tradition had been the equation of, or at least the close connection between, the meaning of a sentence and its truth-conditions. This truth-conditional approach to meaning, perpetuated by contemporary formal semantics, is one of the things which ordinary language philosophers found quite unpalatable (see Meaning and truth). Their own emphasis was on the distinction between 'language' and 'speech' (Gardiner 1932) or, equivalently, between 'sentence' and 'statement' (Austin [1950] 1971; Strawson [1950] 1971). It is the sentence (a unit of 'language') which has meaning, according to ordinary language philosophers; whereas it is the statement made by uttering the sentence in a particular context which has truth-conditions. The sentence itself does not have truth-conditions. Truth can only be predicated of sentences indirectly, via the connections between the sentence and the 'speech act' it can be used to perform. Rather than equating the meaning of a sentence with its alleged truth-conditions, some philosophers in the pragmatic tradition have suggested equating it with its speech act 'potential' (which may include, as a proper part, a certain truth-conditional potential; see Alston 1964: 37-9).

Suppose that we posit abstract objects, namely 'propositions', which have their truth-conditions essentially. Then the point made by ordinary language philosophers can be put as follows: sentences do not express propositions *in vacuo*, but only in the context of a speech act. Given that the same sentence can be used to make different speech acts with different contents, the 'proposition' which is the content of the speech act must be distinguished from the linguistic meaning of the sentence *qua* unit of the language ('sentence meaning') (see Propositions, sentences and statements). It must also be distinguished from the contextually determined meaning of a particular utterance of the sentence ('utterance meaning'), for the latter includes much more than merely the propositional content of the

speech act performed in uttering the sentence. Utterance meaning includes a rich 'non-truth-conditional' component: Besides the proposition it expresses, an utterance conveys indications concerning the type of speech act being performed, the attitudes of the speaker, the place of the utterance within the discourse, its presuppositions and so forth. Moreover there is a secondary layer of meaning which includes the 'contextual implications' of the speech act, and in particular what H.P. Grice called the 'conversational implicatures' of the utterance.

2 Speech acts

Speech act theory (see Austin 1975; Searle 1969) is concerned with communication: not communication in the narrow sense of transmission of information, but communication in a broader sense which includes the issuing of orders, the asking of questions, the making of apologies and promises, and so on. According to the theory, a speech act is more than merely the uttering of a grammatical sentence endowed with sense and reference. To speak is also to *do* something in a fairly strong sense: it is to perform what J.L. Austin called an 'illocutionary act'. In performing an illocutionary act, a speaker takes on a certain role and assigns a corresponding role to the hearer. By giving an order, speakers express the desire that their hearer follow a certain course of conduct and present themselves as having the requisite authority to oblige the hearer to follow the course of conduct in question, simply because it is their will. The social role taken on by the speaker who gives an order is embodied in the organizational notion of 'superior rank'. Austin stressed such institutional embodiments of illocutionary roles in order to show that language itself is a vast institution incorporating an array of conventional roles corresponding to the range of socially recognized illocutionary acts. From this point of view, assertion - the act of making a statement - is only one illocutionary act among many others.

Illocutionary acts have 'felicity conditions' (conditions which must be contextually satisfied for the illocutionary act to be successfully performed). Thus an assertion about an object 'presupposes' the existence of that object and is felicitous only if the object in question actually exists (Strawson [1950] 1971; Austin 1975). The study of felicity conditions is a central concern of speech act theory, along with the taxonomy of illocutionary acts. But the most central concern, perhaps, relates to the characterization of the very notion of an illocutionary act. Illocutionary acts are generally introduced ostensively, by examples, and they are distinguished both from the mere act of saying something ('locutionary act') and from the act of causing something to happen by saying something ('perlocutionary act', for example frightening, convincing and so on). The nature of the intermediate category of 'illocutionary acts' remains a matter of debate, however. The pioneers of speech act theory, Austin and Searle, advocated an institutional or conventional approach. In this framework the illocutionary acts performed in speech, like the acts that are performed in games (for example, 'winning a set' in tennis), are governed by rules and exist only against a background of conventions. But an alternative, 'intentionalist' view, originating from Grice [1957] 1989 and Strawson [1964] 1971, developed and is now the dominant trend in speech act theory (see §13) (see Speech acts).

3 Contextual implications

The notion of a contextual implication itself is a speech-act theoretic notion. If, besides the meaning or content of an utterance, there is another realm (namely that of the illocutionary act the utterance serves to perform), then along with the implications of what is said there will be a further set of implications derivable from the utterance (namely the implications of the illocutionary act itself). Some of these 'pragmatic' implications are fairly trivial. Thus, according to ordinary language philosophers, it is a rule of the language game of assertion that whoever asserts something believes what they say and has some evidence for it; even the liar, who does not obey this rule, has to pretend that they do if they want to participate in the game. This rule generates pragmatic implications: by asserting something and therefore engaging in the language game, the speaker 'implies' that they obey the rules of the game and, therefore, that they believe whatever they are asserting. The speaker cannot disavow these implications of their speech act without 'pragmatic contradiction'. A pragmatic contradiction is a conflict between what an utterance says and what it pragmatically implies. Thus Moore's famous paradoxical utterance, 'It is raining but I do not believe it', is not self-contradictory in the logical sense: the state of affairs it describes is logically possible (it might be raining without the speaker's knowing it). But the speaker's asserting that it rains implies that they believe it, and this contradicts the second part of the utterance. (The twin notions of pragmatic implication and pragmatic contradiction or 'pragmatic paradox' have been used to illuminate a variety of philosophical issues, including the nature of Descartes' *Cogito*.)

Less trivial are the contextual implications famously discussed by H.P. Grice (1989). According to Grice, the speaker making an utterance does not merely imply that they respect the rules of the language game; among the pragmatic implications of the utterance, we find a number of additional assumptions contextually required in order to maintain the supposition that the rules of the game are being observed. Suppose that I am asked whether I will go out; I reply: ‘It is raining’. As stated above, it is a rule of assertion that the assertor believes what they say and have some evidence for it. By virtue of this rule, my utterance implies that I believe that it is raining, and that I have some evidence for my assertion. Considered as an answer to a question, my utterance also implies that it provides the information requested by the addressee, for it is a rule of the Question-and-Answer game that the answerer must provide the requested piece of information. Now in order to maintain the supposition that the speaker’s utterance actually provides the requested information, additional premises are needed: for example, the assumption that the speaker will not go out if it rains. In conjunction with this contextual assumption, the utterance implies that the speaker will not go out, thereby providing a negative answer to the question. In so far as they serve to restore the utterance’s conformity to the rules of the game, the conclusion that the speaker will not go out and the contextual assumption through which it is derived are further pragmatic implications of the utterance. Grice called them ‘conversational implicatures’. Contrary to the more trivial pragmatic implications, they can be disavowed by the speaker without pragmatic contradiction (at least if there is another way of making the utterance compatible with the supposition that the rules of the game are being respected). This distinguishing feature of conversational implicatures is referred to as their ‘cancellability’. Implicatures which are not disavowed are legitimately taken as part of what the utterance communicates. They constitute a second layer of meaning, additional to what is literally said (see §12) (see Implicature).

4 Non-truth-conditional aspects of meaning

Like pragmatic implications, non-truth-conditional aspects of meaning are easy to account for if speech is considered as a rule-governed activity (Stenius 1967). What is the meaning of, for example, the imperative mood? Arguably, the sentences ‘You will go to the shop tomorrow at 8’, ‘Will you go to the shop tomorrow at 8?’ and ‘Go to the shop tomorrow at 8’ describe the same (sort of) state of affairs. The difference between them is pragmatic rather than descriptive: it relates to the type of illocutionary act being performed by the utterance. Thus the imperative mood indicates that the speaker, in uttering the sentence, performs an illocutionary act of a ‘directive’ type. (Such an act is governed by the rule that if the speaker performs a directive act with content *P*, the addressee is to make it the case that *P*.) To account for this ‘indication’, which does not belong to the utterance’s descriptive or propositional content, we can posit a rule or convention to the effect that the imperative mood is to be used only if one is performing a directive type of illocutionary act. This rule gives ‘conditions of use’ for the imperative mood. By virtue of this rule, a particular token of the imperative mood in an utterance u ‘indicates’ that a directive type of speech act is being performed by u. This (token-reflexive) indication conveyed by the token follows from the conditions of use that govern the type; these conditions of use constitute the linguistic meaning of the type (Recanati 1987: 15-7).

Pragmatic indications are a species of pragmatic implication: they are what the use of a particular expression pragmatically implies, by virtue of a certain condition of use conventionally associated with the expression. In contrast to more standard pragmatic implications, however, pragmatic indications are linguistically encoded, via the condition of use conventionally associated with the expression. Grice (1989) called such conventional pragmatic implications ‘conventional implicatures’, as opposed to ‘conversational implicatures’ (see Implicature §4). Whether they concern the type of the illocutionary act, as in the example I have given, or some other aspect of the context of utterance, pragmatic indications can always be accounted for in terms of conditions of use. They are ‘use-conditional’ aspects of meaning. Their exploration is one of the empirical tasks of semantics construed as the study of linguistic meaning under all its aspects (see §8 for an alternative construal of ‘semantics’).

5 Indexicals

Use-conditional meaning is not incompatible with descriptive content, in the sense that one and the same expression can be endowed with both. There are expressions which have a purely use-conditional meaning and do not contribute to truth-conditional content. Illocutionary markers like the imperative mood, or discourse particles such as ‘well’, ‘still’, ‘after all’, ‘anyway’, ‘therefore’, ‘alas’, ‘oh’ and so forth, fall into this category. Thus the following utterances have the same truth-conditional content, and are distinguished only by the pragmatic

indications they respectively convey:

Well, Peter did not show up
Still, Peter did not show up
After all, Peter did not show up
Therefore, Peter did not show up
Alas, Peter did not show up

But there are also expressions which have a two-layered meaning. Indexicals are a case in point. A 'rule of use' is clearly associated with indexicals: thus 'I' is governed by a convention of use (it is to be used to refer to the speaker). By virtue of this conventional rule, a use u of 'I' token-reflexively indicates that it refers to the speaker of u. But u also contributes to the utterance's truth-conditional content. 'I' being a directly referential expression, its truth-conditional contribution (its 'content') is its actual referent, not the rule of use which contextually determines the referent (Kaplan 1989: 481-563; Recanati 1993).

Besides the horizontal distinction between truth-conditional and non-truth-conditional aspects of meaning, we see that there is a vertical distinction between two levels of meaning for indexical expressions (Strawson [1950] 1971; Kaplan 1989: 481-563). At the first level - corresponding to the linguistic meaning of the expression-type - we find the rule of use conventionally associated with the expression. At the second level - corresponding to the context-dependent semantic value of the token - the rule of use determines the expression's 'content' (see Demonstratives and indexicals).

6 Levels of meaning

The two distinctions we have made, between truth-conditional and non-truth-conditional aspects of meaning on the one hand, and between levels of meaning on the other hand, should not be conflated (as they often have been). Despite appearances, they are orthogonal to each other. In the same way as the truth-conditional content of an indexical sentence is context-dependent and, therefore, belongs to the second level of meaning, the pragmatic indications conveyed by an expression governed by a rule of use also are context-dependent and belong to the second level of meaning. In other words, a distinction must be made between the rule of use (first level of meaning) and the pragmatic indications it contextually generates, in the same way as we distinguish between the rule of use and the truth-conditional content it contextually determines.

That pragmatic indications, though conventional, are context-dependent is shown by examples like (1):

(1) The weather is nice, but I have a lot of work.

The conjunction 'but' is governed by a certain condition of use which distinguishes it from 'and'. According to Ducrot (1972: 128-9), 'but' is to be used only if the following conditions are contextually satisfied:

(i) The first conjunct (*P*) supports a certain conclusion *r*;
(ii) The second conjuncts (*Q*) supports *not-r*;
(iii) *Q* is considered stronger than *P*, that is the whole utterance supports *not-r*.

Uttering (1) pragmatically implies that the conditions of use associated with 'but' are satisfied, that is that there is a conclusion *r* such that the first conjunct supports *r* and the second conjunct more strongly supports *not-r*. But the pragmatic implication conveyed by a particular utterance of (1) is much more specific. In context, the variable *r* is assigned a particular interpretation, for example 'we should go for a walk'. Example (1) therefore pragmatically implies something like the following: we should not go for a walk (because of all the work I have to do), despite the nice weather which suggests otherwise.

In so far as it is context-dependent and conveyed by the token, this pragmatic implication is to be located at the second level of meaning, alongside the content of indexicals. Even in a case where the pragmatic indication is fully conventional and not in need of contextual specification, it is conveyed by the token, not by the type. Thus a particular use u of the pronoun 'I' indicates that it (u) refers to the speaker of u. This token-reflexive indication is distinct from the rule of use, to the effect that for all *x*, if *x* is a token of 'I' it must be used to refer to the speaker of *x*.

The picture is further complicated by the Gricean distinction between what is literally said and what is non-literally or indirectly communicated. We end up with a three-fold distinction between the following layers of meaning:

First level. Rules of use ('character', in Kaplan's framework).
Second level. Truth-conditional content + pragmatic indications.
Third level. Conversational implicatures.

The need for a third level of meaning comes from the fact that the contextual process responsible for conversational implicatures (and non-conventional pragmatic implications in general) takes the second-level meaning of the utterance as input. When an expression is governed by a condition of use, using that expression pragmatically implies that the condition is satisfied. But conversational implicatures, in contrast to conventional implicatures, are not generated by virtue of a condition of use directly associated with a particular linguistic expression; they are normally generated by virtue of conversational norms that concern the content of utterances rather than the expressions which are used to convey that content. For example, a speaker should not say what he believes to be false (the 'maxim of quality' in Grice's terminology); as a result, saying that *P* pragmatically implies that the speaker believes that *P*. The generation of this pragmatic implication presupposes that the proposition expressed has been identified: from the fact that *the speaker has said that P*, together with the default assumption that the maxim of quality is respected, we can infer that *the speaker believes that P*. The implicature-generating process therefore deserves to be called a 'secondary pragmatic process' (Recanati 1993). There are three basic levels of meaning, with the context controlling the transition from the first to the second and from the second to the third. The proposition expressed by the utterance must first be contextually identified (primary pragmatic process) in order for the non-conventional pragmatic implications to be derived (secondary pragmatic process).

7 Open texture

For ordinary language philosophers, the truth-conditional or 'descriptive' content of an utterance is a property of the speech act, not a property of the sentence. A sentence only has truth-conditions in the context of a speech act. This is so not merely because of indexicality: the fact that the reference of some words depends on the context in a systematic way. Indexicality is only one form of context-dependence. There is another one, no less important, which affects the sense (the conditions of application) of words rather than their reference. According to Austin and Wittgenstein, words have clear conditions of application only against a background of 'normal circumstances' corresponding to the type of context in which the words were used in the past. There is no 'convention' to guide us as to whether or not a particular expression applies in some extraordinary situation. This is not because the meaning of the word is 'vague', but because the application of words ultimately depends on there being a sufficient similarity between the new situation of use and past situations. The relevant dimensions of similarity are not fixed once and for all; this is what generates 'open texture' (Waismann 1951). Ultimately, it is the context of utterance which determines which dimension of similarity is relevant, hence which conditions have to be satisfied for a given expression to apply (Travis 1975; 1981). It follows that the sense of ordinary descriptive words is context-dependent, like the reference of indexicals, though not quite in the same way. On this approach, which we may call 'contextualism', truth-conditions cannot be ascribed to sentence-types but only to utterances (Searle 1978; 1983).

Contextualism was a central tenet in the pragmatic conception of language developed by ordinary language philosophers (though some atypical ordinary language philosophers, like Grice, rejected it). This conception is, at bottom, a 'use theory of meaning'. Meaning is use, in the following sense: there is nothing more to meaning than use (Wittgenstein 1953). We are confronted with uses of words, and the meaning which those words acquire for us is only the sense we are able to *make* of those uses.

8 The semantics/pragmatics distinction

If much of contemporary pragmatics derives from the work of ordinary language philosophers, the name 'pragmatics' - contrasted with 'syntax' and 'semantics' - was coined by a philosopher in the ideal language tradition, Charles Morris (1938). The general conception associated with Morris' tripartite distinction has been very influential. On this conception (hereafter 'the traditional conception'), semantics and pragmatics are

complementary studies: semantics deals with meaning understood as representational content, whereas pragmatics deals with use. This view, still influential today, is at odds with the more radical conception developed within ordinary language philosophy and sketched in the previous sections. (According to the latter view, meaning cannot be divorced from use; semantics *is* pragmatics.) However, as we shall see, the border between semantics and pragmatics has become much fuzzier as the traditional conception, with its sharp contrast between the two disciplines, was modified in order to account for indexicality, pragmatic indications and related phenomena.

The traditional conception is commonly glossed in two different ways, corresponding to two different distinctions. The first distinction is that between 'meaning' (that is, representational content) and 'force', to be found both in Frege and Austin. (Often the term 'sense' is used instead of 'meaning', and the distinction referred to as the 'sense-force distinction'. Some commentators insist on distinguishing the use of 'sense' as the complement of 'force' from the use of 'sense' as the complement of 'reference'; see Sense and reference.) An utterance (1) represents a certain state of affairs, and (2) serves to perform a certain speech act. The semantics/pragmatics distinction is often expressed in terms of this distinction: semantics deals with representational content and studies the relations between words and the world, while pragmatics studies the relations between words and their users. The second distinction is that between sentence meaning and utterance meaning. Semantics is supposed to deal with the linguistic meaning of sentence-types, while pragmatics is concerned with the total significance of an utterance of the sentence by a particular speaker in a particular context. The traditional conception is indifferently expressed in terms of either distinction because, according to the traditional conception, the conventional meaning of the sentence-type *is* its representational content.

The problem with the traditional conception is precisely that it rests on the equation of the meaning of a sentence with its representational content. This equation cannot be accepted, for two reasons:

(1) Indexical sentences represent a specific state of affairs only in context; their representational content depends on some feature of their context of use, hence it cannot be equated with the context-independent meaning of the sentence-type. Because the truth-conditions of indexical sentences depend on their use, some authors have argued that the study of truth-conditions for such sentences belongs to pragmatics (Bar-Hillel 1954); it has even been suggested that pragmatics *is* the study of truth-conditions for indexical sentences (Montague 1968).
(2) As we have seen, there are use-conditional as well as truth-conditional aspects of the meaning of sentence-types. To account for them, it seems we must give up the purely truth-conditional conception of semantics and make room for a non-truth-conditional component within it. Alternatively, we can say that it is the business of 'pragmatics' to deal with some aspects of the linguistic meaning of sentence-types, namely those aspects which relate to use. Thus Gazdar (1979) defines pragmatics as 'semantics minus truth-conditions'.

Some philosophers have tried to defend the traditional conception by forcing use-conditional aspects of meaning into the mould of truth-conditional semantics. Take, for example, the imperative mood. One can use the pragmatic equivalence between the imperative 'Close the door!' and the 'explicit performative' 'I order you to close the door' (Austin 1975: 32) to support the claim that non-declarative sentences have a declarative paraphrase through which they can be given a truth-conditional analysis (Lewis 1970: 54-61). A number of similar attempts have been made to reduce use-conditional to truth-conditional aspects of meaning (for example, Davidson 1979). Despite these attempts, it is commonly acknowledged that not all aspects of linguistic meaning are truth-conditional. There are two components in the meaning of a sentence: a truth-conditional or descriptive component and a non-truth-conditional, pragmatic component. The pragmatic component of sentence meaning constrains the context of utterance: it is a 'procedural' component. As for the descriptive component of sentence meaning, it can no longer be equated with the truth-conditional content of the utterance (because of objection (1)), but it can still be construed as what *determines* that content with respect to a context of use.

This leaves us with two interpretations of the semantics/pragmatics distinction, both current in the contemporary literature. On one interpretation, dominant among philosophers, pragmatics deals with use - including use-conditional aspects of meaning (pragmatic indications, presuppositions and the like) - while semantics deals both with the descriptive component of sentence meaning and the truth-conditional content it determines (with respect to a context). The other interpretation, widespread among linguists, has it that semantics deals with conventional sentence meaning under all its aspects (including non-truth-conditional aspects), while pragmatics deals with use and the aspects of meaning which are contextual and use-dependent, that is, those that are conveyed

by the utterance but cannot be ascribed to the sentence-type (Katz 1977: 13- 22). (This category of ‘contextual meaning’ is somewhat heterogeneous; it includes both the semantic values of context-sensitive expressions, which are constitutive of the proposition literally expressed by the utterance, and other aspects of meaning which are not ‘literal’, conversational implicatures, for example.)

9 Context and propositional attitudes

The descriptive component of sentence meaning can be equated with a function from contexts to propositions (Stalnaker 1970; Kaplan 1989: 481-563). The ‘context’ is often construed as a package of various situational factors relevant to determining the semantic values of the context-sensitive constituents of the sentence. (See §10 for an alternative construal.) Thus the place of utterance, the identity of the participants in the speech episode and the time of utterance are among the factors on which the proposition expressed by an indexical sentence depends. It would be a mistake, however, to hold that only such ‘external’ (that is, non-intentional) features of the situation of utterance have a role to play in the determination of what is said. In many cases, what the speaker ‘has in mind’ is the relevant factor. Thus ‘John’s book’ can mean the book which John wrote, the book he bought, the book he is reading, and so forth. The sentence in which the expression occurs expresses a definite proposition only when a particular relation between John and a certain book has been contextually determined, but there is no ‘rule’ which enables the interpreter to determine the latter except that it must be the relation which the speaker ‘has in mind’. (This is in contrast with the case of ‘I’: as Barwise and Perry (1983: 33) pointed out, the reference of ‘I’ is fixed by the rule that ‘I’ refers to the speaker, irrespective of the speaker’s beliefs and intentions. Even if a speaker believes that they are Napoleon, their use of ‘I’ does not refer to Napoleon.) The same thing holds for demonstratives in general: contrary to the received opinion, the reference of a demonstrative is not the ‘demonstrated’ object, for there may be no accompanying demonstration; the reference, rather, is the object which the speaker has in mind and wishes to single out (Kaplan 1989: 565-614; Bach 1987).

It turns out that the context against which an utterance is interpreted includes factors like the intentions, expectations, beliefs and other propositional attitudes of the speaker and their audience. Especially important are the beliefs which are shared and ‘mutually known’ to be shared; they constitute a ‘common ground’ which can be exploited in discourse (see Stalnaker’s 1974 paper ‘Pragmatic Presuppositions’ in Davis 1991; Clark 1992). This introduces the topic of ‘presupposition’ which is generally mentioned, along with speech acts, indexicals and implicatures, as one of the central issues in pragmatics.

10 Presupposition

There is a basic sense in which ‘presupposing’ is a pragmatic attitude towards a proposition: that of ‘taking it for granted’. (One takes something for granted, for example, when one uses it as a hidden premise in an argument.) The ‘context’ is sometimes defined as a set of presuppositions in this sense, that is a set of propositions which are taken for granted at a given point in discourse (see Karttunen 1974, for example). Many authors think that in order to be part of the context, a proposition must be not only believed by the participants in the speech episode, but also believed to be believed, and so forth. Other authors find this ‘mutual belief’ requirement too strong (Smith 1982). Be that as it may, a more pressing question arises in connection with presuppositions. Beside the pragmatic notion of presupposition (where presupposing is something a *speech participant* does), is there also a purely semantic notion, where presupposing is something which a *sentence* does? For example, does the sentence ‘John stopped teaching undergraduates’ carry the presupposition that John used to teach undergraduates as part of its semantic, truth-conditional content?

The semantic notion of presupposition has been questioned on two grounds. First, it has been pointed out that presuppositions, like conversational implicatures, seem to be defeasible or cancellable. This might suggest that the basic, pragmatic sense is the only sense we can give to the notion of presupposition. *Sentences* do not have presuppositions; only the participants in a speech episode can presuppose something. This conclusion, however, seems too strong, for the conventional nature of presuppositions is manifest and well-documented. Arguably, what the defeasibility of presuppositions shows is not that presuppositions are non-conventional, but rather that they can be overridden if certain conditions are satisfied (Gazdar 1979).

More convincing is the claim that presuppositions, though part of the conventional meaning of the sentence, do not affect the truth-conditions of the utterance. Like pragmatic indications in general, the linguistic presuppositions

associated with certain expressions (such as the verb 'stop' in the example above) can be construed as conditions of use or constraints on the context (see Stalnaker's 1974 paper 'Pragmatic Presuppositions' in Davis 1991). The linguistic presupposition encoded by the verb 'stop' is a certain constraint on the context, namely the requirement that it contain a speaker with a certain pragmatic attitude (the attitude of 'presupposing') towards a certain proposition, or (if the context is directly construed as a set of propositions) the requirement that it contain a certain proposition, namely the proposition that John used to teach undergraduates. An utterance of 'John stopped teaching undergraduates' is 'appropriate' only in a context in which this constraint is satisfied. The constraint in question belongs to the non-truth-conditional component of sentence meaning: it does not affect the (truth-conditional) 'content' of the utterance (see Presupposition).

11 Interpretation and context-change

The rich, propositional notion of 'context' which features in discussions of presupposition is at the heart of contemporary pragmatics. As we have seen in connection with demonstratives and semantically indeterminate expressions, the context provides 'assumptions' concerning the speaker's intentions and expectations, which are used to determine the proposition expressed by the sentence. This process of determination is construed as fundamentally inferential and proposition-involving. (See §14 on the intentional-inferential approach.)

The propositional notion of context makes it possible to see the relation between context and content as two-way rather than one-way (Kamp 1985: 240). The proposition expressed, which depends on the context, itself changes the context. According to dynamic theories of discourse, the content of an assertion is normally fed into the context against which the next utterance will be interpreted (Karttunen 1974; Stalnaker 1978; Kamp 1985; Heim's 1988 paper 'On the Projection Problem for Presuppositions' in Davis 1991). The context of interpretation constantly changes - Stalnaker speaks of an 'everchanging context' - because it evolves as discourse proceeds. Thus it is possible for the context to shift in the middle of an utterance. This possibility accounts for a number of puzzling facts, including the defeasibility of presuppositions (see Discourse semantics).

If the proposition expressed by an utterance is normally fed into the context, the assumption that this proposition has been expressed *always* becomes part of the context as a result of the interpretation of the utterance. It is this assumption, together with the default assumption that the speaker respects the norms of conversation (plus various other assumptions included in the context), which make it possible to infer the conversational implicatures which enrich the overall meaning of the utterance. It follows that the contextual changes induced by an utterance by virtue of its expressing a certain proposition affect not only the interpretation of the utterances that follow, but equally the overall meaning of the very utterance responsible for the contextual change.

Another sort of context-change induced by an utterance has been described by David Lewis (1979). Sometimes the default assumption that the speaker respects the norms of conversation prevents the utterance from being interpreted with respect to the context at hand because, if it were so interpreted, it would violate the norms in question. This leads to a modification of the context in order to reach a more satisfactory interpretation. Thus if the utterance presupposes that *P*, and *P* is not part of the context at hand, it is introduced into the context in order to bring the utterance into conformity with the norms ('accommodation').

12 The strategic importance of conversational implicatures

If semantics and pragmatics both study the contextual determination of the proposition expressed (in so far as it depends both on the linguistic meaning of the sentence and the context), conversational implicatures fall within the sole domain of pragmatics, for they are not constrained by the linguistic meaning of the sentence in the way the proposition expressed is. Yet the theory of implicatures has important consequences for semantics. Thanks to Grice's theory, many intuitive aspects of meaning can be put into the 'pragmatic wastebasket' as implicatures, rather than treated as genuine data for semantics. Take, for example, the sentence '*P* or *Q*'. It can receive an inclusive or an exclusive interpretation. Instead of saying that 'or' is ambiguous in English, we may consider it as unambiguously inclusive, and account for the exclusive reading by saying that in some contexts the utterance conversationally implicates that *P* and *Q* are not both true. When there is such a conversational implicature, the overall meaning of the utterance is clearly exclusive, even though what is strictly and literally said corresponds to the logical formula '$P \vee Q$'. It is here that the complementary character of semantics and pragmatics is particularly manifest. Semantics is simplified because a lot of data can be explained away as 'implicatures' rather

than genuine aspects of the (literal) meaning of the utterance.

Grice's theory of implicatures has been extremely popular among semanticists precisely because it enables the theorist, when certain conditions are satisfied, to shift the burden of explanation from semantics to pragmatics. From this point of view, the most interesting notion is that of 'generalized' conversational implicatures (Grice 1989; Gazdar 1979; Levinson 1983). When a conversational implicature is generalized, that is generated by default, it tends to become intuitively indistinguishable from semantic content. Grice's theory has taught the semanticist not to take such 'semantic' intuitions at face value. Even if something seems to be part of the semantic content of an utterance, the possibility of accounting for it pragmatically must always be considered.

Grice's theory is important also because it has provided an influential argument against the contextualism professed by ordinary language philosophers. For example, Strawson had claimed that the truth-conditions of '*P* and *Q*' in English are contextually variable: the notion of temporal succession, or that of causal connection, or a number of other suggestions concerning the connection between the first and the second conjunct can enter into the interpretation of '*P* and *Q*', depending on the context (Strawson 1952: 81-2). 'They got married and had many children' means that they had children after getting married; 'Socrates drank the hemlock and died' means that he died as result of drinking the hemlock. Those aspects of the interpretation are very much context-sensitive; yet they affect the utterance's truth-conditions. The truth-conditions of '*P* and *Q*', therefore, are not fixed by a rigid rule, but depend on the context. Against this view, Grice has argued that the truth-conditions of '*P* and *Q*' *are* fixed and context independent. '*P* and *Q*' is true if and only if *P* and *Q* are both true. Thus 'They got married and had many children' would be true, even if they had the children before getting married. Certainly the utterance conveys the suggestion that the children came after the marriage, but this suggestion is nothing other than a conversational implicature, according to Grice (see Implicature §6). It does not affect the utterance's semantic content - its literal truth-conditions. Grice criticized his fellow ordinary language philosophers for confusing the truth-conditions of an utterance with its total significance. Though controversial (Travis 1985), this argument has been very popular, and it has played a major role in the subsequent downfall of ordinary language philosophy.

13 Communicative intentions

The pioneers of pragmatics (Malinowski and Austin, for example) used to insist on the social dimension of language as opposed to its cognitive or representational function. As pragmatics developed, however, it is the psychological dimension of language use that came to the forefront of discussions, in part as a result of Grice's work on meaning and communication.

Grice ([1957] 1989) defined a pragmatic notion of meaning: the notion of *someone* meaning something by a piece of behaviour (a gesture, an utterance and so forth). Grice's idea was that this pragmatic notion of meaning was basic and could be used to analyse the semantic notion, that is what it is for a linguistic *expression* to have meaning (see Grice, H.P. §3). Strawson soon pointed out that Grice's pragmatic notion of meaning could also be used to characterize the elusive notion of an illocutionary act (Strawson [1964] 1971). In §2, the view that illocutionary acts are essentially conventional acts (like the acts which owe their existence to the rules of a particular game) was mentioned. This conventionalist approach was dominant in speech act theory until Strawson established a bridge between Grice's theory of meaning and Austin's theory of illocutionary acts. Illocutionary acts, in the new framework, can be analysed in terms of the utterly non-mysterious notion of a 'perlocutionary act'.

A perlocutionary act consists in bringing about certain effects by an utterance. For example, by saying to you 'It is raining', I bring it about that you believe that it is raining. Now, according to the suggested analysis, to perform the illocutionary act of asserting that it is raining is (in part) to make manifest to the addressee one's intention to bring it about, by this utterance, that the addressee believes that it is raining. An illocutionary act therefore involves the manifestation of a corresponding perlocutionary intention. But there is a special twist which the suggested analysis inherits from Grice's original conception of meaning: the intention must be made manifest in a specially 'overt' manner. Not only must the speaker's intention to bring about a certain belief in the addressee be revealed by his utterance, but his intention to reveal it must also be revealed, and it must be revealed in the same overt manner. This characteristic (if puzzling) feature of overtness is often captured by considering the revealed intention itself as reflexive: a communicative intention, that is the type of intention whose manifestation constitutes the performance of an illocutionary act, is the intention to achieve a certain perlocutionary effect (for example, bringing about a certain belief in the addressee) via the addressee's recognition of this intention. Also

relevant to the characterization of overtness is the notion of ‘mutual knowledge’ (Lewis 1969; Schiffer 1972) which we have seen at work in the characterization of ‘contexts’ and ‘presuppositions’ (see §10) (see Communication and intention; Meaning and communication).

14 The intentional-inferential model

Even though the conventionalist approach to communication is still alive, the Grice-Strawson ‘intentionalist’ approach has gained wide currency in pragmatics. Typical in this respect are the neo-Gricean theories offered by Bach and Harnish (1979) and Sperber and Wilson (1986). They have put forward an inferential model of communication intended to supersede the ‘code model’ (or ‘message model’) that was inspired from Shannon and Weaver.

According to the code model, communication proceeds as follows: to communicate a certain content, the speaker encodes it into a sentence using the grammar of the language as a ‘code’ pairing contents and sentences (possibly with respect to a context of utterance); the interpreter, by virtue of their knowledge of the same grammar (and, perhaps, of the context), can decode the sentence and recover the intended content.

The alternative, inferential model of communication is very different. An utterance is seen as a meaningful action, one which provides interpreters with evidence concerning the agent’s intentions. What distinguishes communicative acts from other meaningful actions is what can be inferred from the evidence: a communicative act is an act which provides evidence of a certain ‘communicative intention’ on the part of the speaker. In other words, the speaker’s intention to communicate something is what explains their utterance, when considered as a piece of behaviour. From this point of view, the content of the communicative act - what is communicated - is the total content of the communicative intentions which can be inferred from it. Let us call this the utterance’s communicative meaning, distinct from the literal or conventional meaning of the sentence (determined by the code, that is the grammar). Understanding is essentially an inferential process in this framework, and the conventional meaning of the sentence provides only part of the evidence used in determining the communicative meaning of the utterance.

15 Pragmatics and modularity

A characteristic feature of recent work in the Gricean tradition has been the explicit employment of concepts from (and the intention to contribute to) cognitive science. For example, Fodor’s distinction between central thought processes and more specialized cognitive ‘modules’ has been found relevant to the characterization of the task of pragmatics (see Modularity). (See, for example, Kasher’s papers in Davis 1991 and Tsohatzidis 1995.)

In the inferential framework, comprehension involves not only a specifically linguistic competence, namely knowledge of ‘grammar’, but also general intelligence (that is, world knowledge together with inferential abilities). Contextual assumptions of various sorts, including assumptions about the speaker’s beliefs and expectations, play a crucial role not only in the inferential process which, according to Grice and his followers, underlies the generation of conversational implicatures, but also in the determination of the proposition literally expressed by the utterance (Carston 1988; Kempson 1988). Pragmatics, therefore, is concerned with the interaction between the language faculty and central thought processes in the task of linguistic comprehension (Sperber and Wilson 1986). It considers how the output of the linguistic module is centrally processed, that is processed against the interpreter’s complete belief system.

The major difficulty here is the ‘holistic’ character of the belief system (Fodor 1983). How is the total cognitive background restricted so as to yield a ‘context’ of manageable size? Sperber and Wilson’s ‘relevance theory’ addresses this crucial issue. Their view of pragmatics is grounded in a general theory of cognition as relevance-oriented. One of their central ideas is that the context in which an utterance is processed is not ‘given’ but ‘constructed’: it results from an active search driven by the overarching goal to maximize relevance.

Sperber and Wilson’s claim that there is no special faculty or module corresponding to pragmatics (since pragmatics studies the interaction between general intelligence and linguistic modules) must be qualified. As Sperber himself stressed in various places (for example, Sperber 1994), there is one special capacity which communicators must possess and which, arguably, poor communicators (for example, autistic children) do not possess: the capacity to ascribe complex propositional attitudes, such as higher-order intentions. (As we have seen,

understanding crucially involves a process of intention recognition, and the communicative intentions which must be recognized are complex, higher-order intentions.)

16 Cognitive science and contextualism

The intentional-inferential framework has been very influential in cognitive science. The Grice-Strawson interpretation of speech act theory has given rise to computational models of discourse where intention recognition plays a key role (see Grosz, Pollack and Sidner 1989; Cohen, Morgan and Pollack 1989). The idea that meaning is 'inferred' has also been taken very seriously. Many cognitive scientists believe that in interpretation the meaning of an utterance is arrived at by 'guesswork', rather than by decoding (Green 1989).

Typical in this respect are complex nominals (noun-noun compounds like 'finger cup' or adjective-noun compounds like 'philosophical kitchen'), which have received a good deal of attention. The semantic value which such expressions assume in context (unless they are idiomatic) is not predictable on a purely linguistic basis; it results from an act of 'sense creation'. Here again, what matters is what the speaker has in mind; the interpreter can only guess, using a variety of contextual clues. Such expressions whose sense is irreducibly contextual have been dubbed 'contextual expressions' (Clark 1992).

Contextual expressions are 'semantically indeterminate'. The extent of indeterminacy in language threatens the standard picture adhered to by most semanticists. According to that picture, 'what is said' is conventionally determined by the meaning of the sentence and the context. Then, and then only, is what the speaker really means 'inferred', if there is reason to think that what the speaker means is distinct from what is said (for example, if the speaker's literal contribution seems conversationally inappropriate and some further assumption is required in order to restore its conformity to conversational norms). As against this, both what is said and what is implied are seen as resulting from guesswork, because of semantic indeterminacy.

The fallback position for semanticists consists in holding that at least the meaning of the sentence-type is 'decoded' and can be read off the meanings of the constituents (as given in the lexicon) and the way they are put together. Decoding stops, and guesswork starts, only when we go from the meaning of the sentence to what the speaker means (this including both what is said and what is conversationally implied). But the fallback position itself has come under attack in the cognitive science literature. The very notion of the linguistic meaning of an expression-type has been questioned.

What is the linguistic meaning of a word? Is it possible to draw a line between 'pure' lexical knowledge and world knowledge? Arguably it is not (Langacker 1987: 154-66). For Langacker, the meaning of a word is a point of access into an essentially encyclopedic network. There is no distinction between 'dictionary' and 'encyclopedia'. A similar idea underlies Rumelhart's claim that interpretation is 'top down' from the bottom up (Rumelhart 1979). According to Rumelhart, what linguistic expressions do is evoke certain 'schemata' in memory. Those memorized schemata are part of our knowledge of the world. Interpretation, whether literal or non-literal, consists in finding evoked schemata which fit the situation the speaker seems to be talking about.

Langacker and Rumelhart reject not only the dictionary/encyclopedia distinction but also the literal/non-literal distinction as traditionally conceived. They insist that the same cognitive processes are involved in literal and (for example) metaphorical interpretations (see Gibbs 1994; Recanati 1995). A psychologist, Douglas Hintzman, has gone even farther, questioning the most basic distinction: that between the meaning of an expression-type and the contextual meaning of the token. Hintzman has developed a multiple-trace memory model in which the cognitive experiences associated with past tokens of a word interact with the present experience involving a new token of the word to yield the contextual 'meaning' of the latter (Hintzman 1986). Hintzman's model does not appeal to the notion of the literal meaning of the word-type. Words, as expression-types, do not have 'meanings' over and above the collection of token-experiences with which they are associated. The only meaning that words have is that which emerges in context.

Rejecting the three distinctions above - literal/non-literal, dictionary/encyclopedia and type-meaning/token-meaning - amounts to rejecting the semantics/pragmatics distinction. The 'eliminativist' approach to linguistic meaning developed within cognitive science constitutes a return to contextualism, the radical conception of pragmatics associated with ordinary language philosophy (§7). Pragmatics absorbs semantics in a contextualist framework.

Pragmatism

Pragmatism is a philosophical tradition founded by three American philosophers: Charles Sanders Peirce, William James and John Dewey. Starting from Alexander Bain's definition of belief as a rule or habit of action, Peirce argued that the function of inquiry is not to represent reality, but rather to enable us to act more effectively. He was critical of the 'copy theory' of knowledge which had dominated philosophy since the time of Descartes, and especially of the idea of immediate, intuitive self-knowledge. He was also a prophet of the linguistic turn, one of the first philosophers to say that the ability to use signs is essential to thought.

Peirce's use of Bain was extended by James, whose The Principles of Psychology (1890) broke with the associationism of Locke and Hume. James went on, in Pragmatism (1907) to scandalize philosophers by saying that '"The true"… is only the expedient in our way of thinking'. James and Dewey both wanted to reconcile philosophy with Darwin by making human beings' pursuit of the true and the good continuous with the activities of the lower animals - cultural evolution with biological evolution. Dewey criticized the Cartesian notion of the self as a substance which existed prior to language and acculturation, and substituted an account of the self as a product of social practices (an account developed further by George Herbert Mead).

Dewey, whose primary interests were in cultural, educational and political reform rather than in specifically philosophical problems (problems which he thought usually needed to be dissolved rather than solved), developed the implications of pragmatism for ethics and social philosophy. His ideas were central to American intellectual life throughout the first half of the twentieth century.

All three of the founding pragmatists combined a naturalistic, Darwinian view of human beings with a deep distrust of the problems which philosophy had inherited from Descartes, Hume and Kant. They hoped to save philosophy from metaphysical idealism, but also to save moral and religious ideals from empiricist or positivist scepticism. Their naturalism has been combined with an anti-foundationalist, holist account of meaning by Willard van Orman Quine, Hilary Putnam and Donald Davidson - philosophers of language who are often seen as belonging to the pragmatist tradition. That tradition also has affinities with the work of Thomas Kuhn and the later work of Ludwig Wittgenstein.

1 Classical pragmatism

Charles Sanders Peirce, William James and John Dewey - often referred to as the three 'classical pragmatists' - had very different philosophical concerns. Except for their shared opposition to the correspondence theory of truth, and to 'copy theories' of knowledge, their doctrines do not overlap extensively (see Truth, pragmatic theory of). Although each knew and respected the other two, they did not think of themselves as belonging to an organized, disciplined philosophical movement. Peirce thought of himself as a disciple of Kant, improving on Kant's doctrine of categories and his conception of logic. A practising mathematician and laboratory scientist, he was more interested in these areas of culture than were James or Dewey. James took neither Kant nor Hegel very seriously, but was far more interested in religion than either Peirce or Dewey. Dewey, deeply influenced by Hegel, was fiercely anti-Kantian. Education and politics, rather than science or religion, were at the centre of his thought.

Peirce was a brilliant, cryptic and prolific polymath, whose writings are very difficult to piece together into a coherent system. He is now best known as a pioneer in the theory of signs, and for work in logic and semantics contemporaneous with, and partially paralleling, that of Frege. Peirce's account of inquiry as a matter of practical problem-solving was complemented by his criticisms of the Cartesian (and empiricist) idea of 'immediate knowledge', and of the project of building knowledge on self-evident foundations (of either a rationalist or empiricist kind).

Peirce protested against James' appropriation of his ideas, for complex reasons to do with his obscure and idiosyncratic doctrine of 'Scotistic realism' - the reality of universals, considered as potentialities or dispositions. Peirce was more sympathetic to metaphysical idealism than James, and found James' version of pragmatism simplistic and reductionist. James himself, however, thought of pragmatism as a way of avoiding reductionism of all kinds, and as a counsel of tolerance. Particularly in his famous essay 'The Will to Believe' (1896), he attempted to reconcile science and religion by viewing both as instruments useful for distinct, non-conflicting purposes.

Although he viewed many metaphysical and theological disputes as, at best, exhibitions of the diversity of human temperament, James hoped to construct an alternative to the anti-religious, science-worshipping positivism of his day. He approvingly cited Giovanni Papini's description of pragmatism as 'like a corridor in a hotel. Innumerable chambers open out of it. In one you may find a man writing an atheistic volume; in the next someone on his knees praying for faith; in a third a chemist investigating a body's properties … they all own the corridor, and all must pass through it'. His point was that attention to the implications of beliefs for practice offered the only way to communicate across divisions between temperaments, academic disciplines and philosophical schools.

Dewey, in his early period, tried to bring Hegel together with evangelical Christianity. Although references to Christianity almost disappear from his writings around 1900, in a 1903 essay on Emerson he still looked forward to the development of 'a philosophy which religion has no call to chide, and which knows its friendship with science and with art'. The anti-positivist strain in classical pragmatism was at least as strong as its anti-metaphysical strain, and so James and Dewey found themselves attacked simultaneously from the empiricist left and from the idealist right - by Bertrand Russell as well as by F.H. Bradley. Both critics thought of the pragmatists as fuzzy and jejune thinkers. This sort of criticism was repeated later in the century by the disciples of Carnap, most of whom dismissed the classical pragmatists as lacking in precision and argumentative rigour.

James wrote a few remarkable essays on ethics - notably 'The Moral Philosopher and the Moral Life' (1891), in which, echoing Mill's *Utilitarianism*, he says that every desire and need has a *prima facie* right to be fulfilled, and that only some competing desire or need can provide a reason to leave it unsatisfied. But neither James nor Peirce attempted any systematic discussion of moral or political philosophy. Dewey, however, wrote extensively in this area throughout his life - from *Outlines of a Critical Theory of Ethics* (1891) to *Human Nature and Conduct* (1922) and *Theory of Valuation* (1939).

Dewey urged that we make no sharp distinction between moral deliberation and proposals for change in sociopolitical institutions, or in education (the last being a topic on which he wrote extensively, in books which had considerable impact on educational practice in many countries). He saw changes in individual attitudes, in public policies and in strategies of acculturation as three interlinked aspects of the gradual development of freer and more democratic communities, and of the better sort of human being who would develop within such communities. All of Dewey's books are permeated by the typically nineteenth-century conviction that human history is the story of expanding human freedom and by the hope of substituting a less professionalized, more politically-oriented conception of the philosopher's task for the Platonic conception of the philosopher as 'spectator of time and eternity'.

In *Reconstruction in Philosophy* (1920) he wrote that 'under disguise of dealing with ultimate reality, philosophy has been occupied with the precious values embedded in social traditions …. has sprung from a clash of social ends and from a conflict of inherited institutions with incompatible contemporary tendencies'. For him, the task of future philosophy was not to achieve new solutions to traditional problems, but to clarify 'men's ideas as to the social and moral strifes of their own day'. This conception of philosophy, which developed out of Hegel's and resembled Marx's (see Hegel,G.W.F.; Marx, K.), isolated Dewey (particularly after the rise of analytic philosophy) from colleagues who thought of their discipline as the study of narrower and more precise questions - questions that had remained substantially unchanged throughout human history.

2 Pragmatism after the linguistic turn

Peirce was one of the first philosophers to emphasize the importance of signs. 'The word or the sign which man uses *is* the man himself,' he wrote, '… my language is the sum total of myself; for the man is the thought'. But, with the exception of C.I. Lewis and Charles Morris, philosophers did not take Peirce's work on signs very seriously. Indeed, for decades Peirce remained largely unread: he had never published a philosophical book, and most of his articles were collected and republished only in the 1930s.

By that time philosophy in the English-speaking world was already in the process of being transformed by admirers of Frege, notably Carnap and Russell. These philosophers accomplished what Gustav Bergmann was to baptize 'the linguistic turn' in philosophy. They thought that it would be more fruitful, more likely to yield clear and convincing results, if philosophers were to discuss the structure of language rather than, as Locke and Kant had, the structure of the mind or of experience. The early analytic philosophers, however, accompanied this turn

with a revival of the traditional empiricist idea that sense-perception provides foundations for empirical knowledge - an idea which, at the beginning of the century, the idealists and the classical pragmatists had united in rejecting. These philosophers also insisted on a strict distinction between conceptual questions (the analogue of Kant's 'transcendental' questions), now reinterpreted as questions about the meaning of linguistic expressions, and empirical questions of fact.

It was not until that distinction was questioned by Willard van Orman Quine in his groundbreaking 'Two Dogmas of Empiricism' (1951) that pragmatism was able once again to obtain a hearing (see Quine, W.V. §8). James and Dewey had been viewed during the heyday of logical positivism as having prefigured the logical positivist's verifiability criterion of empirical meaningfulness, but as unfortunately lacking the powerful analytic tools which the new logic had made available. However, Quine's suggestion that empirical observation of linguistic behaviour could not detect a difference between necessary, analytic truths and contingent, synthetic, yet unquestioned truths helped revive the pragmatists' combination of holism, anti-foundationalism and naturalism.

That suggestion was reinforced by other publications which were roughly simultaneous with Quine's. In *Philosophical Investigations* (1953), Ludwig Wittgenstein mocked the idea that logic is both 'something sublime' and the essence of philosophy, an idea which the younger Wittgenstein had shared with Russell (see Wittgenstein, L. §8). That book also reinvigorated the pragmatists' claim that most philosophical problems should be dissolved rather than solved. Wilfrid Sellars' 'Empiricism and the Philosophy of Mind' (1953) renewed both Peirce's assault on the idea of 'immediate experience' and his claim that the intentionality of the mental is derived from the intentionality of the linguistic, rather than conversely (see Sellars, W.). In America, this article had the same devastating effect on the notion of 'sense-datum', and thus on the empiricist roots of logical positivism, that J.L. Austin's work was simultaneously having in Britain (see Austin, J.L.). The work of Sellars and Austin conspired to deprive empiricism of the prestige which it had traditionally enjoyed in the Anglophone philosophical world.

Somewhat later, Thomas Kuhn's *The Structure of Scientific Revolutions* (1962) broke the grip of the positivist notion that natural science, because it offered paradigmatically rational methods and procedures, should be imitated by the rest of culture (see Kuhn, T.S.). The effect of these various anti-empiricist and anti-positivist writings was to make many post-positivistic analytic philosophers sympathetic to Dewey's suspicions of the Cartesian-Kantian problematic of modern philosophy. Hilary Putnam, the best-known contemporary philosopher to identify himself as a pragmatist, has written appreciatively about all three classical pragmatists, praising their refusal to distinguish 'the world as it is in itself' from the world as it appears in the light of human needs and interests.

On Putnam's account, ' the heart of pragmatism…was the insistence on the agent point of view. If we find that we must take a certain point of view, use a certain ''conceptual system", when we are engaged in practical activity…then we must not simultaneously advance the claim that it is not really the way things are in themselves' (1987). Putnam holds that our moral judgments are no more and no less 'objective' than our scientific theories, and no more and no less rationally adopted. He agrees with Dewey that the positivists' attempt to separate 'fact' from 'value' is as hopeless as their pre-Quinean attempt to separate 'fact' from 'language'.

Putnam has also come to the defence of the most notorious and controversial of the classical pragmatists' doctrines: the so-called 'pragmatist theory of truth'. Peirce said 'the opinion which is fated to be ultimately agreed to by all who investigate is what we mean by the truth, and the object represented in this opinion is the real'. Putnam has revived this idea, arguing that even if we cannot follow Peirce in *defining* 'true' as 'idealized rational assertibility', the latter notion is, as a regulative ideal, inseparable from an understanding of the concept of truth. He has criticized the correspondence theory of truth by arguing that any such correspondence of a belief to reality can only be to reality under a particular description, and that no such description is ontologically or epistemologically privileged. Putnam follows Nelson Goodman in saying that 'there is no one Way the World Is'.

3 Pragmatism as anti-representationalism

Putnam is chary, however, of endorsing James' claim that '"The true"…is only the expedient in the way of our thinking, as "the right" is only the expedient in our way of behaving'. That formulation was attacked by James' contemporaries as at worst an invitation to self-deception, and at best a confusion of truth with justifiability. Dewey tried to avoid the controversy by ceasing to use the word 'truth', and speaking instead of 'warranted

assertibility'. But this did not shield him from charges of confusion and inconsistency. Russell, reviewing Dewey, said that 'there is a profound instinct in me which is repelled by [Dewey's] instrumentalism: the instinct of contemplation, and of escape from one's own personality'. He and many other critics complained that pragmatism is unable to take account of the eternity and absoluteness of truth - of the fact that a sentence that contains no demonstratives is, if true, true in utter independence of changes in human needs or purposes. Putnam's treatment of truth is designed to avoid the appearance of relativism, and to escape such strictures as Russell's.

Despite its paradoxical air and its apparent relativism, however, James' claim does bring out pragmatism's strongest point: its refusal to countenance a discontinuity between human abilities and those of other animals. Pragmatists are committed to taking Darwin seriously. They grant that human beings are unique in the animal kingdom in having language, but they urge that language be understood as a tool rather than as a picture. A species' gradual development of language is as readily explicable in Darwinian terms as its gradual development of spears or pots, but it is harder to explain how a species could have acquired the ability to *represent* the universe - especially the universe as it really is (as opposed to how it is usefully described, relative to the particular needs of that species).

In a weak sense of 'represent', of course, an earthworm or a thermostat can be said to contain 'representations of the environment', since there are internal arrangements in both which are responsible for the reactions of each to certain stimuli. But it makes little sense to ask whether those representations are *accurate*. Philosophers who take epistemological scepticism seriously (as pragmatists do not) have employed a stronger sense of 'representation', one in which it does make sense to ask whether the way in which it best suits human purposes to describe the universe is an accurate representation of the universe as it is in itself (see Scepticism).

The idea that knowledge is accurate representation and the idea that reality has an intrinsic nature are inseparable, and pragmatists reject both. In rejecting these ideas pragmatists are rejecting the problematic of realism and antirealism - the question of whether there is or is not a 'matter of fact' about, for example, mathematics or ethics, whether beliefs in these areas are attempts to correspond to reality. Whatever may be said about truth, pragmatists insist, we cannot make sense of the notion of 'correspondence', nor of that of 'accurate representation of the way things are in themselves' (see Truth, correspondence theory of).

Donald Davidson is the philosopher of language whose work is most reminiscent of the classical pragmatists' attempts to be faithful to Darwin. Davidson has said that 'Beliefs are true or false, but they represent nothing. It is good to be rid of representations, and with them the correspondence theory of truth, for it is thinking that there are representations that engenders thoughts of relativism' (1989). He has argued that we need to get rid of what he calls 'the third dogma of empiricism', the distinction between the mind or language as organizing scheme, and something else (for example, the sensible manifold, the world) as organized content - the Kantian version of the dualism of subject and object (1974). In 'A Nice Derangement of Epitaphs' (1986), an attempt to radicalize and extend Quine's naturalistic approach to the study of linguistic behaviour, he has suggested that we 'erase the boundary between knowing a language and knowing our way about in the world generally', and that 'there is no such thing as a language, not if a language is anything like what many philosophers and linguists have supposed'.

Davidson does not wish to be called a pragmatist, however, since he equates pragmatism with unfeasible attempts to reduce truth to some form of assertibility, thereby making it an epistemic concept, rather than a merely semantic one. Unlike Peirce and Putnam, Davidson thinks that we should treat 'true' as a primitive term, and should neither attempt to revitalize the correspondence theory of truth nor replace it with a better theory of truth. Davidson's strategy is summed up in his recommendation that we not say 'that truth is correspondence, coherence, warranted assertibility, ideally justified assertibility, what is accepted in the conversation of the right people, what science will end up maintaining, what explains the convergence on single theories in science, or the success of our ordinary beliefs' (1990). We should, he says in the same article, not offer an analysis of the meaning of 'true', but rather confine ourselves to describing 'the ultimate source of both objectivity and communication', namely, 'the triangle that, by relating speaker, interpreter and the world determines the contents of thought and speech'. The trouble with the correspondence theory, on Davidson's view, is that it cuts out the 'interpreter' side of the triangle, and treats truth as relation of 'matching' between speaker and world.

If one follows Davidson's advice, one can give up the pragmatist theory of truth without giving up the Darwinian naturalism which that theory was a paradoxical-sounding attempt to articulate. Such naturalism, however, entails

an abandonment of much of the problematic of contemporary philosophy. If truth is never the name of a relation (‘corresponding’, ‘representing’, ‘getting right’, ‘fitting’) which holds between sentences and non-sentences, there is no point in asking whether this relation holds for some true sentences (for example, perceptual reports or scientific theories) and not for others (for example, sentences about numbers or values). On this latter point, Putnam and Davidson are in agreement (see Truth, correspondence theory of).

Michael Dummett has suggested, plausibly, that the problematic of realism and antirealism is at the heart of the Western philosophical tradition (see Realism and antirealism). If he is right, and if Davidson is right in thinking that we should now abandon that problematic, then James’ and Dewey’s suggestions about how to end the traditional and seemingly sterile quarrels between materialists and idealists, positivists and metaphysicians, theists and atheists, science-worshippers and poetry-worshippers look more promising. The heart of both men’s pragmatism was not any particular doctrine about the nature of truth, of knowledge, or of value, but rather the hope that philosophy could renew itself by moving out from under traditional dualisms (subject-object, mind-world, theory-practice, morality-prudence) which recent science and recent social changes had, they believed, rendered obsolete.

The classical pragmatists saw themselves as responding to Darwin in the same way as the great philosophers of the seventeenth and eighteenth centuries had responded to Galileo and Newton. Philosophers such as Descartes, Locke and Kant attempted to accommodate old, precious, moral and spiritual aspirations to new scientific developments. James and Dewey thought that these attempts had been made obsolete by Darwin’s new account of the origin of our species, and that fresh attempts were needed. If one reads Quine’s and Davidson’s naturalization of semantics as a continuation of philosophy’s attempt to come to terms with Darwin, one can also read these two philosophers as continuing the larger enterprise which James and Dewey inaugurated.

4 Pragmatism and humanity’s self-image

By stepping back from its relation to traditional empiricism on the one hand and to the linguistic turn on the other, one can put pragmatism in a larger context. Much twentieth-century philosophy has been devoted to a criticism of the view, shared by Plato and Aristotle, that a capacity to know things as they really are is central to being human. Philosophers influenced by Nietzsche - notably Heidegger, Sartre and Derrida - have argued against the idea that cognition is the distinctively human capacity. Heidegger’s treatment of inquiry as a species of coping, in his discussion of *Vorhandenheit* in *Being and Time* (1927), has much in common with Dewey’s and Kuhn’s attempts to see scientific progress as problem-solving - as the overcoming of obstacles to the satisfaction of human needs, rather than as convergence towards a special, specifically cognitive, relation to reality. Both Dewey and Heidegger saw the Greek quest for certainty as debilitating. Neither granted the traditional assumption that, in addition to all the other needs human beings have, there is a need to know the truth (see Heidegger, M.).

Heidegger’s criticism of what he called ‘onto-theology’ - Western philosophy viewed as a series of attempts to find solace and support in the non-temporal - has much in common with Dewey’s criticism of what he called ‘intellectualism’. Both of these men saw the tradition which begins with Plato as a self-deceptive attempt to give the eternal priority over the temporal. So did Bergson and Whitehead, the founders of the tradition known as ‘process philosophy’, a tradition to which James (especially in his *Essays in Radical Empiricism*) made important contributions (see Process philosophy). This downgrading of the eternal is characteristic of a great deal of twentieth-century philosophy. It is found in James’ criticisms of Bradley, in Putnam’s criticism of Bernard Williams’ claim that we can use an ‘absolute conception of the world’ as a regulative ideal of inquiry, in Heidegger’s criticism of Husserl, and in Derrida’s criticism of Heidegger.

Downgrading eternity means downgrading both the idea of truth as eternal and the assumption that knowledge of eternal truth is the distinctively human activity. From a Davidsonian, as from a Deweyan, point of view, the only point of the doctrine that truth is eternal is to contrast truth with justification (which is obviously neither eternal nor absolute, because it is relative to the composition of the audience to which justification is offered, and thus to historical circumstance). But that contrast can be formulated without treating ‘truth’ as the name of a goal to be reached, or of an object to be admired. Davidson’s treatment of truth forbids us to think of inquiry as subject to a norm of acquiring true beliefs, in addition to the norm of providing adequate justification. There is no way to seek for truth apart from seeking for justification. Justification gets better as the community to which justification is offered becomes more sophisticated and complex, more aware of possible sources of evidence and more capable of

dreaming up imaginative new hypotheses and proposals. So pragmatists place the capacity to create complex and imaginative communities at the centre of their image of humanity, superseding the ability to know. Dewey and Putnam agree that the aim of inquiry is what Putnam calls 'human flourishing' - the kind of human life which is possible in free, democratic, tolerant, egalitarian societies. These are the societies in which the arts and the sciences proliferate and progress, and within which idiosyncrasy is tolerated.

The obvious difference between James, Dewey and Putnam on the one hand and Nietzsche, Heidegger and Foucault on the other - between the two most prominent sections of the twentieth-century revolt against the Greek self-image of humanity - is that these three Europeans do not share the Americans' enthusiasm for, and optimism about, liberal-democratic society. Nietzsche's, and the early Heidegger's, insistence on the resolute authenticity of the lonely individual, and their exaltation of will as opposed to intellect, are equally foreign to Dewey and to Putnam (though they have some echoes in certain passages of James). Rather than replace intellect by will, in the manner of Schopenhauer, pragmatists tend to replace knowledge by love, in the manner of Kierkegaard's contrast between Socrates and Christ (see Kierkegaard, S.A.).

For Dewey, the pragmatist who speculated most daringly, and developed the greatest historical self-consciousness, the glory of human beings is their ability to become citizens of a liberal-democratic society, of a community which constantly strives to see beyond its own limits - both with an eye to the inclusion of presently excluded or marginalized human beings and with respect to innovative intellectual and artistic initiatives. This is the capacity which most clearly sets us apart from other animals. It presupposes, of course, the capacity to use language, but for Dewey the point of having language, and therefore thought, was not to penetrate through the appearances to the true nature of reality, but rather to permit the social construction of new realities. For him, language was not a medium of representation, but a way of coordinating human activities so as to enlarge the range of human possibilities. These processes of coordination and enlargement, which make up cultural evolution, do not have a destined terminus called the Good or the True, any more than biological evolution has a destined terminus called The Ideal Life-Form. Dewey's imagery is always of proliferating novelty, rather than of convergence.

The naturalist strain in pragmatism, the attempt to come to terms with Darwin, is thus from a Deweyan point of view important mainly as a further strategy for shifting philosophers' attention from the problems of metaphysics and epistemology to the needs of democratic politics. Dewey once said that he agreed with Plato that politics was 'the science of the whole', a remark which summarized the following train of reasoning. Finding out what there is is a matter of finding out what descriptions of things will best fulfil our needs. Finding out what needs we should fulfil is a task for communal reflection about what human beings might become. Such cooperative inquiry into the possibilities of self-transcendence is best accomplished within a democratic society. So philosophers should stop asking about the nature of reality or of knowledge, and instead try to strengthen and improve the institutions of such societies by clarifying 'men's ideas as to the social and moral strifes of their own day'.

Pragmatism in ethics

Two components of the pragmatist outlook shape its ethical philosophy. It rejects certainty as a legitimate intellectual goal; this generates a nondogmatic attitude to moral precepts and principles. It holds, secondly, that thought (even that exercised in scientific inquiry) is essentially goal-directed in a way that makes the refinement of the control we exercise over how we act (for example, in drawing conclusions) integral to achieving any cognitive goal such as that of truth. This makes it possible to treat scientific inquiry as a model of how we might respond to moral problems and the reasonableness and impartiality required of a scientific inquirer as a paradigm of what may be expected in reaching moral judgments. This view of the nature of thought also inclines pragmatists to assess proposed solutions to moral conflicts in terms of consequences. But although human desires are taken as the raw material with which moral thinking must deal, it is not assumed that people's desires (what they take pleasure in) are fixed and can be used as a standard by which to assess consequences. Pragmatism is thus free to revert to a classical mode of thought (such as Aristotelianism) in which claims about human nature function as norms - a use which is made, for example, of the claim that humans are essentially social creatures.

1 James: Fallibilism

In 'Philosophical Conceptions and Practical Results' (1898), William James drew the attention of the public to a distinctive philosophic outlook which C.S. Peirce had begun to articulate in published articles twenty years earlier. Pragmatism, as Peirce had come to label his doctrines, located truth and reality at the limit of an indefinitely prolonged process of inquiry and insisted that nothing on this side of that limit could be known with absolute certainty - an argument known as 'fallibilism' (see Fallibilism). Pragmatism had the effect of undermining any claim to absolute and final cognitive authority.

James had already applied this attitude to 'ethical science' in an address, 'The Moral Philosopher and the Moral Life' (1891). Here James insisted that, as in 'physical science', we must be ready to revise from day to day the basis on which we measure and compare various goods and ills; 'no philosophy of ethics is possible in the old-fashioned absolutist sense of the term' (1891: 208). Ethical science could not in James' view aspire to delineate 'any abstract moral "nature of things" existing antecedently to the concrete thinkers themselves' (193). Good and ill were brought into the world by the feelings and opinions of conscious beings (190-1); obligation arose through the claims such beings made on one another (194); and in the best world imaginable '*every* demand' would be 'gratified as soon as made' (202; original emphasis).

As this is clearly not possible in the world in which we live, the task is to 'satisfy at all times *as many demands as we can*' (205; original emphasis). This task is carried out, however imperfectly, by following custom and judging by what is conventionally recognized as good. But although in cases of conflict there is a presumption in favour of what any given society has discovered to be a viable relative equilibrium - discoveries indeed 'quite analogous to those of science' (205) - it was clear to James 'that there is nothing final in any actually given equilibrium of human ideals' (206). "Rules are made for man, not man for rules" (James quoting T.H. Green, 206) and 'the *highest* ethical life… consists at all times in the breaking of rules which have grown too narrow for the actual case' (209; original emphasis).

To anyone who believes ethical principles are independent of human desire, perhaps even independent of God's will, this position would appear very radical. James however moved to keep his position within prevailing attitudes concerning the importance of religion to morality by declaring that God's standing as a conscious being with extraordinary attributes gave his demands a special importance in the project of 'satisfying as many demands as we can'. Even unbelievers have to recognize how belief in God inclines a person to adopt a 'strenuous mood' towards the realization of ideals; 'in a merely human world without a God, the appeal to our moral energy falls short of its maximal stimulating power' (212). James moreover hedged his radical stance on two sides. Ethical scepticism was not to be regarded as 'being one possible fruit of ethical philosophizing' (184) (see Moral scepticism). To give up the task of weaving conflicting demands into a more satisfactory system was to renounce moral philosophy. On the other hand it is incumbent on those who undertake philosophical reflection on moral principles not to apply a 'wayward personal standard' but to 'throw [their] own spontaneous ideals, even the dearest, impartially in with that total mass of ideals which are fairly to be judged' (199).

2 Peirce: Reasonableness

That we might impartially undertake the project of achieving 'ethical unity' - especially while acknowledging that the universe cannot be called upon to underwrite the hope that there is one correct outcome - is a notion that faces considerable resistance. It is particularly unappealing for anyone who holds that impartiality involves the kind of objectivity that consists in making thought conform to something antecedent to, and independent of, all thought and desire. The further suggestion that this project might have an intellectual standing comparable to that of natural science appears in this light (that of twentieth-century scientific realism) quite bizarre. In the nineteenth century, however, when it was not uncommon to regard the goal of natural scientists as consisting in an ideal refinement of (human) scientific thought rather than in the conformity of thought to an independent object, these suggestions appeared less strange (see Scientific realism and anti-realism §1).

It was in the context of such an outlook that C.S. Peirce first formulated his views on truth and reality. In an 1871 review of an edition of the works of Berkeley, Peirce distinguished two accounts of 'the real'. The first was a 'thing out[side] of the mind which directly influences sensation, and through sensation thought'; the second was what would be represented in thought if we were to prolong indefinitely the process of removing from our thought any 'arbitrary, accidental element, dependent on the limitations in circumstances, power and bent of the individual; an[y] element of error, in short' (1958: 8.12). As Peirce's thought developed he gave considerable attention to the problem of explaining how experience should constrain this development without capitulating to the first of the above views.

It might have been interesting had Peirce considered what would be involved in refining desires or demands (individuals' perceptions of their interests) through a process of inquiry, and how this project should be constrained by experience. Peirce, however, devoted little attention to the place of ethics in relation to other intellectual endeavours until the final period of his life, by which time James had made Peirce's brainchild, pragmatism, a topic of widespread and lively controversy. In papers written after 1900 (see 1958: 1.573-677) Peirce placed the values and motives that should inform inquiry in the context of wider claims, 'The only desirable object which is quite satisfactory in itself without any ulterior reason for desiring it, is the reasonable itself' (1958: 8.140), and he speculated that 'there is an energizing reasonableness that shapes phenomena in some sense… and has moulded the reason of man into something like its own image' (1966: 291). Peirce also stressed that his own primary field of endeavour, logic, which he conceived broadly as including scientific methodology, was a 'normative science'. This meant that its principles were to guide the activity of deliberate thinking (especially that in natural science) in the way that ethical principles guided action. 'I regard Logic as the Ethics of the Intellect' (1966: 415); 'logic is only an application of morality', he wrote to Lady Welby in 1908-9 (1966: 406).

3 Dewey: Consequentialism

Peirce's conception of thought as a form of human conduct was, along with fallibilism, a central feature of the outlook of those who identified themselves as pragmatists during its initial period. This conception moreover functioned within a general view of mental activity as essentially goal-directed. In his *Principles of Psychology* (1890), James had taken '*the pursuance of future ends and the choice of means for their attainment [to be] the mark and criterion of the presence of mentality in a phenomenon*' (8; original emphasis) and treated a concept in general as 'really nothing but a teleological instrument' (482). During the 1890s, under the acknowledged influence of James, John Dewey developed a position which he called 'instrumentalism' and which he was content to have identified as a form of pragmatism once there emerged a movement of that name.

Dewey's instrumentalism began with James' view, that representations (such as symbols, concepts and statements) should be treated as instruments and assessed relative to the purposes which they served, and developed from this a general account of problem-solving which characterized the aim of inquiry not in terms of discovering truth but in terms of unifying a discordant situation. The fullest version of this account is found in the sixth chapter of Dewey's *Logic: The Theory of Inquiry* (1938). This account of inquiry not only had the effect of insisting that theoretical questions be located in practical contexts, but was framed (some scholars believe primarily framed) with moral problems in mind. What James describes as the ideal resolution to a moral conflict, ('*Invent some manner* of realizing your own ideal which will also satisfy the alien demands' (1891: 205)) was for Dewey a better paradigm of the imperative of inquiry than 'Find out what is the case'.

It is important, however, to qualify this, for Dewey acknowledged to a greater extent than did James that the best resolution of a practical problem may lie in the modification of one's demands. Dewey stressed how much of moral education, as well as how much of the aim of moral reflection, consisted in making people mindful of the consequences of their conduct for themselves and for other people. The difference between 'reasonable and unreasonable desires and interests' (1939: 217) and that between the 'desirable' and the 'desired' (219) consists for Dewey in the extent to which a desire is informed by an understanding of the consequences of having it satisfied. Moral psychology commonly proceeds on the assumption that our desires are given and fixed, but 'nothing more contrary to common sense can be imagined than the notion that we are incapable of changing our desires and interests by means of learning what the consequence of acting upon them are' (218).

As a result of this outlook Dewey argued that moral thinking and thinking about values in general is structured exhaustively by the relations of means-ends and means-consequences; and he moved to subvert the widely accepted distinctions between final and instrumental values and intrinsic and extrinsic goods (1938: 214). No means adopted to achieve an end is so completely extrinsic to the experience of the people who use it that its contribution to their lives may be ignored. Nothing is so valuable in and of itself that the consequences of realizing it (including especially the consequences of whatever means are adopted towards its realization) do not need to be carefully weighed. The doctrine that there are purely final ends was for Dewey a projection of the belief that there are desires which may be taken as original and unalterable.

The claim that nothing should be regarded as a final end was intended by Dewey to prevent any component or aspect of human life from being sought in isolation from its bearing on the rest of experience. The notion of a final end also applies, however, to global features of the totality of human endeavours. One pattern of choices of means to realize our natural impulses might require more cooperative activities and move us towards greater social dependence on one another; another might require more self-reliance and move us towards less integrated ways of living with one another. Either of these global outcomes might appeal to people as final ends or intrinsic values. Questions that may be framed when the notion of final end is used in this sense can be avoided only if Dewey has some basis for thinking that a complete working out of all the means available to pursue our partially thought-out impulses, together with a complete working out of the consequences of each of the means we might adopt, will leave us with precisely one global option. Dewey did not argue explicitly for this conclusion but at the same time he did not hesitate to endorse the value of shared experience (1925: 157), and the ideal of community, as supreme (1927: 325-50).

4 Mead: Sociality

Important aspects of Dewey's philosophy were undeniably shaped by his relationship with his friend and sometime colleague George Herbert Mead. Mead developed a theory of the formation of the self and of rational thought which stressed the dependence of both on human sociality. What emerges in Mead's ethical writings is a more explicit acknowledgement than is made by Dewey that moral choices ultimately have to be assessed relative to a claim, at once factual and normative, about human nature. 'As human nature is essentially social in character, moral ends must be also social in their nature' (Mead 1934: 385). Dewey and Mead both wrote of the modification of desire as part of what was involved in developing a larger (broader) as opposed to a narrower self; 'the matter of selfishness is the setting-up of a narrow self over against a larger self' (1934: 388; compare Dewey and Tufts 1932: 302). But it was Mead who grounded the preference for the larger self in the claim about human nature. 'The escape from selfishness is not by the Kantian road of an emotional response to the abstract universal, but by the recognition of the genuinely social character of human nature' (1964: 220).

On this basis Dewey and Mead both identified themselves with movements for social reform, and Dewey achieved a degree of prominence in public life as a spokesman for a variety of causes on what was perceived as the left of American politics. As Dewey moved more into public life, logical positivism came to eclipse the influence of pragmatism in American universities. Positivism insinuated the view that truth and objectivity consist in the conformity of thought to an independent and antecedently existing reality (see Logical positivism §1). Ethical scepticism became a live philosophic option and was promoted via the claim that statements expressing moral judgments could be nothing more than expressions of subjective feeling (see Emotivism; Moral scepticism §3). Even after the vogue for positivism waned, pragmatism remained unfashionable until about 1980 when it enjoyed a modest revival under the influence of Richard Rorty. 'Neo-pragmatism' has yet to define its position on matters of

ethical theory, but its tendency to stress the values of individual and private, as opposed to communal and public, life suggests that its position is likely to represent a considerable departure at least from the pragmatism of Dewey and Mead.

Praise and blame

Praise and blame are philosophically interesting partly because, despite appearances, they are not simple opposites, but mainly because there are significant disagreements about whether, and when, they can be justified. The issue of justification connects praise and blame with some of philosophy's most central concerns: justice, desert and free will.

Disagreements about the justification of praise and blame tend to take two forms. In one the disagreement is about whether praise and blame can be justified without being deserved. Utilitarians, who argue that the rightness of praise and blame does not depend on desert, but on their contributing to the level of happiness, are opposed by those who believe that justice is of overriding value.

In its second form, the disagreement is about the essential requirements for deserving praise and blame. Among the conditions which have been proposed as essential are voluntariness (outlined originally by Aristotle), acting from the motive of duty (for praiseworthiness), and (usually in connection with blameworthiness) being free in a sense which is incompatible with determinism (the thesis that every event has a necessitating cause). Kant, who argued for both of the last two requirements, is a key figure in this debate.

1 The differences between praise and blame

Blame is a more complex phenomenon than praise. While the term 'praise' simply describes the conveying of a positive evaluation, 'blame' has a responsibility-attributing sense which is as much a part of its meaning as its evaluative component (see Responsibility).

Sometimes the responsibility-attributing sense predominates, as when a faulty carburettor is blamed for the malfunctioning of the car. But where persons are the objects, to blame is both to attribute responsibility and to censure. This does not mean that when inanimate things are blamed there is no element of evaluation: 'blame' always implies that something undesirable has occurred. But the extent to which blaming is an act of censure, as opposed (or in addition) to a judgment of responsibility is variable; whereas the extent to which praising is an act of commendation never varies, since it is just this.

Another difference is that while praise always consists in the voicing (either written or spoken) of approval, blame need not be voiced. One can blame oneself and others without saying so, because blame can consist in an attitude - for instance, the feeling of guilt which partly constitutes self-blame - or the silent passing of a judgment (as in 'She died without saying that she blamed him for the accident').

Because of these differences, blame (unlike criticism) can never simply be a negative version of praise. And although there is a considerable overlap in the constituency of objects which can be blamed and praised, there is not an exact coincidence either in the kinds of objects themselves, or the senses in which they can be blamed and praised.

2 Utilitarian versus desert theories of justified praise and blame

When philosophers disagree about the requirements for justified praising and blaming what concerns them is whether, and in what circumstances, these activities can be said to be morally right. And in considering this question they ignore some of the complexities mentioned above, to focus on those respects in which blame and praise *are* opposites - that is, to focus on blame as an act of censure and praise as an act of commendation.

There are broadly two kinds of dispute. The first is between utilitarians, who hold that the rightness of praising and blaming is to be determined by the contribution such activities make to the maximization of overall wellbeing, and those who hold that praising and blaming can only be right when deserved (see Justice; Utilitarianism). The second is over the question of what constitutes the deserving of blame and praise (see Desert and merit).

Utilitarianism regards the morality of praising and blaming, in the same way as it regards the morality of any act, in terms of the contribution these acts will make to the total level of happiness. So for the utilitarian praise and blame are morally justified if and only if they will help to increase overall happiness: they are seen as tools for encouraging beneficial (and discouraging harmful) behaviour. This means that the utilitarian could regard it as

right to blame people for things they had not done, if this was the most effective way of maximizing happiness. In other words, from the utilitarian point of view it could be right to blame someone who was (as one might say) blameless.

This view is anathema to those who regard justice as a value which should not be sacrificed for other values. To justice-valuers, the rightness of praising and blaming is determined by desert. But what is it to deserve praise or blame? In the moral context, it requires first of all that the agent should have done something morally right or wrong. This is agreed on by all non-utilitarians. It is also agreed that the act for which the agent deserves to be praised or blamed needs to have been voluntary, a view which can be traced at least as far back as Aristotle, who, as paraphrased by Ross, held that 'praise and blame attach to voluntary actions', that is, 'actions done (l) not under compulsion and (2) with knowledge of the circumstances' (*Nicomachean Ethics*) (see Aristotle §20; Will, the §1). The precise interpretation of each of these conditions of debate is a matter of debate, but for the purposes of this discussion, we can say that a voluntary act is one which has been performed knowingly and willingly.

3 Kant

But are knowledge and willingness enough? Kant (1785, 1788) held that praiseworthiness requires more: it also requires that the agent should be motivated by the thought of duty (see Duty; Kantian ethics). This suggests an asymmetry between the motivational requirements for praiseworthiness and those for blameworthiness. We do not believe that blameworthy agents must be inspired to act wrongly by the very thought of wrong-doing, as Satan was in Milton's *Paradise Lost* ('Evil be thou my Good'). Although we might regard such a motive as sufficient for blameworthiness, we do not regard it as necessary. It is considered enough, motivationally, for blameworthiness that agents were prepared to do what they knew to be wrong. But if Kant is right, it is not enough (motivationally) for praiseworthiness that they should merely have been prepared to do the right thing.

Many agree with Kant that praiseworthiness requires more than a willingness to do the right thing, but deny that praiseworthy acts must be motivated by the thought of duty, suggesting instead that such acts could have other admirable motives, such as sympathy, fellow-feeling, or a desire for justice. Kant would have agreed that these are admirable motives, but would have denied that they could be praiseworthy, because he held that praiseworthiness could be accorded only to actions which had moral worth and that such worth could not be based on any motives involving desires or other natural inclinations.

It has been argued that Kant's rejection of such motives as sources of moral worth is prompted by a concern for justice - a concern that something of such overriding value (as Kant thought moral worth to be) should not depend on the uneven and undeserved distribution of sympathetic and kindly inclinations, but should be available to all (see Impartiality). Kant's solution was to argue that the achievement of moral worth depends on the capacity to be moved by reason independently of desires and inclinations, a capacity which he appeared to think is possessed in equal measure by all adult human beings (apart from the insane) (see Self-control). Kant held that this capacity is manifested when agents are moved to act solely by the thought of duty.

4 Determinism and free will

Kant also believed (1781/1787) that blameworthiness required the ability to be moved to action independently of desires and inclinations. Here his worry was causal determinism. He held (1788) that desires are causally determining and as such inimical to the freedom required for moral accountability, in particular the freedom to have acted otherwise. The thesis that causal determinism is incompatible with such accountability (known as 'incompatibilism'), has been endorsed by many philosophers who, like Kant, are motivated at least partly by the belief that accountability requires the ability to have acted otherwise (see Free will). They argue as follows: if determinism is true, every event which has occurred, including the event of someone's acting, has had to occur; and since it would only be right to blame people for their actions if they could have acted otherwise, blame can never be justified. Kant, however, thought that blame could be justified, because he believed that the human capacity to be moved by reason (the same capacity he took to be the source of moral worth and which he thought enables us to act independently of our desires) in some way places us outside the causal order.

The latter belief has been subjected to much criticism, but many philosophers also reject the worry associated with determinism which led Kant to propose this as a solution. They argue that the essential requirement for moral

accountability is simply the ability to act as one wants to, an ability which is not threatened by determinism.

But incompatibilists are not comforted by this, for they have another worry, which is often confused with the anxiety about the ability to have acted otherwise, but which is in fact separable from it. This is the belief that the desires, preferences and inclinations which cause our actions have themselves been caused by factors for which we could not possibly be responsible. And, the incompatibilist asks, if we are not responsible for the causes of our motivational states, how can we deserve to be held responsible (to be blamed) for their results? This consideration also partly underlies Kant's insistence that blameworthiness cannot depend on desires. But his response to this worry (1793) was to claim that we have the ability to choose our moral natures; that the way we are morally is ultimately up to us, where 'up to us' means 'not dependent on any feature for which we are not completely responsible'. (Here in its fullest form is Kant's belief that in virtue of our reason, we can somehow transcend our natural, desiring, emotional selves - see Autonomy, ethical.)

The belief that we can desirelessly choose our natures (even our moral natures) has been dismissed as incoherent. But there is another model of freedom (known as 'agent-causation') which presents blameworthy agents as self-movers rather than self-choosers. The idea is that agents cause themselves to act in the light of their desires; they are not caused to act by their desires. This model too is thought to be problematic, but it is less easy to dismiss as incoherent. Both models are designed to meet the demand that there should be no contribution to an agent's actions for which the agent is not responsible.

The assumption that we cannot be morally responsible for our actions if we are not ultimately responsible for their causes (which motivates the above demand) has not received much direct attention. Those who find the assumption persuasive tend to treat it as something which does not require argument; those who do not find it persuasive tend either to ignore it, or to argue that our everyday practices of blame do not require justifications of this ultimate kind. But it could be argued that the assumption requires a more focused investigation, to determine whether it is possible either to provide a justification for it or to demonstrate that it is not tenable.

Praxeology

Praxeology belongs to the pragmatic tradition and thus emphasizes that concepts - and the world - must be understood through and elucidated in terms of human activities and practices. Praxeology is not a school but rather a movement, originating in Denmark and Norway in the 1960s and 1970s, with internal debates and disagreements. Praxeologists stress that good conceptual and ontological analyses proceed by (and are presented in the form of) careful analyses of particular examples or cases. They emphasize the situatedness of the philosopher in the world. The inspiration comes primarily from the early Heidegger and the later Wittgenstein.

The term ‘praxeology’ means here a systematic philosophical analysis and account (*logos*) of human activities and practices (praxis). Praxeology in this sense has also been labelled ‘contextual pragmatics’ and, in its more Wittgensteinian form, ‘language game pragmatics’ (see Wittgenstein, L. §11). The ‘praxiology’ of Taduesz Kotarbiński (1965) and Lange (1963), which will not be treated here, is quite different, as it aims at a general scientific theory of efficient (rational) action; a similar idea is Ludwig von Mises’ ‘praxeology’(1949), a general theory of action in the form of a generalized political economy.

Praxeology started in Norway and Denmark and is still strongest in the Scandinavian philosophical community, though it has also had a considerable influence in the German speaking world. It began in the 1960s as a discursive, analytical practice in the circle around the Norwegian philosopher Jakob Meløe (1927-), which later, in the 1970s, came to be known as ‘praxeology’.

The most important philosophical task according to Meløe and later praxeologists is careful description and elucidation of human activities in their concrete settings. ‘The adequate *philosophers*’, Meløe (1970: 20) says, ‘are Wittgenstein, Heidegger and Austin, in that order’.

The praxeological movement is characterized by an integration of influences from various philosophical traditions, particularly phenomenology - stressing the life-world-pragmatism, hermeneutics and ‘linguistic phenomenology’ (see Austin, J.L.; Phenomenological movement; Pragmatism). There exists, however, a variety of analytical orientations, covering fundamental ontology and pure conceptual analysis, as well as political-philosophical cultural critique.

Certain common convictions about the world and the best way of doing philosophy define what it is to be a praxeologist:

(1) human insights are primarily located in human activities (practices);
(2) human actions are of various, overlapping kinds;
(3) the articulation of these insights calls for careful description and further elaboration and analysis of cases of the activities in question.

The first point expresses the pragmatist’s stance. The second is the expression of an anti-reductionist attitude: there are no final and universal schemes or action-types which apply to all possible human activities. What actions there are and how they are interrelated have to be brought to the fore through an analysis of particular cases.

Praxeology emphasizes the internal nature of the relation between an agent, the activity, the equipment and instruments, the material used or transformed and the context or ‘landscape’ in which the agent acts. From the point of view of praxeology an object *is* an object-as-used, an agent*is* a person-as-acting, the world *is* the world-as-we-act-and-live-in-it, and so forth. One source of inspiration here is Heidegger’s discussion about tools (*Zeug*) in *Sein und Zeit (Being and Time)* (1927) (see Heidegger, M. §3).

A knowing agent is seen as a constitutive element of an activity. Jakob Meløe says about somebody who is making shoes:

> He sees what he needs to see to do what he does, he masters what he needs to master to do what he does, he knows what he needs to know to do what he does, etc. I abbreviate all this to: he *knows* what he is doing - and let it stand as an axiom that *the agent* knows what he is doing.
>
> (1970: 23)

Furthermore, *in knowing this* agents also know *the world* they are acting in. Gunnar Skirbekk (1993: 153) calls the 'axiom' *the praxeological thesis*. This necessary and 'activity-constitutive' knowledge is to a large extent tacit (see Knowledge, tacit).

Praxeology is anti-sceptical, and as part of that anti-solipsistic, in the sense that praxeologists take it as their starting point that on the whole we know what we do in our life-world and that one person's knowledge is also accessible to others. Jakob Meløe writes:

> In a society with a complex division of work, we are all of us poor observers of the doings of most of our fellow men…. But also, there are no two jobs, or no two sets of practices, with no forms in common between them. And that is what makes our world one world.
>
> (1970: 26)

The third point above expresses the praxeological method as well as the contextualist stance of praxeology. From the point of view of praxeology an activity is always situated in a context and cannot be understood as the kind of activity it is unless it is understood as an *activity-in-that-context*.

The method of praxeology is the exhibition of what is constitutive of or essential to a certain activity through a minute analysis of *examples*. This amounts to an exhibition of what is 'inherent' or necessarily presupposed in an activity. The goal is to *show* this rather than to prove it.

The particularistic and contextualistic nature of praxeology has led to vivid debates, especially in Norway and in Germany (Böhler *et al.* 1986; Skirbekk 1993), between praxeologists and representatives of transcendental and universal pragmatics (Apel, Habermas and their followers). Praxeology seems, for example, to make very strong, in some sense universal, hermeneutic claims about communication and knowledge.

Meløe's statement about what makes our world one world is a good example. Some praxeologists deny that any such universal 'theoretical claim' have been made at all. What seems to be a general presupposition is said to exist only as analytical *practice*. Some praxeologists, however, accept and stress the existence of universal presuppositions (Skirbekk 1993).

Prayer

The concept of prayer is now most commonly applied to any sort of communication which is addressed to God. That is, prayer is that activity in which believers take themselves to be speaking to God. One may ask God to do something (petitionary prayer), but that need not be the only sort of content that prayer may have. There are prayers in which one thanks God for something, and others in which one praises God and expresses one's adoration. A worshipper may also pray to express (or to make) a commitment to God, or to make a vow. Penitents pray to confess their sins, to express their repentance, and to ask for divine mercy and forgiveness. In general, any sort of speech-act which might be addressed by one human being to another could also be addressed to God, and thus be a prayer. Some such acts (such as, perhaps, commanding) might be thought inappropriate when addressed to God, but no doubt there can be inappropriate prayers. And some prayers may even be tentative and unsure about the existence of the addressee, prayers which might be thought of as beginning 'O God, if there is a God… '.

Some writers, principally from within a tradition of mysticism, also apply the notion of prayer in a somewhat broader sense - in, for example, expressions like 'prayer of quiet' and 'prayer of union'. Here 'prayer' seems to mean any intentional state - worship, adoration, enjoyment of the divine presence and love, and so forth - which the worshipper believes to be associated with a genuine contact with the divine, regardless of whether it contains an element of communication addressed to God.

In the sense of a communication addressed to the divine, prayer seems to fit best with the theistic religions, which construe God as a person, or as something like a person. Here the addressee is taken to be someone who is an appropriate recipient of a communicative act. The fit seems rather more awkward in those religions which construe the divine reality in impersonal terms. With reference to prayer in the theistic religions, a principal topic of philosophical interest involves the omniscience and benevolence of God - if he knows all my needs and desires, why inform him of them through prayer? And will he not satisfy all my needs regardless of whether I pray? If divine benevolence is conditional on prayer, it seems less than perfect. A response to the first question is to point out that not all speech-acts need be construed as conveying information; a response to the second is to argue that our having to ask for things on behalf of ourselves and others might make for a better world than if this were not the case. Another issue is the way in which God responds to prayer. Some argue that God responds through miracles; others suggest that God, knowing our future prayers, providentially created a world that would satisfy them - thus prayer causally influences earlier events.

1 Prayer and divine omniscience

The doctrine of divine omniscience, which is often a part of orthodox Christian theology, claims roughly that God knows every truth that is knowable. Most theologians have held that this includes all the truths about the future, including truths about the future acts of free creatures (see Omniscience). If God is omniscient in this way, then in prayer one does not inform God of something which he did not already know. Before one prays, God already knows what one wants, what one needs, what one will say in the prayer, what one will do, and so on. At this point, however, we must be careful. The divine foreknowledge may anticipate human action in the order of time, but it cannot substitute for that action, in the sense of making it irrelevant whether the action is actually done. For if the action were not done, then the divine knowledge would have been different from what it actually was. This applies to prayer as much as to anything else.

So perhaps God knows now that I will confess my sins tomorrow. But God knows this only if I will actually confess my sins tomorrow. If, when tomorrow comes, I do not confess, then God never knew that I would confess tomorrow. My action, so far from being made irrelevant by the foreknowledge, is instead essential to that foreknowledge.

It is true, however, that when in prayer I confess my sins, or express my desires and needs (or what I take to be my needs), and so on, I am not informing God of things which he did not already know. He already knew about those sins, he knew what I wanted, and what I thought I needed, and what I really needed. So there may be a problem about the point, the significance, of the practice of prayer in the light of the alleged omniscience of God.

Now it is true that the point of some human conversation is that of communicating information (or misinformation)

to a hearer who did not previously know it. But that is certainly not the only point of speech within a purely human context. It is not even the only point of speech in the declarative, indicative mood. Students who respond to a teacher's classroom question are often not informing the teacher of something the teacher does not already know. Nor, in such cases, do the students even suppose that this is what they are doing. They are attempting to demonstrate or to exhibit their own knowledge of the subject matter, not to extend the teacher's grasp of that subject matter.

Closer to much religious praying, when I have wronged someone, and I apologize to that person for what I have done, the apology usually includes a statement of what was done. But the hearer is often already painfully aware of what was done, and I know that this is the case. I am not trying to make the hearer aware of what was done. But the apology involves my acknowledging what I did, and I do that by saying what I did. My statement has a point, though its point is not that of conveying new information. The point of the confession is that I 'own up' to what I did, that I acknowledge the responsibility for it. And that is a prerequisite for, or perhaps a part of, a sincere apology. In a similar way, when I congratulate someone on an achievement, I normally say what the achievement was. It is not that I think that the hearer is unaware of the achievement. But the congratulation loses much of its punch if it is not conversationally pegged to the item that gives rise to it.

The fact is that human speech, even within a purely human context, is extremely varied and flexible. If we are to take seriously the practice of prayer, then we need to allow for at least a similar degree of flexibility in the human address to God.

2 Prayer and divine benevolence

The concern about divine benevolence, in connection with prayer, arises primarily with reference to petitionary prayer, in which the worshipper asks God to do something. I ask God to do something for me, or for someone else, something which I presumably think will be good for the recipient. But we may think that if God is fully benevolent, then he already (and independently of my prayer) wants to do what is good for me and for the rest of the world. Furthermore, because of his omniscience, he already knows (independently of my prayer) what would be good for all of us. Is there any way, therefore, in which my prayer could be relevant to whether God does the thing for which I ask?

If there is any truth at all in the claims that God exists and loves his creation and knows what all of us need, then indeed there must be many good things which God does for us without our asking him. Many of the things which are in fact necessary for my life, health and happiness are things of which I am completely unaware. Even if I spent all of my time praying and did nothing else, I could not pray for all of those things. So it seems implausible to think that God does only those good things for which we pray. And there may also be things for which we pray, and which God does, but which he would have done for us anyway because he is good and he loves us.

There may, however, be another class of things. These are the things that it would be good for God to do for us *if we ask him*, and it would not be good for God to do them otherwise. These would be divine acts whose goodness was constituted, in whole or in part, by the fact that we have prayed for them. Or, to look at it from the other direction, they would be good because they were divine responses to human requests. If there are things which belong in this category, then our praying for them is not irrelevant to whether God does them.

There seem to be analogous things within purely human contexts. No doubt parents do many good things for their children, regardless of whether the children ask them - before, indeed, the children are mature enough to ask. But if the children are to grow into a genuinely personal relation with their parents, then some of the initiative must shift to the other side. Making a request of another person, and then acknowledging the response with thanks, is part (of course, it is only a part) of growing into actuality as a person oneself. Petitionary prayer seems to be based on the conviction that human beings are invited into an analogous sort of personal interaction with the divine person.

The difficulty regarding prayer and divine benevolence may be more severe when we think of praying for good things - healing, for example - for someone else. It may seem puzzling that a good thing which God might do for another person might depend in any way on *my* requesting it. Here too, we must remember that if there is anything at all to the theistic view of the world, then God must be doing many good things for each of us regardless of whether anyone prays for them. But it may also be the case that part of the divine purpose for the world - a good purpose - is that we should grow into a genuine community, a community of mutual love. That would be a

community in which each of us does good things for the others, including the good of praying for the others, and each of us also receives with thanks this service from the others. It might be said that in such a community we all ‘take in each other’s washing’. Maybe in some deep way it is better that I do someone else’s washing, and they do mine, than for each to do our own. If so, then there may be things which, in the end, it would be good for God to do for me if someone else asks for them, and not otherwise.

So far the relation of prayer to the divine benevolence has been discussed as it might appear to someone primarily concerned to understand this aspect of religious faith. But these concerns may also arise in a more polemical context, one in which these problems are incorporated into some special version of the problem of evil (see Evil, problem of §§1, 6). In that context, some alleged difficulty about prayer would function in an argument which was intended to cast doubt on the existence of God, or on the divine benevolence or power, and such like. Initially at least, cases of ‘unanswered’ prayer - cases in which we have prayed for good things, and those good things have not happened - seem to be the most plausible cases on which to focus. And it seems that there are many such cases. Think, for example, of all those who have prayed for peace while wars continue to abound. On reflection, however, we may well come to think that there is nothing special in this version of the problem of evil. We can readily think of many good things (or things, at least, which seem to us to be good) which God has evidently not done in the world. If that fact is really incompatible with the existence or goodness of God, then theism is already in terrible difficulty, and adding a few more cases of good things for which we have prayed will probably make little difference to the logic of the situation.

If, on the other hand, we can think of something which blunts the force of the general form of this problem, then probably the same sort of thing can be said about unanswered prayers. If, for example, it is relevant and useful to point out that we may be mistaken about what really would be good for us or for the world, then it would be equally relevant to observe that we may make similar mistakes when we pray for what we think is good. So the case of unanswered prayer probably does not generate a significantly different version of the problem of evil.

Curiously, however, the case of ‘answered’ prayer might be a more promising candidate for generating a special and distinctive variety of that problem. For we may think that, in some cases at least, the good thing that was done would not have been done without the prayer, and we may then construe that possibility as incompatible with divine benevolence. We might think, therefore, that we have discovered a special and curious fact about the world, that of good things done in response to prayers, which cannot be fitted into a more or less orthodox theistic view of the world.

There is, of course, a very large literature about the problem of evil, and it continues to be a live topic of controversy in the philosophy of religion. It is useful to keep in mind, when engaging in this controversy, the difference between a theodicy and a defence (see Hick 1966 and Plantinga 1967). Roughly, a theodicy is an attempt to explain, from a theistic point of view, why there is evil in the world, why God permits it, and so on. That is a relatively ambitious project, and one of the requirements for succeeding in it is that the explanations we give should be true - that is, that we correctly identify the divine intentions and purposes in allowing evil.

A defence, on the other hand, is more modest. Defenders attempt merely to refute some anti-theistic argument from evil by showing that it is invalid or that it has some false premise. Defenders may choose not to propose any positive explanation of their own as being the true account of evil. Perhaps they will not even claim to know any such account. They may instead content themselves with pointing out that there are some possible explanations which are compatible with the facts of the world. If there are possibilities of that sort, then the facts of the world (including the evils) are not logically incompatible with the existence and benevolence of God.

It was suggested above that there may be things which it would be good for God to do in response to a prayer, and not otherwise. If we construe that as the actual explanation for the phenomenon of answered prayer, then it would constitute a partial theodicy, a theodicy for that particular curious fact about the world. But the mere logical possibility of such things, even if there actually are no such things, could serve as the basis for a defence. That is, the fact that such cases are possible would show that cases of answered prayer are not by themselves incompatible with the benevolence of God. It does not seem, therefore, that prayer contributes any serious special element to the problem of evil. If we can find a satisfactory theodicy or defence as a response to the more general versions of the problem of evil, then that line of response will probably cover the case of prayer as well. And if there is no satisfactory theodicy or defence for the more general versions, then there will be plenty of trouble for theism

regardless of what we say about prayer.

3 Prayer and the natural order of the world

The notion of God's doing something in the world has been prominent in the last few paragraphs, and that can hardly be avoided in discussions of petitionary prayer. For such prayers - 'Give us this day our daily bread', for example - characteristically ask God to do some more or less specific thing in the world. Perhaps the most purely 'spiritual' requests - 'Forgive us our sins', for example, or 'Receive us into the heavenly kingdom' - can be thought of as being divorced from the natural world and independent of what happens in it. But much petitionary prayer pretty clearly involves that world. There does not seem to be any plausible way of thinking about such prayer without also thinking about the possibility, or impossibility, of God's responding by way of some action in the natural world.

One such possible mode of divine response would be that of a miracle. Here a miracle will be construed as a direct and *de novo* causal or quasi-causal act of God which makes the natural world different from what it would have been, given only the other elements of the world and the ordinary causal laws and powers operative within it. This is close to the 'violation' concept which David Hume was trying to formalize in his celebrated definition, 'A miracle may be accurately defined, a transgression of a law of nature by a particular volition of the Deity, or by the interposition of some invisible agent' (1748, section X). Since Hume's time there has been a large amount of discussion of the possibility, actuality, significance, and so forth, of miracles in this sense (see, for example, Swinburne 1970). This topic is much too large to broach here, but it can be said that many participants in the practice of prayer consider this as one possible mode of divine response (see Hume, D. §2; Miracles).

Many theologians seem also to recognize another, non-miraculous, mode of response, which is sometimes called 'providential' (see, for example, Lewis 1947: Appendix B). The idea here is that the divine response to a petitionary prayer may consist of an event which happens in the 'ordinary' course of nature, through the operation of ordinary causes. So, for example, my recovery from an illness - prayed for by me and my friends - may happen by what seem to be the regular and ordinary effects of drugs, surgery, and so forth. But in what sense could the recovery then be a divine response to the prayer? Well, the course of the world may be thought to be determined by three sorts of factors - the laws of nature, the 'initial conditions' of the world, and the acts of free agents. (Some might want to include a fourth category, that of chance events. In this context, they can be handled in the same way as free acts.) Suppose we think also that God creates a world, in part, by creating laws of nature and initial conditions. He knows what future acts will take place in that world; in particular, he knows whether I and my friends will pray for my recovery from the illness. If then he arranges the laws of nature and the initial conditions in such a way that my recovery ensues, and if our prayers were a factor entering into the divine decision, then my recovery would be providential, and an answer to prayer, though it occurred in the ordinary way because of drugs and surgery.

This idea requires that we allow for the possibility of an event's playing a role in determining some previous event or state of affairs. So my prayer now is to be one of the factors that God considers in setting up the world 'in the beginning'. But this is probably not a special problem for prayer. For the most straightforward way of thinking about divine foreknowledge is to think that my action today determines something of what God knew yesterday and throughout all previous time. If I had done something different today then the divine knowledge would forever have been different - forever in the past as well as in the future.

Some prefer to resolve this problem by appealing to the idea that God is eternal, rather than, say, merely everlasting (see Eternity). And an eternal being is 'outside' time - for such a being there is no before or after. This, then, removes the 'fore' from the divine knowledge, and perhaps removes with it the feeling of a 'retrograde' causality in which my present act determines a previous state of knowledge in God. This appeal, of course, has its own difficulty; the idea of eternity is notoriously difficult to understand. But we have no guarantee that every truth is easy. Others (for example, Mavrodes 1984) prefer to accept the idea of temporally retrograde causality, or something like causality, in which future events play some role in shaping the world that comes before them. Perhaps the most interesting philosophical question in this connection is that of whether we can find any reason for a decisive rejection of this possibility.

Predestination

Predestination appears to be a religious or theological version of universal determinism, a version in which the final determining factor is the will or action of God. It is most often associated with the theological tradition of Calvinism, although some theologians outside the Calvinist tradition, or prior to it (for example, Augustine and Thomas Aquinas), profess similar doctrines. The idea of predestination also plays a role in some religions other than Christianity, perhaps most notably in Islam.

Sometimes the idea of predestination is formulated in a comparatively restricted way, being applied only to the manner in which the divine grace of salvation is said to be extended to some human beings and not to others. John Calvin, for example, writes:

> *We call predestination God's eternal decree, by which he compacted with himself what he willed to become of each man. For all are not created in equal condition; rather, eternal life is foreordained for some, eternal damnation for others. Therefore, as any man has been created to one or the other of these ends, we speak of him as predestined to life or to death.*
>
> *(Institutes, bk 3, ch. 21, sec. 5)*

At other times, however, the idea is applied more generally to the whole course of events in the world; whatever happens in the world is determined by the will of God. Philosophically, the most interesting aspects of the doctrine are not essentially linked with salvation. For instance, if God is the first cause of all that happens, how can people be said to have free will? One answer may be that people are free in so far as they act in accordance with their own motives and desires, even if these are determined by God. Another problem is that the doctrine seems to make God ultimately responsible for sin. A possible response here is to distinguish between actively causing something and passively allowing it to happen, and to say that God merely allows people to sin; it is then human agents who actively choose to sin and God is therefore not responsible.

1 What is predestination?

The idea of predestination belongs to a group of theological ideas which are closely related (if, indeed, they are not practically identical). Among them are foreordination (which is often used merely as a stylistic variant of predestination), divine election (the divine choosing of some persons to receive the gift of salvation), divine providence, the divine governance of the world, divine decrees and divine sovereignty. Perhaps a little more distantly related is the idea of divine foreknowledge (a special case, presumably, of divine omniscience). Sometimes one of these ideas is defined in terms of some of the others. But all of them seem to be special theological concepts, and this method of definition is not very useful to someone who is trying to make an initial entry into this set of ideas.

Calvin, however, in the passage quoted above, speaks of God as having 'compacted with himself what he willed to become of each man'. Similarly, the *Westminster Shorter Catechism* defines a divine decree as 'His eternal purpose according to the counsel of His will, whereby, for His own glory, He hath foreordained whatsoever comes to pass', a definition endorsed in the twentieth century by the prominent Calvinist theologian Louis Berkhof (1959: 102). Perhaps we can make a start, therefore, by thinking of predestination as something like a divine intention about how things should happen in the world. This intention belongs to eternity, or at least it predates the events to which it refers. Calvinist theologians usually add that this divine will is efficacious, in the sense that whatever is decreed, predestined, and so on, is certain to happen in just that way. This efficacy is sometimes said to be mediated through another divine act, the governance of the world.

Put in this way, the doctrine seems fairly straightforward, and makes a strong claim about the way in which the course of the world is related to the divine will. In response to an objection, however, many theologians introduce an important revision, which greatly weakens the idea. This revision will be considered in §3.

2 Sources of the doctrine

The doctrine of predestination appears to have four main sources:

(1) Certain biblical passages, most notably in the Pauline epistles, but also in some other places (Boettner (1948)

cites all of these).
(2) Speculation based on rather general considerations about the divine nature and activity - God's creation of the world, his power, his majesty, and so on. A classic example is that of Thomas Aquinas, who argues that 'since every agent acts for an end, the ordering of effects towards that end extends as far as the causality of the first agent extends'. But God is the First Cause, whose causality encompasses that of all created agents. And so 'it necessarily follows that all things, inasmuch as they participate in existence, must likewise be subject to divine providence' (*Summa theologiae* Ia, q.22, a.2).
(3) Speculation and argument based on a different special attribute of God, namely his foreknowledge of all future events. 'Foreknowledge implies certainty, and certainty implies foreordination' (Boettner 1948: 44).
(4) Empirical observations of religiously significant facts about the world - for example, that various people, because of the circumstances of their birth, their culture, and such like, have vastly different opportunities for hearing and understanding the Christian message, that there is a great disparity in the responses of people who do hear that message, and so on (see, for example, Calvin's *Institutes*, bk 3, ch. 21, sec. 1).

The second and third of these lines of argument, especially, would seem to support the most general and extensive versions of predestination, if they support any at all.

3 Objections and emendations

From early on in the history of the Church - apparently, indeed, from at least the time of the writing of the Pauline epistles - various objections have been raised against the doctrine of predestination. These include:

(1) That it is inconsistent with other passages in the New Testament, such as those which suggest that all human beings will eventually be saved (Boettner (1948) cites and discusses some of these passages, as well as some of the other lines of objection).
(2) That it is incompatible with the justice and/or the love of God, because it represents the divine choice and action as arbitrary and unfair.
(3) That it is incompatible with human moral responsibility, because it implies that there is no human free will (see Free will).
(4) That it impugns the character of God, by making God morally responsible for sin (see Omnipotence §5).

One of the most serious difficulties which faces a person who considers these objections, and possible replies to them, is that of getting a clear idea of just how strong a claim is made by the doctrine of predestination. The idea of predestination has the 'feel' of a causal, or quasi-causal, notion. Initially at least, we tend to think that it is being used to provide a causal explanation of certain facts in the world. Why did this person receive the Gospel when that one did not? Ultimately, at least, it was divine predestination, the divine decree, which had these results. Sometimes this sort of claim seems quite explicit:

> An effect conceived in posse only raises [*sic*] into actuality by virtue of an efficient cause or causes. When God was looking forward from the point of view of His original infinite prescience, there was but one cause, Himself. If any other cause or agent is ever to arise, it must be by God's agency. If effects are embraced in God's infinite prescience, which these other agents are to produce, still, in willing these other agents into existence, with infinite prescience, God did virtually will into existence, or purpose, all the effects of which they were to be efficients.
>
> (Dabney 1871 (1985): 212)

Often, as in this passage, the idea is developed by suggesting that God is the remote cause, the first cause, who determines all subsequent events by initiating a deterministic chain of causes and effects. This chain terminates in (in many cases) the actions of human agents, who are the proximate causes of events.

This sort of claim seems, of course, to generate immediately the third and fourth sort of objection mentioned above. With reference to free will, some writers (Luther seems to be a prominent example) seem content to accept the implication and to deny that there is any real free will. Others avail themselves of the idea sometimes called (in non-theological contexts) 'soft' determinism. They argue that God determines human acts by determining the motives, desires, and so forth, of human beings. Since humans then act in accord with their own desires and motives, they act 'freely', despite the fact that their acts are determined by a divine act from before the foundation

of the world.

Perhaps the other objection, that this view makes God responsible for sin because it makes him the cause of each sinful act, seems more troublesome to proponents of predestination. There is a tendency for writers on this topic to put forward very strong and extensive claims about predestination, and to offer arguments which, if they are sound, support these very strong claims. But later, under the pressure of objections, they fall back on versions of the doctrine that seem to be radically revised and weakened.

An example of such a revised version appears in the *Westminster Confession of Faith* (1646), which says that:

> God from all eternity did, by the most wise and holy counsel of his own will, freely and unchangeably ordain whatsoever comes to pass; yet so, as thereby neither is God the author of sin; nor is violence offered to the will of the creatures; nor is the liberty or contingency of second causes taken away, but rather established.
>
> (*Westminster Confession of Faith*, ch. 3)

This is evidently an attempt to address objections of the third and fourth types mentioned above. If we are to take it seriously, however, we may well be puzzled as to how we are now to understand the claim that God ordains all things. If God is not the author of sin, then it would seem that there are a great many events in the world of which God is not the author. And we may also wonder whether, if the world can have in it some sins of which God is not the author, it may not also have in it many other events of which God is not the author. Furthermore, what shall we say now of those arguments - from foreknowledge, for example - which would seem to include within the scope of the divine determination sins as well as anything else? If we take seriously the qualification that ‘neither is God the author of sin’, and so on, then what remains in our understanding of what divine foreordination amounts to?

In saying this, we may, on the other hand, be too careless and hasty in our understanding of the term ‘author’. Could God be the cause of everything without being the author of everything? If so, then we could retain the *Westminster Confession* qualification while still accepting the arguments for God’s universal causal responsibility. But in order to be relevant to the problem that is being addressed, authorship must be understood as generating moral responsibility for what one is the author of, while foreordination (or causality) without authorship must not generate such responsibility. What understanding of foreordination and authorship will satisfy these requirements?

One way of proceeding would be to construe foreordination as a very general sort of causal notion which includes at least two kinds of cause. One of them, authorship, is the sort that generates moral responsibility, and the other is the sort that does not. We have already mentioned two sorts of cause, remote and proximate. God was said to be the remote cause of everything, while (in many cases, at least) created agents were the more proximate causes. Unfortunately, however, this distinction does not have the right moral implications. Remote causes drain moral responsibility away from proximate causes. To construe authorship as proximate causality, and thus to say that God is not the proximate cause of sins, would have the opposite effect from that which the defender of predestination needs. The moral responsibility for sins would be transferred from the human agents to God, the remote cause.

A more promising strategy appeals to a different distinction. This is sometimes put as the difference between positive and negative causality, or between active and passive causality, or between causing something and merely allowing it to happen. This strategy is attractive because this distinction really does seem to have the required moral implications. The morality of doing an act yourself may be very different from that of merely allowing someone else to do a similar act, and actively causing something to happen may be morally different from merely allowing it to happen. So a nineteenth-century apologist for predestination says:

> To decree, is nothing more than to determine beforehand, or to foreordain; and, to resolve, or determine to do or permit anything, is to decree it in that sense…. That which is determined to be done, is decreed; and that which is determined to be permitted, is also decreed, when there is power to prevent it…. Now, in one or other of these ways, God ‘has foreordained whatsoever comes to pass.’ This, as you know, is the simple language of our catechism.
>
> (Smith 1854: 32-6)

And according to the Calvinist theologian Louis Berkhof, ‘the decree respecting sin is not an efficient but a permissive decree, or a decree to permit, in distinction from a decree to produce, sin by divine efficiency’ (1959:

108). Long before either of these, Thomas Aquinas had argued that reprobation (the predestination of some humans to damnation) was not the cause of the sinner's sin, although predestination was the cause of the elect's receiving grace. He says that predestination includes the will to confer grace, but of reprobation he says only that it 'includes the will to permit a person to fall into sin' (*Summa theologiae* Ia, q.23, a.3).

The crucial words in these accounts, of course, are 'permit', 'permitted', 'in one or other of these ways', and so on. What God permits may indeed be done by the free will of human beings, and perhaps it is then those human agents, and not God, who bear the moral responsibility for those acts. This really does undercut the objections that say that predestination makes God morally responsible for sin, or that it eliminates the free will of creatures.

But 'the simple language of our catechism' used what appear to be very strong notions - foreordination, predestination, divine election, and so on. One may be surprised to hear now that these apparently powerful claims about God can be satisfied merely by God's *allowing* other agents to act. At least, interpretations of this sort suggest that the doctrine of predestination may not be nearly as strong as it first appears, and that it is one which may be unusually prone to misapprehension.

Predicate Calculus

The central feature of the 'predicate calculus' is a formal language designed to represent arguments involving generalizations. Aristotle had developed a formal logic of 'every', 'some' and 'no', but did not tackle the problem of combining these quantifiers (as they are now called) with relations, or with complex predicates, as in 'Everyone is F or G'. The Stoics had the beginnings of a sentential logic - the logic of the connectives 'and', 'or', 'if' and 'not' - which could later be adapted to deal also with complex predicates. The solution is not, however, a simple matter of pasting these two systems together. It involved four major steps. One was Boole's groundwork for a mathematical system of sentential logic by analogy with an algebra of truth and falsity. Another was De Morgan's move away from the traditional subject-predicate paradigm towards a relational one, so that relations of the form '__ loves __' could be treated naturally alongside predicates such as '__ is mortal'. The third was the invention by Peirce and Frege of the quantifier-and-variable notation. This solved the twin difficulties of adapting sentential logic to express complex predicates, as in $(\forall x)(Fx \vee Gx)$*, and linking the quantifiers unambiguously to the right clauses in multiply general sentences, for example, '* $(\forall x)(\exists y)$*x loves y' and '* $(\exists y)(\forall x)$*x loves y' as alternative renderings of 'Everyone loves someone'. Finally there was Frege's break with the traditional semantics of quantified terms. Instead of treating 'every man' as the subject of 'Every man is mortal', he treats it as a second-level predicate governing the first-level predicate 'is mortal'. At one stroke this obviates the futile search for an entity answering to 'everyone' and provides the rationale for disambiguating multiply general sentences.*

Frege and Peirce catered for quantification not merely over individuals but over properties, relations and functions of individuals, and Whitehead and Russell carried this further to cover quantification over relations of relations, and so on. These would now be called second-order or higher-order predicate calculi as opposed to the first-order predicate calculus - often simply called 'the' predicate calculus - with which this entry is primarily concerned.

One can give a mathematically precise characterization of the valid argument forms of the predicate calculus. That has become a kind of standard for demonstrating the logical validity of informal deductive arguments, and the semantics of the predicate calculus is the starting point for contemporary philosophy of language. Moreover, the analysis of argument that leads to and incorporates the predicate calculus is the most successful piece of philosophical analysis completed in modern times, and as such serves as a paradigm - for some to be emulated, for others to be avoided, but in one way or another central to the development of contemporary philosophy.

This entry concentrates on the central theme of the analysis of logical validity through an account of what it is for an argument 'form' of the predicate calculus to be valid.

1 Language of the predicate calculus

The notation used here is that of the Hilbert school. A commonly used alternative, derived from Peano and Russell, employs $\sim$ for negation, & for conjunction, $\supset$ for the conditional, $\equiv$ for the biconditional and $(\ )$ for the universal quantifier.

We build up the formulas of the predicate calculus from atomic formulas using the sentential connectives and quantifiers. To start with we need a stock of enough variables: $v_0, v_1, \ldots, v_n, \ldots$. The language may contain constant symbols and relation symbols. (One can also allow function symbols, which would be necessary, for example, for a standard treatment of arithmetic.) Let the constant symbols be $c_0, c_1, \ldots, c_n, \ldots$. Although the sentential connectives and quantifiers are often referred to as logical constants, in this entry, 'constant' always means a non-logical symbol serving as a name or potential name for an individual. Let the relation symbols be $R^n_0, R^n_1, \ldots, R^n_m, \ldots$. Those with a superscript of *n* are called *n*-placed and will be used for *n*-ary relations. One-placed or 'monadic' relation symbols may be called predicate symbols. It is convenient to bring the sentence letters of the sentential calculus (see §3) under this uniform notation by regarding them as zero-placed relation symbols. A 'term' is either a variable or a constant. (It will be assumed here that the language of the predicate calculus contains, as well as any non-logical relation symbols, the equality sign '=' used to denote the logical relation of identity. Some writers would call this 'predicate calculus with identity', keeping 'predicate calculus' for the version in which the equality sign is absent or in which identity is not given the special status of a logical

relation.)

An ‘atomic formula’ is an expression either of the form $s = t$, where *s* and *t* are terms, or of the form $R^n v_1 v_2 \ldots v_n$, where $v_1, \ldots, v_n$ are terms, for some *n*. For example, $R^2 vc$ might be used for ‘*v* is the daughter of Margaret Sanger’, where R^2 stands for the daughter relation and *c* stands for Margaret Sanger. (Here and elsewhere we shall omit the official apparatus of subscripts for the sake of simplicity of exposition.)

The constants and relation symbols function here as schematic letters that may receive varying interpretations, but there is nothing to block fixing the interpretations of some of them in a definite way, which results in an interpreted language of a sort more closely related to ordinary language. The system with only schematic letters, those without a fixed interpretation, is known as the ‘pure’ predicate calculus, while systems with symbols that have fixed interpretations are known as ‘applied’ predicate calculi. Frege considered only applied predicate calculi without any schematic letters. Hilbert introduced and emphasized the importance of the device of schematic letters.

If ϕ and ψ are formulas, then so are those expressions formed as indicated using the sentential connectives: $\neg\phi$, $\phi \wedge \psi$, $\phi \vee \psi$, $\phi \to \psi$ and $\phi \leftrightarrow \psi$. If ϕ is a formula and *x* is a variable, then $(\forall x)\phi$ and $(\exists x)\phi$ are *quantified* formulas and the occurrence of ϕ is said to be the ‘scope’ of the quantifier. The symbols are formal counterparts of the English ‘not’, ‘and’, inclusive ‘or’, ‘if… then’, ‘if and only if’, ‘for all’, and ‘there exists at least one’, respectively. An occurrence of a variable *x* in a formula that is not in the scope of any quantifier over *x* (that is, a quantifier of the form $(\forall x)$ or $(\exists x)$) in the formula is said to be a ‘free’ occurrence, and a quantifier over the variable *x* in a formula is said to ‘bind’ every occurrence of *x* free in its scope. Such an occurrence (including the occurrence of *x* inside the quantifier itself) is then said to be ‘bound’ by the quantifier.

Some formulas are incomplete expressions, such as $R^2 vc$, which might be used for ‘*v* is a daughter of Margaret Sanger’, in which *v* is left free, while others are complete sentences and may be true or false on their own, such as $(\exists v)R^2 vc$, ‘Margaret Sanger has a daughter’ (literally, ‘There exists *v* such that *v* is a daughter of Margaret Sanger’). That distinction can be made precise as follows: a variable ‘occurs free’ in a formula ϕ just if any of its occurrences in the formula is free. A ‘sentence’ is a formula in which no variable occurs free. Thus, while the sentential connectives may on occasion indeed connect sentences, they may also connect formulas that are not sentences.

2 Logically valid arguments and interpretations

An argument is ‘valid’ if it is impossible that the premises be true and the conclusion false. Validity is the central feature of good deductive arguments, for if an argument is valid and the premises true, it follows that the conclusion must also be true. Thus, valid arguments are exactly those suitable for what may be the paradigm application of deductive arguments: establishing the truth of the conclusion on the basis of the truth of the premises. The conclusion of a valid argument is said to be a ‘tautological consequence’ of the premises.

There are other desirable features for an argument to have: to establish the truth of its conclusion, the premises must be true; and to be part of an explanation of its conclusion, its premises must in some sense be better known or understood than the conclusion, and, in particular, the argument must not be circular. We do not discuss such secondary features further here. For the most part, they are only requisites of arguments employed for specific purposes, unlike validity, which is a condition for acceptability of any deductive argument. The notion of validity relies on a notion of possibility that is surely in need of further analysis (but see below).

There are arguments whose validity is not purely logical. For example, ‘Caila is a female child, therefore Caila is a girl’ is valid because a female child is necessarily a girl, although that fact does not appear in the argument. This argument has the ‘form’ ‘ $F(c) \wedge C(c)$, therefore $G(c)$’. But so does ‘Caligula was a famous caesar, therefore Caligula was a god’, which is clearly not valid, since the premise is true and the conclusion false. In contrast, the argument ‘Everyone is mortal, therefore Socrates is mortal’ is itself valid and so is every other argument of the form ‘ $(\forall x)M(x)$, therefore $M(s)$’. Here the validity of the argument does not depend on anything beyond its form, and in particular not on its subject matter: the reasons for its validity are ‘topic neutral’. That has often been taken to be a criterion for something to be logical. (See Haack (1978) for a historical summary of views on what counts as logical, and Sher (1991) and Koslow (1992) for recent work on the subject.)

The primary business of logic is to characterize those arguments which are not only valid, but of a form such that

every argument of that form is also valid; briefly, those which are 'logically valid'. It is obvious that logical validity depends on a prior notion of form (see Logical form). The sentences of the pure predicate calculus are designed to serve as representatives of forms of sentences of natural language, and the notion that an argument is of a certain form can be made more precise using the idea of a 'natural-language interpretation'. For example, 'Caila is a female child, therefore Caila is a girl' is of the form '$F(c) \wedge C(c)$, therefore $G(c)$' under the interpretation that interprets '*c*' as 'Caila', '*F*' as 'is female', '*C*' as 'is a child' and '*G*' as 'is a girl'; but it is also of the form '*A*, therefore *B*' under the interpretation that interprets '*A*' as 'Caila is a female child' and '*B*' as 'Caila is a girl'.

The same argument may have many forms. In general, a natural-language interpretation of an argument form must specify a name or definite description for each constant and a predicate for each predicate symbol. A predicate amounts to little more than a sentence with a single blank in it: '__ is female'. Each *n*-placed relation symbol will similarly be interpreted using an *n*-ary 'sentence form' - a sentence with *n* blanks in it. A binary relation symbol might be interpreted using, for example, '__ is spicier than __'. One needs some mechanism for specifying which term following a relation symbol corresponds to which blank in the sentence form that is its interpretation, but such details will be omitted here.

It follows from the stipulations above that an argument is logically valid if and only if it is of a form that yields a valid argument under all natural-language interpretations. Such a form will be called a valid argument form, and the problem of determining which arguments are logically valid thus amounts to that of determining which argument *forms* are valid.

It is tempting to suppose that an argument form is valid just in case it has no natural-language interpretation that yields an argument with true premises and a false conclusion. That would eliminate the troublesome notion of possibility from the basis of logic. Indeed, Carnap (1934) made proposals along closely related lines. Unfortunately, such a proposal does not serve as an adequate criterion for validity: as Tarski (1936) pointed out, it might be that our language happened not to be rich enough to give rise to the requisite variety of interpretations, and thus the validity of an argument could depend on the richness of parts of the language that were not used in the argument in question. It can in fact be shown that the language of arithmetic is rich enough to yield all the interpretations one could need for the predicate calculus presented here (see Kleene 1952 and Hasenjäger 1953), but it would be question-begging to assume it at the present stage.

3 Sentential logic

Since validity is defined in terms of whether or not the premises of an argument form can be true while the conclusion is not, it is first necessary to specify under what circumstances a sentence is true. We assume every sentence has a 'truth-value' of either T or F, where F is anything other than true - which may include, depending on one's view, not only false, but also meaningless, undefined and perhaps other possibilities. (Any sentence that is not true will be referred to, briefly though perhaps inaccurately, as false. For calculi allowing more than these two truth-values, see Many-valued logics.)

It is illuminating to begin with the simple case of 'sentential logic' (also called the propositional calculus); that fragment of the predicate calculus without variables, constants or quantifiers, and in which one only allows zero-placed relation symbols. According to the definitions given in §2, an atomic sentence is formed by such a symbol followed by zero terms. It thus amounts to no more than a single 'sentence letter'. It is possible to specify the form of some arguments in sentential logic. For example, 'Jane Austen and Charlotte Brontë were novelists, therefore Jane Austen was a novelist' has the form '$A \wedge B$, therefore *A*'. But many arguments cannot be formalized in sentential logic so as to be valid. For example, 'Everyone is mortal, therefore Hannah Arendt is mortal', has the form '$(\forall v)R^1(v)$, therefore $R^1(c)$', but this is not a form available in sentential logic. The only form available in sentential logic is the invalid '*A*, therefore *B*'.

The truth-value of a sentence of sentential logic is determined by an assignment of truth-values to its constituent sentence letters, through the following inductive rules. The negation of a sentence is false if the sentence is true, and true if the sentence is false. The conjunction of two sentences is true if both are true, and false otherwise. The disjunction of two sentences is true if at least one is true, and false otherwise. A conditional $\phi \to \psi$ is true unless ϕ is true and ψ is false. A biconditional between two sentences is true if both sentences have the same truth-value

and false otherwise. The idea of treating the truth-value of complex sentences as a function of the truth-values of their components (see Compositionality) - the idea of 'truth-functional' connectives - dates back to the Stoics (see Logic, ancient §5). The treatment of negation, conjunction and disjunction as truth-functional is scarcely controversial, but the same cannot be said of the truth-functional treatment of the conditional and biconditional (see Counterfactual conditionals; Indicative conditionals).

The rules just given can be represented diagramatically in the following 'truth table':

ϕ	ψ	$\neg\phi$	$\phi\wedge\psi$	$\phi\vee\psi$	$\phi\rightarrow\psi$	$\phi\leftrightarrow\psi$
T	T	F	T	T	T	T
T	F	F	F	T	F	F
F	T	T	F	T	T	F
F	F	T	F	F	T	T

Let us use the table to compute the truth-value of $((A\leftrightarrow B)\wedge A)\rightarrow(\neg B)$, given values for *A* and *B* of T and F, respectively. The truth-value of $A\leftrightarrow B$, according to the table, is F. But then, applying the rule for $\wedge$ to that and the given value for *A*, the truth-value for $(A\leftrightarrow B)\wedge A$ is also F. Since the truth-value of *B* is F, that of $\neg B$ is T. Finally, applying the rule for $\rightarrow$ to the last two facts, the truth-value of the whole sentence is T. This computation is represented by the following line of a truth table.

A	B	$A\leftrightarrow B$	$\neg B$	$(A\leftrightarrow B)\wedge A$	$((A\leftrightarrow B)\wedge A)\rightarrow(\neg B)$
T	F	F	T	F	T

A sentence that is assigned the value T on every line of its truth table is known as a 'tautology', a term introduced by Wittgenstein, who emphasized the importance of the method of truth tables.

Suppose Γ is a finite set of sentences and ϕ a sentence of sentential logic. It is then possible to construct a truth table that lists the truth-values of ϕ and all the sentences in Γ under all possible combinations of truth assignments to the sentence letters they contain. Now, suppose there is no line of that truth table in which all the sentences in Γ receive the truth-value T and the sentence ϕ receives the value F. Then the corresponding argument form 'Γ, therefore ϕ' is valid. For consider an arbitrary natural-language interpretation. The argument it yields must be valid - if not it would have to be possible for the premises to be true and the conclusion false. But that is not possible, by hypothesis. On the other hand, suppose that there is a line of the table on which all the sentences in Γ are true and ϕ is false. Then the argument form is not valid. For choose a line of the table of the type just assumed to exist. Consider a natural-language interpretation of the argument form that interprets each sentence letter by 'Snow is black' if it is assigned F on the selected line of the table, and by 'Snow is white' if it is assigned T on the selected line. The argument yielded by the interpretation just specified is one in which the premises are actually true and the conclusion is actually false. It is therefore not valid, and so the argument form is not valid.

This discussion demonstrates a remarkable fact: truth tables provide a precise criterion for whether or not an argument form in sentential logic is valid - it is valid just if there is no line of the table on which all the premises have value T and the conclusion has value F. (The troublesome notion of possibility has dropped out of the picture, since all that turned out to be relevant about possibility was the combinatorial list of possible ways for various simple sentences to be true or false.) Truth tables in fact constitute a mechanical decision procedure for whether an argument form of sentential logic is valid. For one can generate the table mechanically and then check it line by line.

Though truth tables provide a decision procedure in principle, it soon ceases to be a practically feasible one, since the number of lines of a truth table doubles with the addition of each sentence letter. The question of whether there is a more efficient procedure, in the sense that the difficulty of the computation grows as, for example, a polynomial function of the number of letters rather than an exponential one, is a version of perhaps the most important question in the theory of computational complexity (see Garey and Johnson 1979).

4 Expressive completeness

It might seem that the logic developed here is unduly limited in that it allows only five connectives. What about, for example, exclusive 'or', or the majority-of-three connective that holds among three sentences if and only if at

least two of them are true? The 'expressive completeness theorem' for sentential logic shows that the limitation is only an apparent one: every truth-functional connective, specified by any truth table whatever, is definable using those already introduced.

The proof of 'expressive completeness' (often called functional completeness) can be illustrated using the majority-of-three connective as an example. The sentence formed by applying it to *A*, *B* and *C* has the same truth table as

$$(A \wedge B \wedge \neg C) \vee (A \wedge \neg B \wedge C) \\ \vee (\neg A \wedge B \wedge C) \vee (A \wedge B \wedge C),$$

a disjunction whose components correspond to the four possible ways in which the majority-of-three connective creates a true sentence, these being read off the lines of the truth table. This example is in 'disjunctive normal form', that is, a disjunction of conjunctions of sentence letters and their negations. One can alternatively express an arbitrary truth table by a sentence in 'conjunctive normal form', that is, a conjunction of disjunctions of sentence letters and their negations. (The majority-of-three connective becomes $(A \vee B) \wedge (B \vee C) \wedge (C \vee A)$.) Any truth table can similarly be expressed using only 'and', 'or' and 'not'.

It follows that any set of connectives that can be used to define 'and', 'or' and 'not' is expressively complete. It is an elementary exercise to show in this way that negation plus any one of $\vee$, $\wedge$ or $\rightarrow$ is expressively complete. The binary connective that forms a true sentence if and only if both components are false ('not or') is also expressively complete, as is the one that forms a false sentence if and only if both components are true ('not and'). These last facts were first published by Sheffer (1913), and expressively complete sets of connectives were classified by Post (1941) and Wernick (1942).

5 Truth and logical consequence

The next task is to extend the account of the truth-conditions of sentences to the full predicate calculus. The truth-value of an atomic sentence is determined by whether the objects denoted by the constants stand in the relation denoted by the relation symbol. This can be expressed mathematically by means of an 'interpretation function' that associates an object with each relevant constant symbol and a set of ordered *n*-tuples of objects with each relevant *n*-placed relation symbol. (Though natural-language interpretations and interpretation functions play similar roles - they fix how the constant and relation symbols are interpreted - they are not the same: a natural-language interpretation takes each symbol to a suitable item of natural language, while an interpretation function takes each symbol to a suitable set-theoretic object.) For example, the relation on persons specified by '__ is shorter than __' could be symbolized using R^2, which would then be taken by the corresponding interpretation function to the set *S* of all ordered pairs of persons in which the first person is shorter than the second. If *c* were to be interpreted as G.E. Moore and *d* as Kareem Jabbar, then R^2cd would take on the value T precisely because the ordered pair $\langle$G.E. Moore, Kareem Jabbar$\rangle$ is in the set *S*. The present method goes beyond that of natural-language interpretations in an important respect: an interpretation function can take a relation symbol to an arbitrary collection of ordered *n*-tuples, even though it might not be specifiable in ordinary language.

In an applied predicate calculus, one selects certain constant and relation symbols to stand for certain objects and sets of *n*-tuples, reserving the rest to function as schematic letters. One way of introducing integer arithmetic, for example, involves fixing symbols for zero, 'less than' and so on. One can then add to the axioms of a logical system special nonlogical axioms involving those symbols and even restrict the language to eliminate schematic letters.

The truth-value of a universally quantified sentence, say $(\forall v)R^2cv$ (which, on the above interpretation, reads 'G.E. Moore is shorter than everyone'), would be easy to characterize if every relevant object were the interpretation of some constant symbol. It would then be true if all the following sentences were: $R^2cc_0, R^2cc_1, R^2cc_2, \ldots$. But there is no reason to suppose that every relevant object has a name. Consider 'All ravens are black' - surely not every raven has a name. And certainly, no one language could name all the uncountably many real numbers. Nonetheless, each relevant object could be given a name, and so the following works. First, specify a non-empty set to be the domain of the quantifiers (persons, ravens, real numbers,…). Second, specify a new constant that has not been employed in any of the sentences under consideration. For our

example, the domain is to be persons and the constant might be *d*. Then, continuing the example, $(\forall v)R^2cv$ is true if R^2cd is true no matter how the interpretation so far specified is expanded by interpreting the constant *d* as standing for a member of the domain.

It is now possible to give a precise definition of how the truth of sentences is determined. A 'language' (sometimes called a signature or similarity type) is a set of constant and relation symbols. (A language might better be called a vocabulary, but the terminology is standard.) A 'structure' (or 'interpretation') for a language $\mathcal{L}$ is an ordered pair with first member a non-empty collection - the 'universe' of the structure - and second member a suitable (in a sense defined immediately below) function with domain $\mathcal{L}$ - the 'interpretation function' of the structure. (The language is thus determined by the structure, being the domain of the interpretation function.) The interpretation function is required to map every constant symbol in $\mathcal{L}$ to a member of the universe, every sentence letter to a truth-value, every predicate symbol to a set, and every *n*-placed relation symbol, for *n* greater then 1, to a collection of ordered *n*-tuples of members of the universe.

When symbols with a fixed usage are in the language $\mathcal{L}$, one must require that the relevant objects be in the universe and that the interpretation function map such symbols to the correct objects and relations. We can avoid such complications by considering only languages that contain nothing but schematic letters. Arithmetic, for example, is then considered in terms not of a particular language but of a particular structure, and the axioms of arithmetic, because they will be written using schematic letters, will have interpretations and interpretation functions in addition to the main one.

If A and A' are structures with the same universe such that the language of A' includes the language $\mathcal{L}$ of A and possibly some other symbols, and if the interpretation functions of the two structures agree on $\mathcal{L}$, then A' is said to be an 'expansion' of A. When one structure is an expansion of another it differs only in that it may possibly expand the interpretation function to contain some additional symbols in its domain. Note that if *d* is some definite constant symbol not in $\mathcal{L}$, then for every member *a* of the universe of A there is an expansion in which the interpretation of *d* is *a*.

The truth-value of a sentence in a structure is defined by the following conditions on all structures A and sentences ϕ of the language of A:

(1) (a) If ϕ is of the form $c_i = c_j$, then the truth-value of ϕ in A is T if the interpretations of c_i and c_j in A (that is, the values of the interpretation function on c_i and c_j) are the same, and the truth-value is F otherwise.
(b) If ϕ is a sentence letter, its value in A is the truth-value to which it is mapped by the interpretation function.
(c) If ϕ is of the form $R^n c_1 \ldots c_n$ with $n > 0$, then the truth-value of ϕ in A is T if the *n*-tuple formed from the interpretations of $c_1, \ldots, c_n$ (in that order) is a member of the interpretation of R^n (which, recall, is a set of *n*-tuples) and it is F otherwise.
(2) If ϕ is a negation, conjunction, disjunction, conditional or biconditional, then its truth-value is determined from those of its constituents just as in sentential logic.
(3) If ϕ is of the form $(\forall x)\psi$, $\mathcal{L}$ is the language of A and $\mathcal{L}'$ is the language obtained from $\mathcal{L}$ by adding some definite constant symbol *d* not in $\mathcal{L}$, then the value of ϕ is T if the truth-value of the sentence $\psi(d)$ obtained from ψ by replacing every free occurrence of *x* by *d* is T in every expansion of A to a structure for $\mathcal{L}'$. The truth-value is F otherwise.
(4) If ϕ is of the form $(\exists x)\psi$, $\mathcal{L}$ is the language of A and $\mathcal{L}'$ is the language obtained from $\mathcal{L}$ by adding some definite constant symbol *d* not in $\mathcal{L}$, then the value of ϕ is T if there is at least one expansion of A to a structure for $\mathcal{L}'$, in which the truth-value of the sentence $\psi(d)$ obtained from ψ by replacing every free occurrence of *x* by *d* is T. It is F otherwise.

It is now possible to define, as Tarski did (1936), logical consequence and logical truth for the predicate calculus in a way parallel to the definitions of tautological consequence and tautology given above. Let the language $\mathcal{L}$ contain only schematic letters. Let Γ be a set of sentences of $\mathcal{L}$ and ϕ a sentence of $\mathcal{L}$. Then ϕ is a 'logical consequence' of Γ if there is no structure for $\mathcal{L}$ in which every sentence in Γ has value T and ϕ has value F; and ϕ is a 'logical truth' if it receives value T in every structure for $\mathcal{L}$. As in the case of sentential logic, one can establish that an argument formalized in the predicate calculus is logically valid just if the formalization of the conclusion is a logical consequence of the formalizations of the premises. In this characterization of logical

validity, the precise mathematical notion of a structure has replaced the troublesome notion of logical possibility.

For technical variants of the semantics presented here, including the idea of extending the language by giving the existing variables the role played here by the added constants, see Tarski (1936) and the textbooks by Mates (1965) and Tennant (1978). The customary semantics excludes the possibility of an empty universe or of constants that do not denote any individual, but both can be accommodated at the cost of some complication (see Free logics).

It is immediate from the definitions that in any structure, if *c* and *d* denote the same individual and ϕ is true, then so is the result of substituting *d* for any or all occurrences of *c* in ϕ. Likewise, relation symbols denoting the same set of ordered *n*-tuples, predicates denoting the same set, and sentences with the same truth-value, can all be substituted for one another without changing the truth-value. In short, the predicate calculus is 'extensional' through and through. Some natural-language forms are extensional, others not. Since 'Fibonacci' and 'Leonardo of Pisa' denote the same man and Fibonacci was a mathematician, it follows that Leonardo was a mathematician; but someone may know that Fibonacci was a mathematician without knowing that Leonardo was, so 'knows that' generates forms that are not extensional. The predicate calculus is not adequate to deal with such cases (see Intensional logics), but even within the extensional sphere, there is no counterpart for the predicate calculus of the expressive completeness theorem for sentential logic. It will in general be true that for a given structure there will be relations on the structure not definable in the language of the structure, structures indistinguishable by any sentence, and more classes of structures for a language than there are sentences of the language.

As for the definability of quantifiers, many are indeed definable with the help of the equality sign, including 'there are *n* things such that' for each finite number *n*. But the quantifier 'for finitely many' cannot be defined in the first-order predicate calculus. It requires the resources of second-order predicate calculus, in which the quantifiers range over relations of objects as well as over individual objects (see Second-and higher-order logics).

6 Formal deduction and decidability

As an alternative to the semantic approach adopted above, the inferential role of the various logical constants can be specified by codifying a system of rules for deduction and proof. The idea goes back to Aristotle, though the first fully rigorous system is that of Frege (1879), with his insistence that there be absolutely no room for doubt or disagreement whether a putative proof is in accordance with the rules or not. Some have gone further and taken purely syntactic rules for the manipulation of the logical constants to be constitutive of their meanings, and systems of this sort have been used to introduce intuitionistic logic as well as the 'classical' logic expounded here (see Intuitionism; Natural deduction, tableau and sequent systems).

There are many varieties of deductive system (see Formal languages and systems). The axiomatic variety is conceptually the simplest. A number of logical axioms are laid down, together with rules of inference of the form 'From $\phi_1, \ldots, \phi_n$ infer ψ' for suitably related ϕs and ψ. A common choice is to take the rule of *modus ponens*, 'From ϕ and $\phi \rightarrow \psi$ infer ψ', as the sole rule of inference, supplemented by numerous axioms to offset the absence of other rules. A formal deduction of a conclusion from a set of premises is defined as a finite sequence of sentences which ends with the conclusion and of which every member is either a logical axiom or a premise or else follows immediately from preceding members by a rule of inference. Formal proof is introduced as the limiting case of a deduction from the empty set of premises. A sentence is said to be 'deducible' from others in the system if there exists a formal deduction of it from them, and a sentence is a theorem if there exists a formal proof of it. Church (1956) gives a survey of axiomatic systems for sentential logic and for predicate logic. The latter generally invoke an extended deductive apparatus that covers formulas with free variables as well as sentences proper, but Quine (1955) presents an axiomatic system confined strictly to sentences.

Natural deduction systems include a more sophisticated kind of rule, designed to exploit assumptions - propositions assumed for argument's sake and treated as extra premises for as long as they are wanted. Proof by *reductio ad absurdum* is a good informal illustration of the idea: wishing to prove ϕ, one supposes for argument's sake that it is false and tries to derive a contradiction, whereupon one discards the assumption and infers that ϕ must be true. The definition of formal deduction now has to keep track of the introduction and subsequent discharge (discarding) of assumptions; see, for example, Lemmon (1965). This complication is, however, offset by there being fewer or even no axioms, and by the comparative naturalness and brevity of

deductions. (For this and some related kinds of deductive system see Natural deduction, tableau and sequent systems §1.)

To be adequate for its purpose, any deductive system must satisfy two conditions. It must be ‘sound’, in the sense that it does not license deductions whose conclusions do not follow logically from their premises. And it must be ‘complete’, that is, strong enough to ensure that every logical consequence of a set of sentences is deducible from them. When a system is both sound and complete, deducibility becomes equivalent to logical consequence and likewise theoremhood is equivalent to logical truth. Of the two conditions, completeness is nearly always much more difficult to establish. The first proof of the completeness of a deductive system for the predicate calculus was given by Gödel (1930; see also Model theory §4), while Henkin (1949) devised a novel method of proving completeness that has found applications far beyond its original one to the predicate calculus. Although second- and higher-order predicate calculi have significantly more expressive capacity than first-order, their great drawback is that there can never be a sound and complete deductive system for them (see Second- and higher-order logics §1). The dominant position of the first-order calculus is the result of its being rich enough to formalize a vast range of arguments from mathematics and elsewhere, yet simple enough for all its valid argument forms to be reducible to a few simple rules of inference.

If a sentence of the predicate calculus is a logical consequence of others, that fact can be shown by deriving it from them in a sound and complete deductive system. Although in practice this may require considerable ingenuity, in principle a machine can generate a list of successive finite sequences of sentences on which sooner or later the right one - by hypothesis there is a right one - will turn up. Nonetheless, the method of formal deduction does not provide a decision procedure for logical consequence. The fact that a deduction has not yet turned up means nothing. For there is in general no way of telling whether this is because no such deduction exists - that is, the conclusion in question is not a logical consequence of the premises - or whether it is merely that we have not tried hard or long enough. If we could find a counterexample - a structure in which the putative conclusion is false while the premises are true - that would indeed show that it is not a logical consequence of them. But the parallelism between truth tables and structures breaks down at this point. In sentential logic all one has to do is set out the relevant truth table and inspect its rows. There will, however, always be infinitely many relevant structures, not to mention structures with infinitely many objects. The analogue of setting out and inspecting the rows of a truth table thus involves infinitely many steps and cannot be carried out even in principle.

This strongly suggests the absence of a decision procedure for the predicate calculus, and Church has proved that none exists. However, positive results can be obtained in some restricted cases, the simplest and most important example being that there is a decision procedure for the monadic predicate calculus, that is, the fragment whose language includes predicate symbols but no *n*-placed relation symbols for $n > 1$. (See Church’s theorem and the decision problem.) For further results of this sort, see Dreben and Goldfarb (1979). Many interesting questions concerning feasibility and quantificational logic arise (see Börger 1989).

Predication

Some sentences have a very simple structure, consisting only of a part which serves to pick out a particular object and a part which says something about the object picked out. Expressions which can be used to say something about objects picked out are called predicates. Thus 'smokes' in 'Sam smokes' is a predicate. But 'predication' may refer either to the activity of predicating or to what is predicated. To understand either we need to know what predicates are and how they combine with other expressions.

Predicates, unlike proper names, can be negated. They combine with other expressions in ways described by categorial grammar: predicates are incomplete and are completed by other expressions, such as proper names. The word 'smokes' in 'Sam smokes' is called a monadic or 1-place predicate; predicates with two or more places are called relational predicates ('Sam loves Erna', '3 is between 2 and 4').

Since Frege it has been customary to hold that the incomplete or predicative parts of 'Sam smokes' and 'Sam is a smoker' are, respectively, 'smokes' and 'is a smoker' (see Frege, G. §§2-4). According to an older view, the incomplete part of 'Sam is a smoker' is the copula 'is', which is completed by two complete expressions, 'Sam' and 'a smoker' ('a' can be ignored as an accident of English). Sometimes called 'the two name theory of predication', this view allows two types of name - proper names and common nouns.

Is predication merely a matter of words? Are mental acts or the senses of words essential to it? For Frege, names and predicates are correlated with ideal senses, and the sentential wholes to which they belong with ideal thoughts or propositions (see Sense and reference §2; Frege 1892a). The sense or meaning of a proper name is sometimes called an individual concept, that of a predicate a concept (Frege himself used neither 'concept' nor 'meaning' in this way). It has been held that to use a predicate is to perform a mental act of predicating and that to use a proper name is to perform a mental act of naming or referring. Husserl and others appeal to both senses and mental acts and conceive of the latter as tokenings of the former. The unity of thoughts and of thinkings, on these views, resembles but is prior to the unity of the sentence: predicative senses require non-predicative senses; predicatings require referrings or acts of quantifying over individuals.

Predication occurs in the context of a variety of mental acts and linguistic actions: I may wonder or ask whether Sam smokes. So to predicate is not always to judge or assert. To assert that if Sam smokes he will smell is not thereby to assert that Sam smokes, although it is to predicate this of him in the context of entertaining or supposing the thought that Sam smokes.

Frege and Husserl pointed out that to deny that Sam smokes is just to assert that he does not smoke. Denying and judging are not on a par because 'not' belongs within the sentence, its sense to that of the sentence. There is, it is true, the phenomenon of polemic negation, as when the third word of the following sentence is stressed: 'Wittgenstein was not German'. But this is a pragmatic phenomenon.

What is it that is predicated? Just as names designate things, so too predicates are said to stand in a semantic relation (reference, signification) to one or more of the following: properties (attributes); what Frege (in his own technical sense) called 'unsaturated concepts'; sets; and relations between objects and possible worlds (see Semantics, possible worlds §9). Thus predication may be held to involve saying of Sam that he falls under the sense of the predicate 'smokes', exemplifies the property of being a smoker, or belongs to the set of smokers - or some combination of these. The semantic values of predicates and other parts of a sentence are sometimes said to form states of affairs or situations - which may or may not obtain - or facts.

The foregoing contains five simplifications and questionable presuppositions. First, does predication only occur within sentences (thoughts, thinkings)? If a builder shouts 'Slab!' to his assistant is he not producing a non-elliptic predication? Second, we may wonder, with Wittgenstein (1968), to whom the preceding example is due, whether there is in fact any uniform type of semantic relation between predicates, on the one hand, and properties and their ilk, on the other hand.

Third, the apparent (surface, grammatical) forms of predicates can diverge in different ways from their logical (deep) forms. To say that Pierre is tall is not to predicate the monadic property of being tall of him but to predicate,

of him and the average member of some reference class, the relational property of being taller than. Furthermore, if we accept the view (of Davidson; and of Parsons 1990) that many sentences involve quantification over events, then to say that Sam is smoking is to predicate of some event that it is an event of smoking and to predicate of it and Sam that Sam is the agent of it (see Adverbs §1).

Fourth, according to Ramsey (1990) there is no essential distinction, in 'Socrates is wise', between its subject and monadic predicate because the sentence expresses the same proposition as 'Wisdom is a characteristic of Socrates'. So no fundamental classification between individuals and properties can be based upon such a distinction.

Finally, if we take seriously the claim that predicates are incomplete, then we should say that in 'Sam smokes' the predicate is not 'smokes' but ' smokes', the gappy result of deleting the proper name from the sentence. Thus both 'Booth shot Lincoln' and 'Booth shot Booth' contain the predicate 'Booth shot '. But, as Geach indicates in his discussion of this example ('Quine on Classes and Properties', 1981: 222-5), the predicate here is not a physical part of the two sentences; it is a sentence pattern which 'Booth shot' helps to form. A related view is that such sentence patterns are abstract features of sentences, as melodies are of spoken sentences. But then we might wonder whether 'Booth ' is not just as much a sentence pattern as 'Booth shot '.
